AGITATION IN CHEMICAL ENGINEERING PRACTICE.*

THE CHOICE OF SUITABLE STIRRING DEVICES.

FUNDAMENTALLY, agitation is accomplished by applying force to a more or less fluid mass and then opposing the resulting movement in such a way as to alter its direction or otherwise emphasise its selective action on various parts of the mass. Movement must be brought about in parts of the mass in such a way as to force changes in the relative positions of its various particles. The means by which this result is accomplished in practice may be roughly classified into six groups: (1) simple paddles and modifications; (2) turbines and modifications; (3) propellers and modifications; (4) processes involving movement of the containing vessel; (5) combinations of two or more of the above; (6) miscellaneous unclassified types.

Paddle Agitators.

The simple paddle in the hands of a workman is seldom found profitable in modern operations, but frequently its immediate successor, single or multiple vanes mounted on a rotating shaft, is found quite efficient where movement need not be violent, as in those cases where liquids of very nearly the same specific gravity are to be mixed and where mixing is used as a means of aiding osmotic forces. Dissolvers and leachers of this class with slow-motion paddles are found to be efficient, as in these machines the problem is really the mixing of the strong solution in direct contact with the solute with the more dilute solvent.

Paddle agitators involve the application of force with two directional components, one in the direction of rotation and a second centrifugally and at right angles to the first. The rotating force is comparatively greatest and the centrifugal force least when the movement of the paddle is slow and tends to bring the mass as a whole into rotation at a speed approximating that of the paddle. Actual mixing in this event is comparatively slight. The inertia of the mass, as well as the resistance to rotation offered by the walls of the containing vessel, tends to start cross currents of various kinds and thus promotes some mixing. Increases in the resistance to this rotational motion are made by introducing stationary paddles or simple vanes projecting from the sides of the containing vessel in various ways which break up the otherwise solid stream of liquid caused by the rotating paddle. The centrifugal component of the applied force grows rapidly as the speed of rotation increases, and is ordinarily only opposed by the containing walls. The movement in the mass caused by this force is utilised more or less incidentally in the ordinary paddle mixer but becomes the principal force in turbine mixers. Motion from the centre toward the walls of the containing vessel is changed in direction at that obstruction into up or down motion following the wall, and is largely influenced by the strong rotational movement which is especially rapid at the periphery of the vessel. Few machines are now built which are of the simple paddle type, as most builders incline the paddles in such a way as to add a force component in the direction of the paddle's axis.

Combinations of paddles are frequently used. Two paddles mounted to revolve in the same direction at the foci of an elliptical vessel, three paddles in a clover-leaf vessel, etc., generate conflicting currents in the liquid and bring about very efficient mixing in many processes. The mounting of two sets of paddles on the same axis to revolve in opposite directions has been found to consume a disproportionate amount of power. The use of single or multiple sets of paddles mounted eccentrically in cylindrical tanks gives economical mixing in many cases where a centrally mounted paddle would result in a simple rotation of the mass without real mixing. Inclining the axis of a cylindrical vessel with a simple paddle revolving in its centre produces a marked increase in mixing by utilising gravitational force.

Stirrers of the Turbine Type.

The turbine type agitator is really a special case of the paddle type, but since the principal force used is centrifugal rather than rotational, it must be considered separately In this type of agitator the rotating unit is so designed as to minimise the rotational component of force and increase the centrifugal component to a maximum. Its operation is in

* Abstract of paper by D. H. Killeffer in *Industrial and Engineering Chemistry*. February, 1923.

all respects similar to that of a centrifugal pump, with the exception that the motion of the liquid is permitted in every radial direction instead of being forced in a single direction by a casing or pipe. The radial currents are directed toward and up along the walls of the containing vessel by placing the turbine itself close to the bottom. In general, the speed of the rotating member is high and sufficient force can be communicated to the liquids to bring about efficient mixing of liquids of widely differing specific gravities. Its use is practically limited to liquids of low viscosity and to those which do not contain solids except in very finely divided form. Its efficiency depends upon the mobility of the liquid and upon giving it a high velocity.

Usually, turbine mixers are most efficient when placed in the centre of the bottom of cylindrical tanks in such a way as to permit free movement of the radial streams to the walls of the vessel where they are turned in a vertical direction. The flow of liquid in this case is down in the centre to the impeller, out along the bottom to the sides of the tank, up the sides and thence to the centre at the surface of the liquid. The impeller itself is provided with a partial casing so arranged that the supply of liquid to the vanes is taken in near the centre and forced directly out toward the periphery through the guiding effect of vanes in the partial casing. In some cases, especially where the liquids to be mixed are of nearly the same specific gravity and where the volume to be mixed is large, it is advantageous to elevate the impeller unit from the bottom to the centre of the tank, as here two whorls are started, one above and one below the impeller.

Developments in Propeller Mixers.

Ship-propeller agitators introduce a third force component in a vertical direction to those already considered, and it is through the emphasis of this component to the detriment of others that such agitators are made efficient. A simple propeller set in the centre of the mass of liquid imparts motion to it in each of three directions, horizontally, rotationally, and vertically with respect to the propeller. At slow speed these effects are negligible, but they increase rapidly with the velocity of rotation, until a point is reached at which the resistance to motion, and hence the power consumed, becomes too great to permit efficient operation. The efficient speed of the propeller is ordinarily intermediate between those of the turbine and the simple paddle.

The first step in limiting the effects of the rotational and centrifugal components was to reduce the first by altering the shape of the containing vessel by vanes more or less vertically placed on its sides, or by otherwise altering it to increase the resistance to rotation. From this it was an easy step to place these vanes in a vertical open tube closer to the propeller than the walls of the vessel, in such a way as to limit both the rotational and centrifugal forces to action on a small part of the mass while permitting the vertical component to act freely on the whole. These draught tubes, as they are called, force high-velocity streams of liquid in a vertical direction, and it has been generally found that this method gives the greatest mixing of two liquids of markedly different specific gravities, such as acids and hydrocarbons. Since such reactions as nitration are strongly exothermic, the mass of liquid must be moved rapidly past large cooling surfaces. One type of agitator has been developed especially to accomplish this end. Here the propeller is placed in a tube outside the main container and a great mass of cooling coils is located in the main vessel. The inlet and outlet of this tube are so arranged that the stream of liquid through it causes a more or less pronounced swirl in the main volume around and through the mass of cooling coils. The effect of the marked difference in specific gravity of the liquids to be mixed is largely offset by introducing one of them, usually the hydrocarbon, at a point in the draught tube just before the stream comes to its point of greatest agitation at the propeller.

Still other makers of agitators find a propeller provided with a narrow ring around its circumference highly efficient in producing a maximum vertical component, with little energy wasted in the other two directions. Another type has two propellers mounted on the same shaft in such a way as to revolve in opposite directions, yet producing parallel vertical components. Here the rotational component is minimised by the action of the two opposed propellers, and a pronounced vertical flow is achieved, while the centrifugal component is neglected. The neglect of the latter feature is generally considered of little consequence, but it is conceivable that it might be more efficiently used than in present machines of this type. Other modifications of the application of the propeller principle involve setting one or more eccentric in much the same way as described for paddle stirrers, inclination of the containing vessel, multiple blades, propeller mounted on the same shaft to rotate in the same direction but to produce vertical components in opposite directions, continuous screws set in less fluid masses, and so on through every conceivable variation as varied in type and design as the engineers who have studied the question. The universal appeal of the propeller type agitator to the imaginations of designers is well borne out by even the most cursory survey of the field.

Moving Vessel Agitators.

The types of agitating devices so far considered lend themselves most readily to fluid masses but are decidedly less efficient in handling viscous masses. Usually such masses must be mixed slowly, and it is frequently found best to accomplish this by making use of the force of gravity. The mixture to be agitated is placed in a more or less cylindrical vessel which can be rotated about a horizontal axis. In this case the rotation of the container raises the mass by degrees, and its fall from slight elevations brings about the desired mixing. The vessel may be cylindrical, in which case it is usually provided with projections toward the centre from its inside periphery, or it may assume a variety of shapes from spherical to cubical that will assist the operation of raising parts of the mass and allowing them to fall back into the original mass, their relative positions being thus altered. Cement kilns and barrel dissolvers used in shellac manufacture are the simplest practical machines of this type. The ball mills are modifications of the same principle since they include balls to assist the motion in the mass as well as to perform the grinding operation.

The majority of agitators for mixing viscous masses—apart from those mentioned above, the application of which is not limited to this use—are modifications of the simple paddle mixer with some propeller action so altered as to permit the application of the greater forces required. In general, the principles involved are the same after allowance is made for the lack of fluidity of the mix and the consequently greater power requirement. As an engineering problem, however, viscous mixing presents many problems not involved in mobile mixing.

Combination Agitators.

Combinations involving two or more of the foregoing types of agitating devices may be found in most machines as commercially used. The combinations and their applications are as numerous as the uses to which they are put, as it is seldom that the operating engineer finds a tool ready built to suit his particular need, in spite of the variety offered by makers. Combinations of simple paddles with propellers and of turbines with propellers in greatest variety are to be found in most plants, yet the principles underlying them are much the same. One of the force components possible is emphasised at the expense of others. This practice has become so common that it is indeed difficult at present for one to find machines made in which the agitation is accomplished by a device which does not involve a variety of principles.

Various types of devices are encountered in special fields which do not involve any of the principles so far discussed. Blowing a gas through a liquid mass is often used for agitation where the interaction of the gas with the mass is either desired or not objectionable, as in the cases of the aeration of sewage and mixing of strong mixed acids, where it is desirable to blow out oxides of nitrogen. Many combinations of fluid streams, either liquid or gas, with paddles and propellers are met in practice. The stirring of a liquid being electrolysed in an electrolytic cell by surrounding it with a magnetic field has been found to be very highly efficient in many electrolytic operations where the presence of any foreign substance in the electrolyte is objectionable. The cascade principle is often applied to operations not usually considered agitation, as where it is desired to dissolve a solid in a liquid in the lixiviation of ores. Still another form which agitation takes is well illustrated in washing an immiscible liquid with water by pumping the heavier, in a stream more or less broken, into the lighter, as in washing nitrobenzene with water to free it from acid. The circulation is accomplished by a pump of any efficient type, although usually centrifugal, in a system virtually independent of the containing vessel which draws liquid from the bottom of the mass, and pumps it in again at the top through some kind of a spray head.

SUMAC PRODUCTION AND TRADE.*

COMPETITION BETWEEN SICILIAN AND AMERICAN PRODUCTS.

THE sumac of commerce consists of the dried leaves, leaf stems, and stalks from various plants of the *Rhus* family, which are found abundantly in almost all regions of the temperate zones. These varieties, however, do not all possess the same value as tanning agents. The principal European species, and most valued for their tannin content, are the Sicilian sumac (*Rhus coriaria*) and that from central Italy (*Rhus cotinus*), which varieties are also found in Yugoslavia; the sumac of France, Spain, and Greece belongs in the same category. American sumac is obtained from various species of *Rhus*, the best being that known as white sumac, derived from *Rhus glabra*; dwarf sumac, from *Rhus copallina*; and staghorn sumac, from *Rhus hirta*. There are several other varieties, but their yield of tannic acid is insufficient to render them commercially valuable.

Sumac is found abundantly in the United States, and is especially accessible east of the Mississippi River, from Maine to Georgia. Sumac is harvested on a large scale in Virginia, North Carolina, Maryland, and Pennsylvania. The American plant, owing to careless gathering and curing, gives a darker coloured leather than the sumac imported from Sicily, and, since sumac is mainly used for tanning light-coloured leather, this characteristic renders the American product less desirable than the Sicilian and therefore decreases its value.

Tannin Content of Sumac.

The leaves of the upper extremities of the stalks are always richer in tannic acid than those of the base; and the increase in the age of the plant is accompanied by a general diminution in tannin. The colouring matter in the leaves has an important influence in determining the value of the product. The portions of the plant usually considered of value for tanning purposes are the leaves and the stems; but as the stalks contain from 5 to 10 per cent. tannin—an amount too large to discard,—an extract could be made from them and the off-coloured leaves that would be a satisfactory tannage where colour is not of premier importance.

The tannin content of good sumac ranges from 25 to 28 per cent.; although some samples have, on analysis, been found to contain from 32 to 35 per cent. of a tannin allied to gallotannic, with some ellagitannic acid, and a colouring matter which gives yellows with alumina and tin mordants. Similar analyses have proved that the tannin content of dwarf sumac ranges from 19 to 35 per cent.; that of staghorn, from 21 to 30 per cent.; and that of white sumac from 21 to 28 per cent.

For white or light-coloured soft leathers, sumac is the best tannage known. It is also used for brightening leathers of darker tannages, such as mimosa and gambier, the colouring matters of which warm sumac liquors readily dissolve. Sumac-tanned leathers are less liable to decay than those of other tannages and are largely used for bookbinding, and other purposes in which durability is a primary requisite.

Extracts occur as liquids of 42° and 51°, containing about 22 and 26 per cent. of tannin respectively. The American production of sumac extract from both native and foreign leaf in 1914 amounted to 4,512,361 pounds; and in 1919 (the latest year for which statistics are available), to 4,507,433 pounds. The domestic consumption however, of the prepared extract in 1919 aggregated 6,669,642 pounds together with 4,656,000 pounds of raw sumac representing a total of 11,325,642 pounds.

United States Import Trade.

The marked tendency of American tanners has been to import less and less of the prepared extract both during the war and since. In 1913 for example there were imported into America 14,489,000 pounds of ground and unground sumac and 1,270,000 pounds of sumac extract. In 1917, the corresponding figures were 11,637,000 pounds and 161,000 pounds and in 1922, 12,378,000 pounds and 39,000 pounds.

Comparison of the American receipts of sumac for the first five months of 1923 with those of the corresponding period of 1922 would indicate that the total imports for 1923 will register a considerable increase over the preceding year, and that the preponderance of favour continues on the side of the ground product. The total imports of both ground and unground sumac during the January-May period of 1922 were 3,138,012 pounds; while the imports for the corresponding period of 1923 aggregated 9,031,680 pounds, or 73 per cent. of the total imports for the whole year of 1922. Italy has a virtual monopoly of this trade, the participation of other countries therein never having exceeded 4 per cent. in any year since 1919 when American imports of sumac were 100 per cent. Italian.

Decrease in Sicilian Output.

Sicily is the largest producer of sumac in the world, followed by the United States. The production, however, has considerably decreased within the past few years, owing to the cessation of cultivation during the war, and, since then, to the increased cost of labour and transportation which have been out of proportion to the rise in price of sumac. However, this situation may be only temporary. While formerly the annual output varied from 40,000 to 60,000 tons, it has ranged from 20,000 to 30,000 tons per annum within recent years. Palermo, the capital of Sicily, is the main distributing centre for sumac. This product is usually purchased from the small growers by middlemen who hold it for favourable market conditions. The output of Sicilian sumac for 1922 was considerably under that of the average year, not exceeding 20,000 tons. This yield was, however, of superior quality.

Italy's Export Trade in Sumac.

The foreign trade in Sicilian sumac for 1922 was exceptionally good, the United States being the principal market, followed by France, Great Britain, and Germany as active purchasers. So brisk was the buying for the 1922 crop that stocks have dwindled greatly during first half of this year. The following table gives the official statistics for the total exports of Italian sumac for the years 1913-1922, and the shares of the principal countries participating therein:

EXPORTS OF ITALIAN SUMAC FOR 1913–1922, WITH PRINCIPAL COUNTRIES OF DESTINATION.

Years.	Total Exports.	Exported to—			
		United States.	Great Britain.	France.	Germany.
	Kilos.	Kilos.	Kilos.	Kilos.	Kilos.
1913	23,724,900	3,841,800	6,660,900	6,205,800	926,900
1914	19,698,000	5,415,100	5,982,500	2,540,000	1,240,800
1915	21,336,100	7,178,900	6,537,100	4,830,100	1,291,700
1916	20,182,900	7,433,100	5,740,400	5,287,800	—
1917	16,779,800	6,315,300	5,247,200	3,872,000	—
1918	15,165,600	5,505,700	5,952,100	2,461,900	—
1919	19,191,600	7,647,300	3,927,900	4,500,700	237,300
1920	19,300,500	4,769,700	6,480,000	4,842,100	1,002,100
1921	14,240,100	*	*	*	*
1922	20,546,100	6,361,900	5,050,400	5,201,300	2,186,200

* Figures not available.

Price Fluctuations in Recent Years.

The price of American extract, which usually contains about 25 per cent. of tannin and is sold on a basis of its tannin content, has increased materially in recent years. In 1914 the quoted price per pound was about 3¾ cents; in 1915 it ranged from 3¾ to 9 cents; in 1916, from 5½ to 10 cents; and in 1917 and 1918 the price fluctuated in the neighbourhood of 5 cents per pound.

The trend of prices for Sicilian sumac has been consistently upward since 1913. In that year pure Sicilian sumac with a guaranteed content of 28 per cent. of tannin was quoted c.i.f. New York, Boston, or Philadelphia at 53 to 56 dollars per ton in the first half of the year and at 58 to 65 dollars per ton during the remaining six months. In 1914 and 1915 prices fluctuated between 63 and 65 dollars per ton for ground and 2.43 dollars a ton higher for leaf sumac, because of additional freight cost. In 1918 Sicilian sumac reached a peak of 105 dollars per ton at the principal Atlantic ports. In 1920 prices varied from 80 to 85 dollars per ton c.i.f. New York. In 1921 demand was very light, owing to the world-wide industrial depression of that year, and as a consequence prices receded to 55 and 50 dollars per ton. In 1922, however, greater activity in the leather industry considerably increased the foreign need for sumac, which resulted in prices fluctuating between 60 and 70 dollars per ton. New York quotations for July, 1923, show a still further gain, prices reaching the 1920 level of 85 dollars per ton for spot Sicilian sumac and 80 dollars per ton for the domestic product.

* Report by H. M. Hoar, of the Hide and Leather Division of the U.S. Bureau of Foreign and Domestic Commerce. Abstracted from *Commerce Reports*, July 30, 1923.

CASEIN IN THE PAINTS INDUSTRY.*

USE AS A BINDER IN DISTEMPERS.

(Continued from page 220.)

IN addition to the casein, water colours of the class under consideration always contain inert or loading materials. These are mineral matters, almost always white, such as China clay, powdered chalk, talc, hydrated lime, and barytes. As for the pigments themselves the majority of the colours generally used in washes may be applied. The following may be especially mentioned:—*White*: barium sulphate, white lead, zinc white, lithopone. *Red*: vermilion, vermilionettes, Indian red, chrome red, madder lake. *Yellow*: Naples yellow, cadmium yellow, chrome yellow, yellow ochre, sienna. *Blue*: Paris blue, Bremen blue, cobalt blue, ultramarine, indigo. *Green*: chrome green, cobalt green, victoria green, permanent green, Schweinfurt green, malachite green. *Brown*: Cassel brown, brown ochre, sienna, umber. *Grey and Black*: ivory black, bone black, Paris black, lamp black. A large number of aniline lake colours are also capable of being utilised in the preparation of casein-containing paints. As a general principle it may be taken however that colours and pigments precipitated upon or mixed with calcium sulphate are not suitable for casein paints, since in contact with water such a paint would quickly scale and peel off.

Grinding and Mixing the Paints.

The casein, filling material and pigment are ground up separately into fine powders and then sieved. The sieving is best effected mechanically in an apparatus consisting essentially of a shallow wooden vat, the bottom of which consists of a semi-circular sieve. A shaft lies horizontally above the sieve, and upon the shaft are mounted brushes which almost touch the sieve. The shaft is rotated by a crank and the brushes as they are turned, force the powder through the meshes of the sieve. The sieved materials are then mixed in a Werner and Pfleiderer "Universal" mixer of two differential speeds. As the operation comprises the mixing of powders of widely differing densities, it is advisable to commence with the machine at slow speed and then gradually to increase the speed, when a homogeneous mixture is obtained. As a type of a white wash with a basis of casein, the following formula may be given:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	120 kilos.
Fine Ultramarine Blue	0.15 kilos.

Use of Pure Lime Essential.

To obtain a good colour in this case, it is absolutely essential to use pure lime and, in fact, the only lime suitable, is the quicklime prepared from marble such as is utilised for the neutralisation of rosin in the preparation of varnish and siccatives. This lime, which is of a purity of from 99.0 to 99.5 per cent. should be slaked with three times its weight of hot water in an enamelled well-covered vessel. A simple test to discover whether the materials have been mixed to a condition of perfect homogeneity is to place a small sample of the powder on to a piece of damp glass. On pressing down this sample with the finger it should appear absolutely uniform when viewed through the glass.

Regulation of Casein Content.

Pigments of pale shade require less casein than dark pigments, and organic colours require less casein than inorganic colours. In addition the casein content of a good mixing ought also to be regulated by the nature of the surface to which the paint is to be applied. Thus on a permanent and resistant foundation such as zinc, cement, oil paint, cloth, boarding, and linoleum, the colour should contain more casein than on a foundation so unstable as plaster. In the latter case, where the tendency to scale is marked, the casein content is reduced and the lime content increased, especially when organic colouring matters are used. If the surface is very stable, such as wood or stone, the amount of casein in the mixing is so regulated that a sample of the paint coated on parchment dries without peeling when the parchment is bent or twisted, and also shows not the slightest sign of solution when dried for three days after treatment with a powerful jet of water.

* From article by Maurice de Keghel in *La Revue des Produits Chimiques*, July 31, 1923.

Typical Mixings for Bright Distempers.

The type formula given above may serve as a general formula for all those paints in which precipitated calcium carbonate is utilised as the filling or shading material, but whilst the respective contents of casein and hydrated lime may remain invariable, the amount of filling material will alter with the quantity of pigment added. For a blue water paint we have, for example, the following typical formula:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	90 kilos.
Bremen Blue	30 kilos.

One of the characteristics of casein colours is the purity of the tones that can be obtained. The finest distempers in pale and at the same time vivid reds, blues, greens, greys and violets are made with mixtures containing little colouring matter and much filling material. The following formulas may serve as bases for making very pretty tones:

For a *Rose-red*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	113 kilos.
Burnt Sienna	2 kilos.
Vermilion	5 kilos.

For a *Green*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	90 kilos.
Permanent Green	30 kilos.

For an *Olive*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	75 kilos.
Yellow Ochre	36 kilos.
Lamp Black (surfine)	9 kilos.

For a *Lilac*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	83 kilos.
Red Ochre	15 kilos.
Ultramarine Blue	22 kilos.

For a *Grey*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	90 kilos.
Ultramarine Blue	3 kilos.
Frankfort Black	27 kilos.

For a *Yellow*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	100 kilos.
Naples Yellow	17 kilos.
Yellow Ochre	3 kilos.

For a *Brown*:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	83 kilos.
Cassel Brown	15 kilos.
Brown Ochre	12 kilos.
Umber	2 kilos.

Casein colours are often employed for the preparation of paints for facades and also for the interior decoration of houses, workshops and hospitals, on foundations of wood, brick or cement. Imitation of stone or brick work is often desired. A typical formula for a paint possessing a brick colour is the following:

Soluble Casein	15 kilos.
Hydrated Lime	15 kilos.
Sodium Borate	0.15 kilos.
Precipitated Chalk	110.25 kilos.
Cassel Brown	2.25 kilos.
Red Ochre	4.5 kilos.
Chrome Yellow	3 kilos.

(To be continued.)

EGYPTIAN INDUSTRY AND TRADE.

CHEMICALS AND ALLIED PRODUCTS IN 1922.

IN a report on the trade and industry of Egypt up to April, 1923, Mr. E. H. Mulock, the British Commercial Agent for Egypt, states that the year 1922, as compared with its three post-armistice predecessors, has been mediocre and unsatisfying in spite of indications to the contrary, such as a favourable trade balance, large exports of cotton, and a considerable budget surplus on March 31, 1923, the end of the financial year 1922-23. While it is true that the decrease in imports from the United Kingdom is not large, relatively speaking, it is serious, says the report, in view of the fact that it constitutes a further downward step in the steady decline in the percentages of the British Empire in the total imports into Egypt that has been a feature of the years 1919 to 1922 inclusive.

Imports and Consumption of Cement.

Egypt's total annual consumption of cement for the years 1919-1922 is estimated at 33,000; 66,000; 89,000 and 113,000 metric tons respectively. For 1923, however, the total consumption is estimated at 150,000, of which 100,000 will have to be imported. Of the 63,000 tons imported in 1922 the bulk—viz., 38,000, came from Dalmatia, whose success as compared with British and Belgian imports is purely a matter of price, the c.i.f. Alexandria quotation being P.T. 220 for Dalmatian, as against 240 for Belgian and 280 to 290 for British. To these prices must be added about P.T. 40 for clearance charges in order to compare them with the lower manufacturer's quotations, which are, for delivery at Alexandria, lower than those of any imported cement. As regards foreign cement, it should be noted that, although Dalmatian imports have increased from 23,000 metric tons in 1921 to 38,000 in 1922, Belgian imports have risen from 5,360 to 11,440, whereas British cement has only increased from 6,300 to 7,200 tons, and it is understood that Dalmatian imports will tend to decrease, but Belgian to increase still further in view of its superior quality over Dalmatian, and its price being lower than British. It is important to note in this connection that importers prefer British cement to all others because of its superior quality, and would buy it instead of Belgian if the difference in price between the two were only 2s. a ton instead of 8s. to 10s. as at present. In view of Egypt's increasing demand for cement in 1923, and possibly in subsequent years, owing to the house shortage and building activity so much in evidence in Cairo and Alexandria, it would seem to be worth the while of British manufacturers (whose cement is largely dependent for its sale in Egypt on the insistence by certain public authorities on the use of British "Portland") to study the possibilities of making the necessary reduction in their prices with the object of capturing the entire foreign supply of cement for private consumption, which will probably otherwise eventually become a virtual monopoly for Belgium.

General Local Industries.

The forms of industry arising out of and necessitated by the handling and treatment of cotton for marketing it are too obvious in a country like Egypt to need any reference, but cognate industries such as cottonseed crushing for edible oil and cattle-cake, and soap-making with the use of cottonseed oil mixed with locally produced or imported caustic soda are worthy of mention in connection with cotton. Soap is also manufactured locally from caustic soda and edible oils, or sulphuric oil, tallow, etc.

Phosphates, from the Red Sea Coast and Upper Egypt are mined chiefly for export to the United Kingdom, Europe and Japan, and they are also used in a pulverised state mixed with farm-yard manure—but only to a small extent—locally. Owing to the absence of the raw material necessary for the production of sulphuric acid, the cost of converting Egyptian phosphates into superphosphates in the country is so prohibitive that schemes for the erection of works and creation of this industry have had to be abandoned, as competition with imported superphosphates would be out of the question. Only 60,220 metric tons of phosphate were produced in 1922 as against 122,024 in 1921, and 114,813 in 1920. This considerable diminution in output was due to poor demand and offers of prices in some cases below the cost of production, with the result that the mines remained partially shut down. The exports in 1921 were 84,390 metric tons, of a value of £E.185,598, and in 1922 were 18,084 metric tons, of a value of £E.41,806.

The manufacture of paints, etc., from mineral colouring materials available in the neighbourhood of Aswan, is a recently established industry due to purely Egyptian enterprise and initiative. The factory erected at Helouan has now been completely equipped, and the promoters hope to increase their production, which amounted to only 430m. tons in 1921 and 350 in 1922. The optimism as regards output has not been justified up to the present. One important industrial concern, which is due to Italian enterprise, exploits the refractory and other kinds of clay, limestone, etc., available in the country for the manufacture on a large scale of all kinds of earthenware, ceramics and pottery, laboratory appliances, hydraulic lime and cement, plaster, etc. Staffordshire pottery is also produced at this factory, under English supervision, of so good a quality that the head of this concern contemplates holding exhibitions in Cairo and London.

Manganiferous iron ore is mined in Sinai, and is exported chiefly to Belgium, Holland and the United Kingdom. Nitrate shale in Upper Egypt is used locally in its natural state as a fertiliser. Crude carbonate and sulphate of soda is recovered from salt lakes in the Delta and from the large soda lakes at Wadi Natroon where caustic soda is manufactured. The salines near Alexandria and Port Said are also exploited for the production of sufficient salt for local consumption and for large exports to the East. Crude sulphate of magnesia is to be found in Kharga Oasis. The limestone and clay found at Massara, near Cairo, are converted into "Portland" cement by a factory on the spot. This belongs to a Belgian company, whose annual production is 50,000 tons, all of which is absorbed by the local market owing to successful competition in prices, rather than quality, with the imported article. Gypsum is found near Suez and Cairo, and is used both for the manufacture of plaster, and as a fertiliser in finely ground powder form.

THE OXIDATION OF CARBON.

USE OF SILVER BICHROMATE.

THE well-known method of oxidation of organic substances by a mixture of chromic and sulphuric acids has been recently re-examined by J. L. Simon, and the results, some of which were unexpected, have been communicated in a series of notes to the *Comptes rendus* of the Paris Academy of Sciences. With the usual mixture of potassium bichromate and sulphuric acid some compounds are completely, others only partially, oxidised. The substitution of silver bichromate for potassium bichromate in the mixture was found to give complete combustion in some cases where the classical mixture gave only partial oxidation.

The Structure of Graphite.

Interesting and unexpected results were obtained on applying these two mixtures to the oxidation of the various forms of carbon. Pure graphite, using the silver oxidising mixture, was completely oxidised to carbon dioxide (with a trace of carbon monoxide) in half an hour at 100° C.: in the absence of silver the combustion was partial, from 66 per cent. to 72 per cent. being burnt. In a later communication (July 23) it is shown that the deficit in the absence of silver is related to the constitution of the compound, and the aromatic compounds can be clearly distinguished from others by the different figures given by the two reagents.

As regards the different forms of carbon: in the presence of silver, graphite is completely burnt, diamond is not oxidised at all, while for various forms of charcoal, coke, and coal, only from 1 per cent. to 6 per cent. is burnt. The fact that it is possible to oxidise graphite by thirds is in agreement with the view of a hexagonal distribution of the carbon atoms, and there is a marked experimental difference between graphite and certain varieties of black carbon which it is natural to attribute to a difference in constitution.—*Nature.*

MERCURY OUTPUT IN SPAIN.—The production and sale of mercury from the Almaden Mines, which are under Government control, continue to show an increase over 1922, and sales are greatly in excess of production. During May the output was 21,800 flasks, while sales reached about 35,000 flasks, valued at approximately 9,000,000 pesetas. Only 20,619 flasks were sold during the whole of 1922. Stocks on hand at the middle of June were 17,300 flasks.

ITEMS OF INTEREST.

Another Tin-plate Merger.—The Wern Tin-plate Works, Briton Ferry, which comprise four mills, has been acquired by the Briton Ferry Works, Ltd., of which Baldwins, Ltd. are the proprietors.

Industrial Development in Widnes.—By invitation of Sir Max Muspratt and the directors of the United Alkali Company, members of the Widnes Chamber of Commerce visited the company's Pilkington and Sullivan works on Wednesday of last week.

Reparation Dyestuffs.—The British Chemical and Dyestuff Traders' Association has forwarded to its members a list of dyestuffs received recently from Germany as reparations, together with the current selling prices. This is the first list under the new arrangement whereby the Association is supplied with such lists by the Board of Trade.

Erratum.—In the report of the official referee's decision in the formaldehyde appeal case under Part I. of the Safeguarding of Industries Act (the *Chemical Trade Journal and Chemical Engineer*, August 24, 1923), the line in the last paragraph on page 217 reading "heavy in Harris, Hart and Co.'s advertisements," should read "heavy in Heyworth, Hart and Co.'s advertisements."

Tariff Notes.—The duties on the export of guano and calcined bones from Madagascar have been fixed at 10 per cent. by a French decree dated July 31. An export duty of 3 per cent. is placed on animal wax, vanilla, common graphite, oil seeds, volatile or essential oils, vegetable wax, gums, and resins. Standardised graphite is subject to an export duty of 1½ per cent.

State Factory Explosion.—It was explained on Wednesday by Major McKenna, of the Magazines and Safety Services Department of the Disposals Board, at the inquest held at Banbury on Maurice Parkhoe, that an explosion, which killed Parkhoe, must have arisen from a detonation in the ammonal used for extricating aluminium at the Banbury Breaking Down Factory. A verdict of "accidental death" was returned.

Norwegian Production of Ferrovanadium.—Stavanger Tinfabrik A/S, Stavanger, intends to commence production of ferrovanadium towards the end of the present year. Arrangements have been entered into with a Philadelphia firm, one of whose engineers will be attached to the new works, and supplies of a certain raw material have been secured from Colorado. The Stavanger company has obtained the sales rights for Europe.

Chemical Workers' Strike.—The executive members of the Chemical Workers' Union having failed to reach a settlement with the employers, operatives of the Linenleaf Chemical Works, Falkirk, to the number of about 120, came out of strike on Monday. Following a recent stoppage of work in consequence of a reduction of 2s. 6d. per week for shift men, and 2s. for labourers, the men agreed to resume at the reduced rate while the executive negotiated for them.

Institute of Metals.—The official programme of the autumn meeting to be held in Manchester from September 10-13 next has now been issued. On Monday, September 10, Sir Henry Fowler will lecture on "The use of non-ferrous metals in engineering." This lecture will be given in the Milton Hall, Deansgate, at 8 p.m., and not in the College of Technology as stated in the programme. Papers will be presented and discussed on the mornings of Tuesday and Wednesday. Visits to works, and various social events, have also been arranged.

University Department of Chemical Engineering.—The work of the Ramsay Memorial Department of Chemical Engineering at University College, London, will begin in October. This department has been instituted with the object of enabling young graduates in chemistry and engineering, who have already obtained a good training in the fundamental sciences of chemistry, physics, and mathematics, to direct their studies and investigations towards the application of the principles of physical chemistry to the scientific design and operation of the apparatus and processes of chemical industry in general. Mr. E. C. Williams, M.Sc., of the University of Manchester, has been appointed Professor in charge of the department. The University College Committee will shortly appoint an Assistant Lecturer in the department.

Business Notice.—Mr. S. N. Brown, F.C.S., consulting chemist of the Broughton Analytical Laboratories, 7, Chapel Walks, Manchester, has recently formed a partnership with Mr. James Booth, A.M.I.Chem.E., F.C.S., who will act as consulting chemical engineer to the above laboratories.

Whitehaven Coal Dispute Ended.—The longest dispute in the history of the Whitehaven collieries was brought to an end on Friday of last week at a mass meeting of the miners, who decided to accept the colliery company's offer to submit the questions in dispute to arbitration. The dispute has lasted nearly fifteen weeks.

Trade with Cuba.—The British Consul at Santiago de Cuba, Mr. E. V. B. Brice, who is now on a visit to the United Kingdom, will be pleased to interview firms interested in trade with Cuba at the Department of Overseas Trade, until September 8, inclusive. Interviews will be given only by appointment, and applications should be addressed to 35, Old Queen Street, S.W. 1, reference 8622/F.L. being quoted.

Obituary.—We regret to announce the death of Mrs. Hertha Ayrton, on Sunday last, at North Lancing, Sussex. Her name is connected with researches on the electric arc. She was awarded the Hughes Medal of the Royal Society and was the only woman member of the Institute of Electrical Engineers. During the war she invented the "Ayrton Fan," used for dispersing accumulations of poison gas in trenches.

British Peppermint Oil.—An attempt is being made to revive the peppermint-growing industry in Surrey, and White, Tomkins and Courage, Ltd., have acquired land in the neighbourhood of Reigate which has been laid out as a peppermint farm, to which is attached a distillery for the extraction of the oil. The tests already applied to the distilled oil have been so satisfactory that more land will be put into cultivation next year.

Canadian Copper Resources.—It is stated that negotiations are under way at the present time toward obtaining the control and purchase of Manitoba's recently discovered copper belt. Two representatives of the Russo-Asiatic Consolidated, Limited, were in Winnipeg for several days negotiating with holders of the largest groups of claims in the district, when they left for the new mining district to investigate more thoroughly its resources and possibilities.

The Sir John Cass Technical Institute.—The session 1923-24 will commence on Thursday, September 20. Students will be enrolled on Monday, Tuesday, and Wednesday, September 17, 18, and 19, from 6 to 8.30 p.m. The courses of instruction at the Institute, which are held from 6 to 10 p.m., meet the requirements of those engaged in chemical, metallurgical, electrical, petroleum, and the fermentation industries. Full facilities are provided in the well-equipped laboratories of the Institute for special investigations and research. The instruction in experimental science also provides systematic courses for the examinations of the London University, the City and Guilds of London Institute, and of the Institutes of Physics, Chemistry, and Brewing.

Modern Millgearing.—We have received from David Bridge and Co., Ltd., of Castleton, a comprehensive treatise on modern millgearing in the form of an attractively-produced catalogue. The work contains 132 pages and includes many illustrations, diagrams and working formulæ. The text is clearly printed on art paper and prices for all classes of millgearing are quoted. The 52-page appendix covers the whole field of power transmission and is of especial value to engineers, draughtsmen, etc., who want a pocket-size authority on this subject. Among the points dealt with are: Shafting, Keys and Keyways, Couplings, Rope Driving, Belt Driving, Gearing, Chain Driving, Speed Change Gears, etc. A copy will be sent free on request.

The Formaldehyde Decision.—The British Chemical and Dyestuff Traders' Association have complained to the Customs authorities that although the referee's award in the Formaldehyde Appeal Case was dated August 10, and the Board of Trade's notice dated and published on the 13th inst., the alteration in the List of scheduled articles did not take effect until the 20th inst. Certain importers appear to have had consignments of this product arrive in this country between the date of the referee's award and that on which the duty was taken off, and have thus been made to pay the duty. The matter is being taken up by the Association on the ground that the alteration in the list of dutiable articles should have corresponded with the date on which the referee's award was signed.

Change of Address.—The Continuous Reaction Co., Ltd., a constituent company of Nobel Industries, Limited, who, until recently, had offices at 155, Church Road, Battersea, S.W. 11., have now removed these offices to Newton Works, Hyde, Cheshire, to which all correspondence should be sent. —James C. Barr, Limited, announce that they have removed to more central and commodious offices at 67, Great Clyde Street, Glasgow. Telephone Nos., 2965 and 2966 Central.

Swedish Copper Anniversary. — The Store Kopparbergslaga Company, probably the oldest definitely established industrial concern in the world, has been celebrating its 700th anniversary in Sweden. The company was founded during the first half of the 13th century, and the first deliveries of copper from the mine at Falun were made in the year 1225. Since that time the company has continued, with almost unbroken regularity, to play an important part in the economic life of Sweden.

Chinese Groundnut Crop.—Climatic conditions were favourable to groundnuts, and a crop of 20 per cent. above the average in Shantung and North Kiangsu in 1922 was reported. Of the total export of 1,335,400 piculs of groundnut kernals, which is less by 66,400 piculs than in 1921, 663,800 piculs were sent to Chinese ports. The shipment in bulk of groundnut oil is growing in importance, 113,000 and 12,750 piculs having been so sent to the United Kingdom and America respectively during the year.

Carbide Manufacture in Sao Paulo.—The use of calcium carbide is gradually decreasing in the State of Sao Paulo, Brazil, states an American Consular Report. Formerly, foreign manufacturers supplied this field to a considerable extent, but imported calcium carbide has been driven from the market because of its inability to compete in price with the native product, especially that manufactured at Palmyra, Minas Geraes. The present exchange situation, together with a high import duty, has resulted in giving Brazilian carbide practically a monopoly of the market.

Detection of Nickel in Solution.—C. G. Vernon (*Chem. News*, 1923, 126, 200) has found that on passing hydrogen sulphide through a nickel solution to which concentrated ammonia solution has been added, and boiling, nickel is deposited in the form of a bright mirror with darkening of the solution, or, in quite dilute solutions, as an iridescent film. The presence of cobalt does not interfere, and the test may be introduced into an ordinary qualitative analysis by adding excess of strong ammonia solution before precipitating the metals of the nickel group with hydrogen sulphide. —*The Analyst*.

Estimation of Alcohol in Benzol.—The removal of alcohol from benzene by washing it with pure water is difficult, since emulsions are formed which separate with difficulty even if a centrifuge is used. According to P. Schwarze (*Chem. Zeit.*, 1923, 47, 462), however, such emulsions are not formed if the benzene is previously mixed with spindle oil. Hence the estimation of alcohol in benzol is rapidly carried out by mixing the benzol with about its own weight of spindle oil, extracting the mixture 3–4 times with a 5–10 per cent. solution of salt, distilling the aqueous extract, and determining the alcohol in the distillate by the usual method.—*J.S.C.I.*

The Diazotisation of Para-Nitraniline.—The preparation of a solution of diazotised *p*-nitraniline is satisfactorily carried out, according to a *J.S.C.I.* abstract of a paper by C. and H. Sunder (*Bull. Soc. Ind. Mulhouse*, 1923, 89, 237), by quickly adding dilute hydrochloric acid (an excess not greater than 0.1mol. is used) to a solution containing sodium nitrite and *p*-nitraniline at 10°–14° C. Although, for the production of a good Para-red shade, it is usually necessary to convert all the diazotised *p*-nitraniline into the corresponding diazonium acetate, this may be partly avoided if diazotisation is effected in the presence of an excess of hydrochloric acid not exceeding 0.1mol. For instance, satisfactory dyeing is obtained by means of a solution containing diazotised *p*-nitraniline, 85.9 per cent. as the diazonium chloride and 14.1 per cent. as the diazonium acetate. A satisfactory printing paste (the excess of sodium acetate contained therein could probably be reduced) is prepared by the addition of 6,515g. of hydrochloric acid of 20° B. (sp. gr. 1.16) and 21 l. of gum tragacanth thickening, to 2,800g. of *p*-nitraniline and 1,540g. of sodium nitrite dissolved in 2 l. of cold water (temperature not higher than 10° C.), and afterwards adding 6,300g. of sodium acetate crystals dissolved in 15.5 l. of cold water, the mixture being then diluted with water to 100 l.

Modern Electrical Pyrometry.—In the article in this subject by Mr. David Brownlie in our issue of last week, the illustration in page 215 of a switch panel recording electrical pyrometer, made by Negretti and Zambra, Ltd., is not of the plug-in type of instrument, as might have been inferred from the context, but of the switch type. The makers claim that this type has a distinct advantage over the plug-in system, inasmuch as there is no danger of leaving in the plug, and so inadvertently wasting current.

British Coal Output.—During the quarter ended March 31 last the amount of saleable coal raised in Great Britain was 67,077,543 tons, and the quantity disposable commercially was 61,335,892 tons, of which 23,262,722 tons were shipped. The net costs were £50,663,203., or 16s. 6.24d. per ton disposable commercially, of which wages formed £35,441,768., or 11s. 6.68d. per ton. The total number of workpeople employed was 1,087,733, the average output per man-shift worked being 18.25cwt., and the average earnings per man-shift worked 9s. 7.72d.

CHEMICAL TRADE OF THE NETHERLANDS.

JULY IMPORTS AND EXPORTS.

THE following statistics, which have been furnished by the Bureau voor Buitenlandsche Bedrijfsberichten, of The Hague, show the imports into and exports of chemical products from Holland during the month of July, 1923.

Imports of Chemical Products.

		Kilogrammes.	Florins.
Calcium acetate	Total	393,000	83,000
	Belgium	89,000	17,000
	U.S.A.	304,000	66,000
Lead acetate	Total	11,000	5,000
Acetone	Total	23,000	19,000
Methyl alcohol	Total	32,000	20,000
Soda ash	Total	1,761,000	132,000
	Belgium	244,000	19,000
	United K'dom	300,000	22,000
	France	500,000	46,000
	B.E. Africa	512,000	32,000
Soda crystals	Total	71,000	4,000
Caustic soda	Total	590,000	112,000
	United K'dom	100,000	19,000
	France	137,000	25,000
	U.S.A.	253,000	50,000
Bleaching powder	Total	371,000	35,000
	Germany	19,000	1,000
	Belgium	167,000	15,000
	United K'dom.	72,000	8,000
	Italy	113,000	10,000
Calcium carbide	Total	381,000	46,000
	Germany	1,000	—
	Sweden	74,000	9,000
	Switzerland	303,000	36,000
Magnesia	Total	1,692,000	91,000
	Greece	1,682,000	91,000
Alum	Total	21,000	2,000
Boric acid	Total	85,000	26,000
	United K'dom.	83,000	26,000
Iron sulphate	Total	42,000	1,000
Copper sulphate	Total	23,000	6,000
Sodium sulphate	Total	469,000	23,000
Sulphuric acid	Total	9,886,000	183,000
	Belgium	9,854,000	180,000
Hydrochloric acid	Total	515,000	11,000
Liquid carbonic acid	Total	76,000	27,000
Salammoniac	Total	19,000	5,000

Exports of Chemical Products.

Lead acetate	Total	36,000	16,000
Soda ash	Total	11,000	1,000
Caustic soda	Total	35,000	7,000
Calcium carbide	Total	36,000	5,000
Magnesia	Total	1,108,000	88,000
	Germany	21,000	2,000
	Belgium	18,000	2,000
	United K'dom.	162,000	13,000

Hydrochloric acid	Total	3,000	—
Liquid carbonic acid	Total	23,000	7,000

CORRESPONDENCE.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

A NOVEL NITROGEN FIXATION PROCESS.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—With reference to the interesting editorial entitled "A Novel Nitrogen Fixation Process," in the issue of *The Chemical Trade Journal and Chemical Engineer* of August 17, I am glad to say that about ten years ago I made some successful attempts by a process identical with the one alluded to in your remarks. It might perhaps interest the American research workers that I found silicate of ammonia containing peroxide of manganese in suspension to be a suitable catalyst for promoting the reaction at ordinary temperature and pressure, which, of course, is increased by the increase of pressure.

In my process, which is covered by patent rights, I also took great care that the reaction should take place in a solution containing sufficient ammonia to keep the solution at all times alkaline, and also to increase the solubility of nitrogen in the mixture. The use of anodes made of ordinary ferro-manganese seemed to increase the yield, and at the same time to lessen the corrosion of the anodes which were originally made of chemical sheet lead. By using ordinary gas liquor I succeeded in producing sulphate of ammonia by combining the sulphur contained in the liquor with the ammonia already present, and also with the hydro-electric ammonia obtained in the process, etc. A French copy of my Belgian patent is enclosed.—Yours, etc.—

17, Boulevard du Nord, Courtrai, Belgium. August 24, 1923. J. J. van der Bossche.

[We have perused carefully the patent specification to which M. van der Bossche refers in the above letter. The process described therein, whilst of great interest, is not strictly comparable to the hydrolytic method for the decomposition of nitrogen in solution referred to in the editorial in our issue of August 17. The method proposed by M. van der Bossche is an electrolytic one, and consists essentially in forcing nitrogen under pressure into a solution such as gas liquor, whilst the solution is being electrolysed between electrodes of ferro-manganese. In the presence of the catalysts, such as the silicate of ammonia and the manganese dioxide referred to in the letter, the hydrogen liberated at the cathode combines with the ntirogen in the solution. The complete specification is very detailed and we shall give a translation of it in an early issue. Meanwhile, although the two methods under consideration are not exactly comparable, the catalysts found most efficient by M. van der Bossche might be tested profitably in the nitrogen-hydrolysis method.—Ed., *C.T.J. and C.E.*]

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

British West Indies.

A firm of builders, auctioneers and furniture dealers in Trinidad, who hold purchasing agencies for hardware, sanitary ware, and concrete reinforcing materials, desire to secure the representation of British manufacturers of paint, varnish, and oil on a purchasing basis. (Ref. 216.)

Belgium.

A Belgian agent in Brussels desires to secure the representation, on a commission basis or otherwise, of British manufacturers of shellac, manilla gum, fish glues, and chemical products. (Ref. No. 220.)

Italy.

A British firm of anti-friction metal makers wish to secure additional lines, especially metals and other alloys, including phosphor bronze, for their Italian agent, who is well established and will deal direct. (Ref. No. 222.)

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Anchor China Clay Syndicate, Ltd., London, E.C.—Registered August 7, Trust Deed dated July 18, 1923, securing £3,000. deb. stock.

Brooksbank (E.) and Co., Ltd., Manchester, soap manufacturers and oil refiners.—Registered July 30, mortgage, to National Provincial and Union Bank of England, Ltd., securing all moneys due or to become due to the Bank.

Lamplough (F.) and Co., Ltd., London, S.W., oil and manufacturing chemists.—Registered July 27, Trust Deed dated July 10, 1923, securing £20,000. debs. and bonus of 30 per cent. on redemption.

Leeds Flint Glass Company, Ltd.—Registered August 10, £2,000. 2nd debs. (filed under sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £700.

Snelling and Sons, Ltd., Norwich, tallow refiners.—Registered August 7, £8,000. debs., part of £33,000.

Taylors' Drug Company, Ltd., Leeds.—Registered August 7, £1,000. mortgage, to Emily Wight and another, Combermere, The Drive, Roundhay.

Tomlinson and Co., Ltd., Stairfoot, flint glass manufacturers.—Registered July 30, £4,000. deb., to Branch Nominees, Ltd., 15, Bishopsgate, London, E.C.

Tunnel Portland Cement Company, Ltd., West Thurrock.—Registered August 8, deb., to Barclay's Bank, Ltd., securing all moneys due or to become due to the Bank.

Welsh Drug Houses, Ltd., Mountain Ash.—Registered August 10, mortgage, to London Joint City and Midland Bank, Ltd., securing all moneys due or to become due to the Bank.

Irish Disinfectants, Ltd., Dublin.—Registered August 9 (by order of court), charge, to Munster and Leinster Bank, Ltd., securing all moneys due or to become due to the Bank.

SATISFACTIONS.

Pearson (E. T.) and Co., Ltd., London, W.C., manufacturing chemists.—Satisfaction registered August 13, £2,250., registered October 13, 1919.

South African Carbide and By-Products Company, Ltd., London, E.C.—Satisfaction registered August 14, £360., part of amount registered April 8, 1922.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Veeta Chemical Company, Ltd.—Resolved August 8, that the company be voluntarily wound up. G. R. Lawson, 20, Exchange Buildings, Bradford, liquidator.

Water Softeners, Ltd.—Resolved July 17, confirmed August 2, that the company be voluntarily wound up, having regard to the agreement dated May 15, 1923, entered into by this company for the sale of the goodwill and assets to United Water Softeners, Ltd. W. G. Luton, 93, Queen Victoria Street, London, E.C., liquidator.

Woodcroft Manufacturing Company, Ltd., Liverpool, manufacturing chemists.—J. C. Oldfield ceased to act as receiver July 23 (under 1st deb. only, dated August 17, 1922).

BANKRUPTCY INFORMATION.

Burlin, Adolph Lionel, 297, Seven Sisters Road, Finsbury Park, consulting chemist. Adj. August 17.

Curtis, Wm. Hy., Atlas Chemical Works Cottage, and trading at Atlas Chemical Works, New Mills, as W. H. Curtis and Co., manufacturing chemists. 1st meeting, O.R.'s, Manchester, August 30. Exam., C.C., Stockport, Sept. 25.

Hirchberg, Leon M., 20, Birchington Road, Stroud Green, and Ely Place, London, E.C., consulting chemist. 1st and final dividend, 1s. 6d., at 28, Kimberley House, Holborn Viaduct, London, E.C., August 13.

DISSOLUTIONS OF PARTNERSHIP.

(*Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.*)

Auto By-Products Company (Frank Stringer, Arthur Roscoe, and Thos. Jas. Sumner), 41, North John Street, Liverpool, motor accessory and chemical manufacturers. August 9. Debts by F. Stringer and A. Roscoe, who continue. (August 14.)

Rhodes, D., and Co. (Kenneth Saul and Ralph Frdk. Holdsworth), Beck Street, Bradford, grease refiners. August 1. Debts by K. Saul, who continues. (August 14.)

REPORTS OF COMPANIES.

Goodlass, Wall, and Co., Ltd.

The annual general meeting was held on Thursday, of last week, at Liverpool. Mr. John Byrne, who presided, said he attributed the splendid results obtained, amongst other things, to the fact that the company were manufacturing paints, colours, and varnishes of a very high quality, which were greatly appreciated in all the principal markets. They had obtained only a slight relief from taxation, and had not yet benefited from the reduction in corporation profits tax. Additional new modern buildings were in course of erection, equipped with the most up-to-date plant, which would greatly increase the output, and give further facilities for manufacturing the company's specialities. The Cardiff premises had been practically rebuilt, with all modern conveniences, which would assist in the development of the trade in that area. The company's investments had increased to £68,000. He was hopeful that if normal conditions prevailed during the ensuing year that at least equally good results would be obtained. The recommendations embodied in the directors' report, including payment of a dividend of 2s. 6d. per share (12½ per cent.), less tax, on the ordinary shares, were confirmed..

Broken Hill Proprietary Co., Ltd.

Net loss for the year to May 31, 1923, was £106,086., after allowing for depreciation £155,304., and £131,277. debenture interest. £100,000. was transferred from reserve to appropriation. Accounts presented cover about nine months' idleness and three months' working; also cover costs of starting up, which are necessarily heavy. Unfortunately, it has not been possible to realise full benefit of all improvements before the close of the year, owing to cessation of work at Maitland Collieries, which is now settled. A subsidiary company has been formed to utilise blast-furnace slag and tar for road-making material. The directors decided that it was desirable to have a more direct interest in coal supply, and steps have been taken in this direction; approximately 3,800 acres of good coal-bearing lands in Maitland district have been purchased, and it is expected to commence developments of this property shortly. Slimes dumps from which lead and zinc concentrates have been produced during the last two years will be exhausted about August, but there still remains 60,000 tons of slimes from which zinc concentrates can be obtained profitably. Tailings dumps, which are being retreated by zinc flotation plant, will last about six months. It is anticipated that underground mining operations will be resumed next October. Reserves of ore at mine are estimated at about 954,000 tons.

Minerals Separation, Ltd.

At the annual meeting in London on Tuesday last, Mr. F. L. Gibbs, presiding, said that there was now little doubt that the department of their business which would prove to be the first to become income-bearing on a considerable scale would be that which dealt with the cleaning of coal and the briquetting of coal. The first fruits of the process would be in the shape of plants treating from 500 to 1,000 tons a day, until in 1925 he anticipated that the company's processes for briquetting coal would be producing over 10,000 tons every day, and possibly very much more than that figure.

Referring to the ore reduction process for the treatment of oxidised silicate and carbonate copper ores in which they were largely interested, the Chairman said they had made a decided advance, and they were making great advances in Northern Rhodesia. The reputation already created for their new coal processes could not fail to be of immense benefit to the coal mining industry, and he hoped later on in the year to be able to give information that a similar reputation had been established for their new metals processes, with special application to the world's copper industry.

The report was unanimously adopted.

DIVIDENDS.

Dominion Tar and Chemical Co., Ltd.—The directors have declared a final dividend of 2½ per cent., free of tax, making 5 per cent. for half-year ended June 30.

Standard Chemical Company.—Net profits for the year ended March 31 were 42,626dol., reducing the debit balance brought forward to 581,462dol.

Staveley Coal and Iron Co., Ltd.—Final dividend of 1s. per fully-paid share, 9d. per share on each share with 15s. paid, and 3d. per share on shares with 5s. paid, making 7½ p.c. for the year ended June 30 last. It is also proposed to pay a diamond jubilee bonus of 2½ per cent. on the paid-up capital of the company. For the preceding 12 months the shareholders received a dividend of 7½ per cent., to which figure it was reduced from 10 per cent. paid for 1920-21.

British Broken Hill Proprietary Co., Ltd.—The liquidator announces that he intends on September 10 to declare a first and final dividend of 35s. per share, payable on and after September 24 next to all shareholders now on the register.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

It is a curious thing, and one seldom noted in Cumberland, that while the coal trade is growing slacker the coke trade is becoming brisker. Of course, conditions are not normal. The Whitehaven ovens are still out of operation, and the production, therefore, is considerably below that which in an ordinary way is forthcoming. So that when the Whitehaven coking plant resumes operations—as it shortly will, the dispute having at last been referred to arbitration—it is quite likely that there may be rather more coke available than can be marketed. Still, it is rather remarkable that coke should be in so much brisker request than coal, and it cannot be said that Cumberland coke is in less keen competition with other makes than the coal is with the product of other coalfields. It has to be remarked that the hematite pig-iron trade is characterised by a firmer tone than has been the case for some time past. True it is, at all events, that stocks in works' yards are now being reduced, and that at the present rate of progress, provided the make of the twelve furnaces in blast continues to go into consumption, they may be exhausted by mid-autumn. It would appear as though there may now be some prospect of a revival of the iron trade towards October, and if this should prove to be the case it goes without saying that the coking and coal industries would immediately benefit. All the small coal, as it is, has to be reserved for the coking plants, and neither Irish nor local needs can be satisfied. Workington and Furness smelters are taking the greater part of the make of coke at 29s. to 33s. per ton, according to carbon content, and the Continent about 1,500 to 1,700 tons per week at 34s. to 37s., f.o.b. East Coast coke supplies for the furnaces on special qualities of iron are 8,200 tons per week. Residuals are active. The chemical works are accepting the whole of the tar, and sulphate of ammonia and crude benzol are in fairly good request.

FERTILISER NEWS.

Nitrate of Soda.—The fertiliser trade in this country remains very quiet, and the home demand in all classes is slow. Harvesting operations, which are very much interfered with by the unsettled weather, are proceeding in most districts, and until these are over, farmers will scarcely turn their attention to forecasting their fertiliser requirements on next season's account. Until this is done, however, merchants are unable to estimate the quantities they are likely to want, so that interest is very small apart from the needs of makers of compound manures and proprietary mixtures. Business in nitrate is almost at a standstill, not only here, but in America. In that country, the market is very dull, buyers considering the present scale of prices too high. The only recent purchase of any importance was by a group of consumers, who bought through a committee, thus securing some small concessions in the matter of price. Conditions have been so quiet of late, however, that even for small lots, the official prices have been shaded almost to the level at which business was done by the group committee. It is felt that the Chilean producers could reduce prices and still operate at a profit, and the widespread nature of this belief is mainly responsible for the lack of interest in the material. Sales by the producers are disappointingly small, but the low price of competitive nitrogenous fertilisers is no small factor in the situation. The Chilean Government, alarmed at the continued indifference of buyers, proposes to allow exporters to place their stocks of nitrate abroad without immediate payment of the export tax. To encourage consumption, therefore, payment of the tax will be postponed, it is reported, on exports up to the quantity of about 300,000 tons. Official statistics show the amount owing to the Chilean Government by the nitrate industry to be over 30,000,000 dollars at the end of July. It may be inferred from this that if the Government are willing to add considerably to this amount, the industry must be in a very needy state, despite the recent optimistic announcements on the subject.

Sulphate of Ammonia.—In the market for this product, there is very little change, and the demand on home account remains on the quiet side. Inquiry for export continues to be satisfactory, however, and with the cessation of the dock strike, shipments of arrears are steadily proceeding. Japan continues to take considerable quantities, and the official returns for the current month should place that purchaser high up in the list of importing countries. From France comes the interesting announcement of the proposed formation of an association known as the "Groupe de defense des acheteurs de sulphate d' ammoniaque anglais," which might be freely translated as the "French Buyers of British Sulphate Mutual Protection Society." It is understood that the reasons for the action of certain French importers in thus organising themselves are in the first place that verbal promises are said to have been given by English exporters and merchants, that prices should be fixed at certain stated levels, whereas it is claimed that contracts made out at agreed prices have been followed by further offers at lower quotations. Secondly, the organisers say that the difficult situation resulting from the prohibition of the export of sulphate of ammonia from France is another reason for uniting; while thirdly, it is the professed intention of the "groupe" to entirely boycott those British sellers who do not subscribe to the doctrine that, having bought British sulphate on contract prices, the French sellers should be free to compete with the British sellers in other markets where the rate of exchange allows them to do so. Our contemporary, *L'Engrais*, does not think that such a project will meet with success. Commenting on the facts given above, the paper states that when buyers and sellers have mutually agreed upon quantities and prices in a contract to which they have added their signatures, that contract should stand, otherwise, commercial honesty is at a discount, with disastrous results. What happens outside that agreement does not, and should not, affect its provisions. The weakness in the first reason, therefore, is that verbal promises in the matter of price stabilisation are of no legal value, while market fluctuations frequently mean changed circumstances in which such verbal assurances become useless. The whole incident seems to savour of the disappointment of a number of merchant speculators who made heavy purchases at last season's higher prices, and are now unable to dispose of their stocks except at a loss. As our contemporary justly remarks, however, "when an error of judgment has been made, the least that one can do is to "play the game," and to accept the risks involved in such transactions."

SOUTH WALES NOTES.

[Specially Contributed.]

There is a more cheerful tone in the tinplate industry, the demand is showing signs of a slight but steady improvement. Requirements for the Far Eastern markets have expanded. A marked improvement is to be noticed in the galvanising trades, especially in corrugated sheets for which a fair demand has arisen and prices are firmer. Supplies of spelter for immediate delivery have become rather restricted, and a further advance in values is expected. With the slight relaxation in patent-fuel prices, business has become more lively, and there are indications that further reductions may be made. Messrs. Baldwin's Ltd., have acquired the Wern Tinplate Co.'s undertaking at Briton Ferry on advantageous terms. A new blast furnace is being rapidly completed, and it is expected that in a few weeks' time it will be put into activity. Rumours are heard of further amalgamations both in the tinplate and steel industries in South Wales. There is a quiet market for cokes and prices have dropped to about 50s. for best qualities. The ovens are fully operating owing to the fact that there is a brisk demand for residuals. Nickel makers report improvements in their business, and by-products find a good market.

The imports for the week are 17 tons copper precipitate from Havre to Swansea; 3,486 tons iron ores from Bilbao to Newport; 2,188 tons precipitate of copper from Huelva, 6,830 tons of iron ore from Walana to Port Talbot. Among the exports were 700 tons sulphate of ammonia from Cardiff to Lisbon, and 31 tons painters' colours from Newport to South Africa.

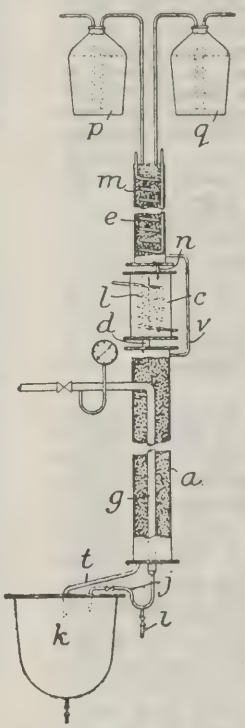
ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Alkali Cyanide Retorts. H. G. C. Fairweather, London. (Air Reduction Company, Inc., New York, U.S.A.) British Patent, **199,900**, of 1922.

Retorts for use in the manufacture of alkali metal cyanides are made with a body portion of nickel-chrome alloy and a thin non-porous lining of iron, steel or other ferrous metal. The lining may be spaced from the body portion by a flange at one end and adjusting screws at the other, so that the two parts can expand independently, and the intervening space is packed with finely divided iron, or a mixture of iron and a reducing-agent such as carbon. Nichrome or alloys containing about 85 per cent. of nickel and 10 to 15 per cent. of chromium, or 50 to 60 per cent. nickel, 10 to 20 per cent. chromium and 10 to 30 per cent. iron may be used for the body portion of the retort. Specification 136,750 is referred to.

Production of Hydrazine. R. A. Joyner and Nobel's Explosives Company, Ltd., Ardeer Factory, Stevenston, Ayrshire. British Patent, **199,750**, of 1921.

In the production of hydrazine by reaction between ammonia and a hypochlorite in presence of a catalyst, a high concentration of ammonia is maintained at the point where the reaction takes place. Apparatus for the execution of the process comprises two tower-sections *a*, *e*, packed with pumice or similar material and divided by the trap *c*. The bottom section *a* is traversed by the iron tube *q* connected to a steam-supply and terminating in a blow-off, *i*, and a connection *j* to the hydrazine-receiver *k*, or alternatively the sections *a*, *e*, may both be heated by the introduction of steam through the lead *t*. The middle section or trap *c* and the upper section *e* are provided with coils *l*, *m* respectively. In operation, the bottom and middle sections are warmed, and ammonia solution of 18 per cent. strength is poured down the top section until the trap *c* is full. When the temperature in the trap has risen to about 40° C. the reacting solutions—*e.g.*, a 1.5 N. ammonia-solution containing 1.5 grs. glue per litre and a 0.8 N. sodium-hypochlorite solution, are fed to the section *e* at constant and equal rates from the vessels *p*, *q*. The mixed solution pass by the pipe *n* into the bottom of the trap *c*, where the reaction is completed, and trickles out therefrom by the pipe *d* to the upper part of the section *a*. Here the excess ammonia is expelled, passing by the pipe *v* to the bottom of the top section, where it is re-dissolved in the reaction-mixture, while hydrazine liquor collects in the receiver *k*. Generally it is necessary to cool the liquor in the trap *c* to maintain the desired temperature of 40-50° C.; the concentration of ammonia in the trap is thus maintained at about 18 per cent. The glue used as catalyst is preferably prepared by boiling two litres of 20 per cent. glue solution containing 65 grm. of hydrochloric acid gas under reflux for one hour, and then adding sodium hydroxide until the mixture is alkaline to phenolphthalein. Specification 139/08 is referred to.



Formaldehyde. L. M. Hirchberg, London. British Patent, **199,759**, of 1922.

Aqueous solutions of formaldehyde which contain only a minimum quantity of methyl alcohol are obtained by subjecting a mixture of formaldehyde, methyl alcohol and water vapours—as it issues from a methyl alcohol oxidation plant or obtained by distilling commercial formaldehyde solutions—to fractional condensation in a rectifying column, the aqueous condensate on the lowermost plates being withdrawn at a temperature in the neighbourhood of 90-95° C. as soon as formed. The absence of methyl alcohol inhibits the production of acetals, such as methylal, which are stated to be conducive to the polymerisation of the formaldehyde.

Formaldehyde. L. M. Hirchberg, London. British Patent, **199,760**, of 1922.

In the catalytic oxidation of methyl alcohol to formaldehyde in the presence of steam, the amount of oxygen-containing gas present relative to the methyl alcohol does not substantially exceed the proportions corresponding with one

molecule of oxygen to two molecules of methyl alcohol. The steam is preferably introduced as dry superheated steam and the proportions by weight of steam relative to methyl alcohol preferably vary from 1:24 to 1:9.

Vegetable Charcoal. L. H. Bonnard, London. British Patent, **199,751,** of 1921.

A vegetable material, preferably of fibrous character, for example sawdust or peat, is comminuted and intimately mixed with slaked lime and heated in a retort to a temperature of about 1,000° C., until carbon monoxide ceases to be evolved, when the temperature is maintained for a further short period. The mixing with lime is preferably facilitated by the presence of a small proportion of water. According to examples equal weights of sawdust and water are mixed with calcium hydroxide in a ball- or edge-runner-mill, and then heated to about 1,000° C. in a retort, preferably that described in Specification 196,958, the period of further heating varying with the amount of lime. After cooling, the lime may be again slaked and the whole submitted to a further heat treatment. Chalk may be used instead of lime, but in this case the second heat treatment is essential. The lime may be removed by any known means. The charcoal is suitable for purifying sugar, or oils, or for sterilising liquids, etc. By-products from the distillation are collected.

Catalytic Oxidation of Organic Compounds. J. Y. Johnson, London. (Badische Anilin and Soda Fabrik, Ludwigshafen-on-Rhine, Germany.) British Patent, **199,886,** of 1922.

The partial oxidation of organic compounds is effected by passing the compound in the gaseous or vapour phase, in admixture with an oxygen-containing gas, over boric or phosphoric acid or their salts. The catalytic materials are preferably mounted on a carrier; thus clay, firebrick or magnesia is soaked with boric or phosphoric acid, or silica, kieselguhr, a metallic oxide, carbonate or nitrate is introduced into molten boric acid. Mixed catalysts, obtained by adding boric or phosphoric acid to molten metal salts such as nitrates, may be used. According to the examples: (1) formaldehyde is produced by passing ethylene and oxygen over boric or phosphoric acid or their salts mounted on burnt clay or diatomaceous earth; the gases may circulate over the contact mass, the formaldehyde being absorbed in water and further ethylene and oxygen being introduced continuously or at intervals; methane, acetone, ethyl alcohol and cyclohexanone may also be oxidised to formaldehyde in a similar way; (2) anthracene and air passed over the catalytic material yield anthraquinone, benzyl alcohol gives benzaldehyde and ethyl alcohol produces acetaldehyde.

Thermo-resistant Glass. C. J. van Nieuwenburg, Delft, Holland. British Patent, **200,020,** of 1922.

In the manufacture of thermo-resistant glass, lithium-alumino-silicate, preferably as lepidolite, is added to the ordinary materials, with the addition of a substance such as zinc oxide or boric acid compounds which promotes the melting process. The glass produced has an increased tensile strength with a resultant increased coefficient of thermal endurance.

Purifying Clay. W. Feldenheimer, London; and W. W. Plowman, East Sheen, Surrey. British Patent, **199,795,** of 1922.

A process for the purification of clay comprises peptisation of the clay in an aqueous solution of caustic alkali, such as caustic soda, which contains the hydrate of an alkaline-earth, such as hydrate of calcium, barium, or strontium, the amount of reagents added for suspending any given clay being varied according to the hardness of the water used. The solution of mixed hydrates may be obtained by the interaction of an excess of caustic alkali and an alkaline-earth hypochlorite such as bleaching-powder in the presence of water. The suspension of clay may be separated from the unpeptised impurities, when such are present, and the clay recovered in any desired manner. A soluble hypochlorite may also be present in the liquid for bleaching, deodorising and sterilising the clay, in which case a longer period of contact is usually necessary, or the hypochlorite may be added to the suspension after the impurities, if any, have been removed.

Inks. W. J. Mellersh-Jackson, London. (Alchemic Gold Company, Inc., Manhattan, New York, U.S.A.) British Patent, **199,923,** of 1922.

Metallic-pigment and other inks for application by heated stamps to bookbindings, labels, etc., are made with a vehicle consisting of a resinous thickening-agent, such as colophony, dammar, copal, Burgundy pitch, Canada balsam, or benzoin, dissolved in a solvent having a boiling-point between the limits 200°—300° C., specified solvents being terpineol and other derivatives of the terpene series, such as terpinyl acetate, benzyl alcohol, aromatic esters such as terpinyl acetate, benzyl acetate and ethyl benzoate, and oil of dammar resin.

NEW COMPANIES.

Banff and Moray Agricultural Company, Ltd.—Private company. Capital £20,000., in £1. shares. Manufacturers of chemicals, acids, fertilisers, etc. Office: Grand Hotel Buildings, Elgin.

Beswick's Lime Works, Ltd.—Private company. Capital £25,000. Limestone quarry proprietors and lime burners, etc. Office: Brierlow, Hindlow, near Buxton.

Commercial Petroleum Company, Ltd.—Private company. Capital £3,500. Dealers in and refiners of petroleum. Solicitors: Francis and Johnson, 62, London Wall, London, E.C. 2.

Geo. Osmond Hutchins Oils, Ltd.—Private company. Capital £1,500. Oil refiners. Address: 6, Trafalger Place, Swansea.

Hightensite and Ebonite Manufacturing Company, Ltd.—Private company. Capital £15,000. Manufacturers of ebonite, etc. Office: 54, Conduit Street, London, W. 1.

Lactobacilline, Ltd.—Private company. Capital £100. Manufacturing chemists, dealers in chemicals, etc. Office: 15, Great St. Andrew Street, London, W.C. 2.

Permanent Bronzing and Restoring Syndicate, Ltd.—Private company. Capital £2,500. Manufacturers and treaters of and dealers in bronze, brass, and similar metals, etc. Office: 146, St. John's Street, London, E.C. 1.

Sopex Company, Ltd.—Private company. Capital £1,000. Manufacturers of soaps, manufacturers and refiners of and dealers in all kinds of oils, etc. Solicitors: Harold Elwell and Co., 65, Coleman Street, London, E.C. 2.

Standard Match Company, Ltd.—Private company. Capital £40,000. Office: Hempstead, Gloucester.

Sublima, Ltd.—Private company. Capital £1,000. Manufacturers of cleansing materials. Office: Stevenage House, 40-44, Holborn Viaduct, E.C. 1.

Tomlinsons (Manchester), Ltd.—Private company. Capital £2,000. Manufacturers and dealers in medical preparations, etc. Office: 21 and 23, Embden Street, Chorlton-upon-Medlock, Manchester.

William Pinchin and Co., Ltd.—Private company. Capital £6,000. Colour, paint, and varnish manufacturers and white lead merchants. Office: 2, Hague Street, London, E. 2.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," September 1, 1888.)

Transport of Liquefied Gases.—Some new regulations which have been published concerning the transport of liquid carbonic-acid and nitrous-oxide gases may be of interest to export agents. It is ordered that the liquids must be filled into wrought-steel or wrought-iron vessels previously tested to a pressure of 250 atmospheres. The taps must be secured by special caps. The cylindrical form is not allowed unless it be designed in such a manner as to counteract the tendency to roll along plane surfaces. Carbonic-acid gas will be also allowed if the pressure does not exceed 20 atmospheres, and it is to be kept in vessels similar to those above described. These latter must have been subjected to a pressure at least one and one-half times as great as that which the contents will exert. Acids are also considered worthy of more attention as regards transport, and now, though they may be still stored in carboys, yet the hay or straw in which the vessel itself is packed must be impregnated with solution of calcic chloride, sodic sulphate or chloride, or ferric chloride, so as to diminish its tendency to ready inflammability. Other directions are given, but these apply only to Continental railway companies.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—A number of important reductions in prices are recorded this week. Business continues slowly, and for small quantities at cut prices. Carbonate and caustic potash are easier. Citric acid is a weak feature. Hyposulphite of soda is cheaper. Prussiate of potash has once more moved in buyers' favour. **Acetic Acid,** 80% technical, £47.; 80% pure, £51.; 98% glacial, £60. in casks, and about £73. in glass demi-johns, ex wharf, London; with spot supplies still rather limited the position keeps very firm. **Acetone,** British Government specification, £125. to £127. per ton, in drums; the state of world supplies certainly tends towards higher prices in the future. **Alum,** lump, in casks, £10. per ton; Continental offers are free and cheap, but there seems to be little demand at present. **Arsenic,** Cornish, white powdered, on spot, about £73. per ton; there is no change as regards spot supplies; slightly easier prices are mentioned for forward delivery. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; there is little interest shown in this item now that the season has ended. **Barium Chloride,** 98/100%, £15. per ton; the demand from dealers keeps very restricted, with prices asked a shade easier. **Bleaching Powder,** 35/37%, £10. per ton; importers are quoting in the region of this figure for shipment, but find business slow. **Borax,** commercial, granulated, £26. 10s.; crystals, £27.; powdered, £28.; extra fine, £29.; B.P. crystals, £31.; powdered, £32.; extra fine, £33.; per ton, for home trade only, in two cwt. bags, carriage paid to destination; British makers' prices are unchanged at these levels; dealers are offering for home consumption under similar conditions to makers at, granulated, £25. 10s.; and powdered, £27. per ton **Borax Glass,** lump, £74.; powdered, £75. per ton, in tin-lined cases; British makers' prices for home trade only, packages free, carriage paid to destination, remain at these figures. **Boric Acid,** commercial, crystals, £50.; powdered, £52.; B.P. crystals, £56; powdered, £60.; extra fine, £62. per ton, in free bags, carriage paid to destination; British makers offering at these unchanged rates for home trade only; dealers are offering at competitive rates. **Cream of Tarter,** 99/100%, about 90s. to 92s. per cwt., less 2½%; this market keeps fairly steady, and some limited business continues. **Citric Acid,** B.P., crystals, about 1s. 6d. per lb., less 5%; spot holders quote at this price, but any business would be at much cheaper prices. **Epsom Salts,** commercial quality, about £5. per ton, in bags; there is little activity here, and dealers' prices are unaltered. **Formaldehyde,** 40% volume, on spot, about £95.; forward delivery, about £75. per ton; most inquiry is for forward delivery at the easier prices mentioned. **Glauber's Salt,** commercial quality, £3. 15s. to £4. per ton, in bags; this product is seldom called for from dealers, whose prices show no change. **Lead Acetate,** brown, about £40. to £41.; white, about £42. per ton; business has been slower, and dealers are quoting at lower prices. **Litharge,** about £35. 10s. to £36. per ton; dealers in imported material are selling limited quantities at about these figures. **Lithopone,** 30% Continental red seal, £22. to £22. 10s. per ton; dealers continue to find some limited business at about these figures, with the market keeping very steady. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; occasional business has been done at a shade under these rates. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers quote at these unaltered prices. **Oxalic Acid,** about 6d. per lb.; this market remains very much on the quiet side, with quoted rates unchanged. **Carbonate of Potash,** 90/92%, £26. 10s. to £27.; 96/98%, £30. to £31. per ton; dealers are quoting at these easier prices; but there is still no great volume of business on the market. **Chlorate of Potash,** crystals and granulated, about 3d. per lb.; the position is unchanged on the week. **Caustic Potash,** 88/92%, on spot, £30. to £31. per ton, in drums; dealers' prices have been substantially reduced for this product; the market remains dull. **Permanganate of Potash,** commercial quality, about 9½d. per lb.; there is a slightly easier feeling in this market, and fair business has been done. **Prussiate of Potash,** yellow, about 1s. 1d. per lb.; a further reduction has been made by spot holders, and business is still keenly competed for. **Sulphate of Potash,** 96%, £11. 10s. per ton, ex ship; there is no change in the position. **Mercury,** about £9. to £9. 5s. per bottle of 75/76 lbs; this market remains quiet, and prices show a further reduction, but the position appears somewhat steadier. **Red Lead,** imported, about £35. 10s. to £36. per ton; dealers quoting at about these levels are doing a limited business. **Salammoniac,** dog-tooth crystals, £48. 10s. to £49.; medium, £43. to £44.; fine white crystals, £25. to £26. per ton; dealers' prices, which were reduced last week, seem steadier this week, although the market is still quiet. **Saltcake,** ground and unground, home trade, about £4. 5s., delivered; export, about £5. to £5. 5s. per ton, f.o.b.; the tone holds very steady. **Acetate of Soda,** about £25. 10s. per ton; dealers are offering at about this figure, with little doing. **Soda Ash,** 58% light alkali, £7. 12s. 6d. per ton, in bags, carriage paid to destination; British makers' prices are unchanged for this product, for home trade only. **Caustic Soda,** 70/72%, £18. 10s.; 76/77%, £20. 10s. per ton, in drums, ex wharf, shipping port; dealers prices are so far unchanged, with practically nothing doing; British makers' prices have been reduced, with 70/72%, £16. 17s. 6d. per ton, and 76/77%, £18. 7s. 6d. per ton, in drums, on contract, for home trade, carriage paid to destination; prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers' prices are unchanged on the week, carriage paid. **Bichromate of Soda,** home trade, about 4½d. per lb., for export slightly more; British makers selling at these prices. **Cyanide of Soda,** 98/100%, export, 8½d. to 9d. per lb.; home trade, about 10d. to 10½d. per lb.; British makers' prices quoted. **Nitrate of Soda,** 96%, £13. 7s. 6d. per ton, f.o.r. Liverpool; the position shows no change on the week. **Nitrite of Soda,** 100%, about £26. 10s. to £27. per ton; the market keeps steady at this level rate. **Prussiate of Soda,** about 6d. to 6¼d. per lb.; a further reduction has been made by dealers in their quoted rates; business is still poor. **Hyposulphite of Soda,** pea crystals, about £15. per ton, in one-cwt. kegs; commercial quality, about £9. to £9. 10s. per ton, in casks; dealers are asking about these prices, with business restricted. **Sodium Sulphide,** 60/62%, solid, £14. to £14. 10s.; ditto, broken, £15. to £15. 5s. per ton, in drums; 60/65% concentrated, £14. 10s. in casks; prices quoted are about the same, with business dull. **Sulphate of Copper,** £25. 15s. to £26. per ton; dealers are offering Continental material at these and slightly easier rates; business is very limited. **Tin Crystals,** 1s. 4d. per lb.; there is no change on the week. **Tartaric Acid,** B.P., crystals, about 1s. 2d. per lb., less 5%; the spot position is weak; supplies are ample, with the demand very small, and the few sales made have been at very cut rates. **White Lead,** imported, about £43. per ton; dealers are finding a little business at about this figure. **Zinc Oxide,** B.P., about £51; white seal, about £43.; 99.5%, about £37. 10s. per ton, f.o.r. makers' works; British makers report their prices firm at these levels.

Pharmaceutical Chemicals.—The quietness of the market during August is more pronounced than usual. There are no changes of importance to record, but many items are rather unsteady owing to weak spot holders. **Acetanilid,** crystals and powder, about 1s. 6d. per lb.; some cheaper offers are being made for quantities, with little doing. **Acetyl-Salicylic Acid,** B.P., about 3s. to 3s. 1d. per lb.; it is difficult to obtain orders at the higher rate quoted. **Benzoic Acid,** B.P., about 2s. 6d. per lb.; no business recorded, quoted nominally. **Diethylbarbituric Acid,** B.P., (barbitone), about 18s. per lb.; there is no further fall in price to record, and market still flat. **Salicylic Acid,** B.P.,

2s. 3d. to 2s. 4d. per lb.; this market seems to keep up very well indeed, with fair business passing. **Tannic Acid,** leviss, about 3s. 4d. to 3s. 6d. per lb.; quoted at these levels on a slow market. **Amidopyrin,** about 14s. 3d. per lb; inquiry is only occasional, for small lots. **Ammonium Bromide,** about 7d. per lb.; there is no improvement in this market, and values are weak, with business poor. **Benzonaphthol,** about 5s. per lb., nominal; no interest shown in spot offers. **Benzaldehyde 03,** 3s. per lb.; some little business has been done at about this level. **Betanaphthol,** resublimed, 1s. 11d. to 2s. per lb.; the demand for this article remains slow. **Calcium Lactate,** 1s. 9d. per lb.; this market keeps quite steady, with business moderate. **Chloral Hydrate,** duty paid, 4s. per lb.; some sales have been made at about this figure of small quantities. **Creosote,** B.P., 2s. 5d. to 2s. 6d. per lb.; at these rates the market seems quite steady, although not at all active. **Creosote Carbonate,** about 8s. 6d. per lb.; spot holders are finding only small business—quoted rates unaltered. **Guaiacol Carbonate,** about 8s. 3d. per lb.; the market remains almost inactive, and dealers' prices unchanged. **Hexamine,** about 3s. 9d. per lb.; there is a slightly steadier tone here, but the market is still affected by a few cheap offers. **Hydroquinone,** about 3s. 6d. per lb.; inquiry has been small during the week, and prices quoted are not firm. **Methyl Salicylate,** about 2s. 6d. per lb.; this rate is being asked in most quarters, and some fair business has been done. **Methyl Sulphonal,** about 15s. per lb.; this market keeps rather dull, with quoted rates easy. **Paraformaldehyde,** 3s. 6d. per lb.; a steadier tone is recorded here, and a slight recovery may take place. **Paraldehyde,** 1s. 5d. to 1s. 6d. per lb.; spot offers are being made at these figures for good quantities. **Phenacetin,** about 6s. per lb.; business on spot remains quiet, and prices still tend to weaken. **Phenazone,** about 7s. 6d. per lb.; sales are mostly slightly cheaper than the quoted rate given. **Phenolphthalein,** about 6s. 6d. per lb.; this item is none too steady at this quoted rate. **Potassium Bromide,** B.P., crystals and granular, 6¼d. to 6¾d. per lb.; the position on spot is as reported last week, stocks ample, demand small, market unsteady. **Potassium Permanganate,** B.P., about 10d. per lb.; this market seems quite good at this level, with a fair business passing. **Potassium Sulphoguaiacolate,** about 5s. 6d. per lb.; this market remains neglected, with quotations unchanged. **Sodium Benzoate,** about 2s. 6d. per lb.; the market appears to be idle. **Sodium Bromide,** B.P., crystals and granular, 7d. to 8d. per lb.; offers on spot are varying, with some big lots at cheap rates; business has been poor. **Sodium Diethylbarbiturate,** about 18s. 6d. per lb.; quoted rates show no further drop in value, but there is hardly any inquiry about. **Sodium Salicylate,** powder, about 2s. 5d. per lb.; crystals, about 2s. 8d. per lb.; pure flake, about 2s. 11d. per lb.; inquiry has been fairly good, with not much spot material on offer; prices seem firm. **Sulphonal,** about 14s. 6d. per lb.; this market remains very flat. **Terpin Hydrate,** about 1s. 9d. per lb.; a steady but quiet market. **Thymol,** about 15s. per lb.; some offers are said to be at cheaper rates than that quoted.

Coal-tar Products, Intermediates, etc.—Business is still very limited in volume. Carbolic acid crystals are again a shade cheaper. Pitch is almost nominal. Creosote oil is somewhat easier. Other products are unaltered on the week. **Aniline Oil,** about 9d. to 9½d. per lb., drums free; this market remains slow, with quoted rates unchanged. **Aniline Salt,** 9½d. to 10d. per lb., casks free; there is no change here, market dull. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; quoted rates are level, with little business about. **Benzol,** 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; the quotation given is unchanged, with business very quiet. **Toluol,** about 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; quoted rates have reverted to their recent level. **Xylol,** pure, 2s. 3d.; commercial, 1s. 9d. per gallon, drums extra; the market remains dull, with values unchanged. **Naphtha,** about 1s. 4d. per gallon; there is no further reduction in price to record, but the market is still flat. **Heavy Solvent Naphtha,** 90/190, about 1s. 4d. per gallon, drums extra; prices mentioned are unchanged, but the market is quiet and weak. **Solvent Naphtha,** 90/160, 1s. 5d. per gallon, drums extra; there is little business about, and quoted rates are not at all firm. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; there is no change to record here. **Burning Oils,** crude No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; there is no change record, business slow. **Creosote Oil,** about 9½d. per gallon, f.o.b.; slightly easier rates are being quoted, with inquiry small. **Carbolic Acid,** crystals, about 1s. 1½d. per lb., f.o.b.; dealers are offering at the slightly reduced figure on a quiet market. **Naphthalene,** £20. per ton; dealers' quotations are maintained at about this level; crude, £7. to £13.; flakes, £24.; powder, £17.; crystals, £23.; balls, £24.; tablets, £28.; candles, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; dealers' prices are unchanged, with the market flat. **Pyridine,** 20s. per gallon; this high rate is fully maintained, with spot material very scarce. **Hexamethylene,** about 3s. 9d. per gallon; this market seems steadier after recent reductions in prices. **Pure Methyl Alcohol,** £100. per ton, ex wharf, London; values are well maintained on a steady market. **Pitch,** about 140s. per ton, spot, London; this market is reported quiet, but inquiry for next season is expected shortly. **Sulphate of Ammonia,** home trade, about £14. 10s. per ton; business remains very restricted.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £63. to £63. 2s. 6d., cash; £63. 15s. to £63. 17s. 6d., three months; electrolytic, £68. 15s. to £69. 5s. **Tin:** Standard, £193. 5s. to £193. 7s. 6d., cash; £194. 7s. 6d. to £194. 10s., three months; Straits, £197. 5s.; English, £194. **Lead,** soft foreign, £24. 12s. 6d., prompt; English, £33. 12s. 6d.; chemical sheet, 34s. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 2s. 6d.; hard, £27. 5s. **Antimony,** English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £8. 15s. to £8. 17s. 6d. **Bismuth,** 10s. **Platinum,** 500s. per oz. **Wolfram,** spot, 12s. 6d. to 12s. 9d. per unit, c.i.f. United Kingdom or Continent. **Zinc Dust,** quotations are as follows: Highest grade English, 90—92%, £47. 10s. per ton, delivered; Beaver brand, 90%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. There is no Australian material on offer, stocks having been cleared.

MANCHESTER CHEMICAL MARKET. Wednesday.

Business generally continues exceedingly flat, both for home and export trade, with very little promise of improvement, and prices still show a downward tendency. Quotations for **Alkali** products remain steady at the recent reductions. **Bleaching Powder** is easier at £11. 5s., softwoods on rails, and there is only small inquiry. **Chlorates** are moving off slowly, **Potash** 3d., and **Soda** 2¾d. per lb., carriage paid. **Bichromates** unaltered. The export inquiry for **Saltcake** continues brisk, but there is little doing in the home market, and prices are firm at £4. 10s., carriage paid. **Glauber's Salt** has a slow sale at £4., carriage paid. Amercian **Sulphur** steady at £5. 5s., ex store. **Copper Sulphate** is in small demand, and price nominal at £26., f.o.b. **Phosphate** and **Commercial Hyposulphite of Soda** without improvement. **Nitrite of Soda** scarce on the spot, and price is firm at £26. 10s., ex store. White powdered **Arsenic** has an easier tendency; to-day's price for Cornish brand is £68., on rails, at works. The demand for **Yellow Prussiates** is slow; prices nominally 1s. 1½d. for **Potash** and 6¼d. for **Soda. Carbonate** and **Caustic Potash** is in rather better request, but price easy. Grey and Brown **Acetate of Lime** are unchanged in position or value. Prices for **Acetic Acid** and **Acetate of Soda** are steady, but only small business is reported. **Lead Salts** have a higher tendency; spot quotations are firm; white **Acetate** £41., brown £43.; **Nitrate,** £42., delivered. All **Zinc, Tin,** and **Ammonia Salts** are lower. **Barium Chloride** easier at £14. 10. on rails. **Oxalic Acid** in only small demand, and price weak at 5¾d. to 6d. per lb. Green **Copperas** continues to move off readily, but prices do not show much improvement. **Permanganate of Potash** firm, at 9¾d. per lb.

SWANSEA MARKET REPORT. Wednesday.

More interest is being exhibited in **Tinplates,** and business is on the increase; quotations are based on £1. 3s. 1½d., per standard box, f.o.b. **Galvanised Sheets** are firm at

£18. 7s. 6d. per ton. **Copper** better; prompt, £64. 2s. 6d. per ton, and three months, £64. 17s. 6d. **Tin** somewhat irregular at about £190. 12s. 6d. per ton prompt, and £191. 12s. 6d. three months. **Lead** quiet at £24. 7s. 6d., prompt delivery, and £24. 10s. 6d. forward; English, £25. 15s. **Spelter** dearer at £33. 12s. 6d., and for three months, £31. 17s. 6d. per ton. **Zinc Sheets** firmer at £39. 2s. 6d. per ton. **Linseed Oil,** raw, £2. 3s. 3d., boiled, £2. 5s. 3d. per cwt. **Cottonseed Oil,** common edible, £2. 2s. 3d.; and deodorised, £2. 5s. 3d. **Coconut Oil** firm at £2. 1s. 9d. per cwt. **Olive Oil** steadily quiet at £66. 17s. 6d. per ton. **Rape Oil** dull; best refined, prompt, £2. 3s. 3d. per cwt., net, in barrels. **Cod Oil** quiet, with Newfoundland at £1. 19s. 3d. per cwt., ex ship. **Palm Oil,** quietly steady; Lagos, £34. 15. 3d.; mediums, £35. 10s. 6d.; softs, £34. 10s. 6d., prompt, and £34. 15s. 6d. forwards; hards, £35. 15s. 6d. per ton, at docks. **Turpentine** quiet at £3. 13s. 9d. per cwt. for American refined. **Sulphate of Ammonia** quiet, with home trade quotations at £13. 7s. to £14. 10s. per ton, delivery over month. **Sulphate of Copper** dull at £26. 7s. 6d. per ton, less 5%. **Nitrate of Soda** in slow trade at £13. 7s. 6d. per ton, in cwt. bags. **Bone Meal** dull at £9. 2s. 6d. per ton. **Oxalic Acid** remains quiet at 6¼d. per lb. **Sulphuric Acid** in better request. **Arsenic** quiet at £71. 17s. 6d. per ton, for white powdered. **Benzol** in good call at 1s. 4d. per gallon at ovens. **Pitch** rather easier at £6. 12s. 6d. per ton. **Copperas** quiet at £2. per ton, delivered. **Coal** prices steady for Admiralty qualities, with best smokeless at £1. 9s. 3d.; seconds, £1. 8s. 3d.; ordinaries, £1. 7s. 3d.; Monmouthshire black vein, £1. 8s. 6d.; all per ton, f.o.b. **Anthracite** was keenly inquired for, with rising prices; best large, £2. 10s.; seconds, £2.; Paris nuts, £3. per ton, all f.o.b. **Patent Fuel** in quiet request from £1. 10s. to £1. 13s. per ton, f.o.b. **Cokes** rather dull, with export prices £2. 7s. 6d. per ton, f.o.b.; foundry £2., and furnace £1. 10s.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Inquiries for chemicals of the heavier class, for use in the United Kingdom, have been made more freely, conditions in the principal consuming industries being more settled. In the export branch of the trade, business with distant markets has gone on more actively and shipments have been fairly heavy. **Bleaching Powder** has been rather more in demand for the home trade, and has had a fair shipment on foreign account; it is £10. 5s. to £10. 17s. 6d. per ton for use in the U.K., and £11. 5s. to £11. 17s. 6d. per ton for export. **Chloride of Calcium** has had a moderate sale, and is £5. 12s. 6d. per ton. **Caustic Soda** has been in fair request for home-trade uses, and has had a fairly active shipment to distant ports; the price for use in the U.K. and for export is £19. to £20. per ton, carriage paid. **Bicarbonate of Soda** has been in very fair demand for home-trade uses, and has had a fairly heavy shipment for foreign ports; it is £10. 10s. per ton, carriage paid, for use in the United Kingdom. **Soda Crystals** have had a steady sale on home-trade account, but have been quiet in the export branch; they are £5. 5s. per ton for home-trade uses. **Nitrate of Soda** has again been in moderate demand, and is £13. 5s. to £13. 10s. per ton. **Borax** has had a very fair inquiry, and is £26. 10s. to £27. 10s. per ton for commercial crystals, and £28. for powdered; higher grades are £31. per ton for crystals, £32. for powdered, and £33. for superfine. **Saltcake** has had a steady inquiry; it is £4. 10s. to £5. per ton for use in the U.K., and £5. to £6. per ton for export. **Bichromate of Soda** has been but little in request, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has been rather more in demand on home-trade account and has had a heavy shipment for export; the price is £7. 12s. 6d. per ton for the home trade, and £8. per ton for export, varied according to destination. **Hyposulphite of Soda** has been more in demand, and is £10. to £10. 10s. per ton, in 2cwt. bags, for commercial, and £15. to £16. per ton, in 1cwt. kegs, for photographic. **Sulphide of Soda** continues quiet; solid is £14. 10s. to £15. per ton, and crystals £9. to £10. per ton. **Chlorate of Soda** has been inactive, and is 3d. to 3¾d. per lb. **Phosphate of Soda** has been very quiet, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been but little called for, and is 6¾d. to 7d. per lb. **Yellow Prussiate of Potash** has been in fair request, and is 1s. 2½d. to 1s. 3d. per lb. **Red Prussiate** has been but little called for, and is 3s. 3d. to 3s. 6d. per lb. **Carbonate of Potash** has had a limited inquiry, and is £25. to £33. per ton, according to quality. **Nitrate of Potash** has had a very fair sale, and is £33. to £35. per ton for refined. **Chlorate of Potash** has been quiet, and is 3½d. to 4d. per lb. **Caustic Potash** has been more in request, and is £32. to £33. per ton. **Permanganate of Potash** has been in rather good demand, and is 9¾d. to 10d. per lb. **Bichromate of Potash** has had a moderate sale, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been in quietly steady request; first quality is £63. per ton, second quality is £60., and third £57. **Sulphate of Ammonia** has been but little in demand for home-trade use but has had a heavy shipment to overseas ports; it is £14. 10s. per ton for neutral of 25¾%, and £13. 7s. for ordinary of 25¼%, for use in the U.K. **Carbonate of Ammonia** has been in fair demand, and is 4d. per lb. **Muriate of Ammonia** has had a small sale, and is £32. to £33. per ton. **Magnesia** has been steadily called for; **Carbonate** is £2. 5s. per cwt., and **Sulphate** from £5. to £6. per ton. **Alum** has been in quietly steady demand, and is £12. per ton for home-trade uses, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has had a moderate inquiry, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been steadily called for; flowers are £10. per ton; roll is £8. 10s. per ton; rock £8. to £8. 10s.; and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has had a fair inquiry, and is 1s. 2½d. to 1s. 3d. per lb. **Cream of Tartar** has had a somewhat freer sale, and is £4. 10s. to £4. 15s. per cwt. **Boric Acid** has been more inquired for; commercial crystals are £52. per ton, and powdered £58., £2. per ton extra being charged if in casks. **Citric Acid** has been in moderate demand, and is 1s. 7½d. to 1s. 8d. per lb. **Oxalic Acid** has been but little in request, and is 6¼d. to 6½d. per lb. **White Acetate of Lead** continues quiet, and is £42. to £43. per ton. **Sulphate of Copper** has had a small sale for use in the U.K., and has moved but slowly in the export branch; it is £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been more in request; white powdered is £68. per ton.

WEST OF SCOTLAND CHEMICALS. Wednesday.

There has been a rather better demand for chemicals on home-trade account during the week, though inquiries for export are scarce. On the whole, prices generally continue steady at about previous figures. Arsenic and citric acid are lower, but brown acetate of lead is rather better. Quotations, at Glasgow, are as follows:— **Alum,** quiet, and in small demand; prices steady at £12. 5s. for lump, and ground £12. per ton. **Arsenic** continues in short request, and supplies are still very scarce; the quotation is further reduced to £74. per ton, net, on spot. **Barium Chloride** remains very quiet, despite the recent reduction to £15. per ton. **Bleaching Powder** does not show much movement, and the quotation stands at £11. 7s. 6d. **Boric Acid** and **Borax Crystals** are little sought for; makers' prices for the former stand at £50. per ton, and £27. per ton for the latter. **Borax,** granulated, is on offer at £26. 10s. per ton net, in 2cwt. bags. **Calcium Chloride,** 70—75%, solid, £5. 12s. 6d. per ton. **Citric Acid** is a quieter market, with the price shaded at 1s. 7d. per lb., less 5%. **Copper Sulphate** is but little in request at last week's figure at £27. 10s. per ton, less 5%, at Liverpool. **Cream of Tartar** quieter, with smaller inquiry at £4. 7s. per cwt. for 99%, at Glasgow. **Lead Acetate** is in fair request; brown rather better at £41. 10s. per ton, net; and white steady at £41. 10s. per ton, net. The market for **Magnesium Chloride** is slow, with quiet business at £3. for spot. **Oxalic Acid** is 6¼d. per lb. **Paraffin Wax** experiences a quietly steady trade at 2½d. per lb. **Potash Salts** remain generally steady, with **Bichromate** at 5¾d.; **Chlorate** in request at 4d.; and **Prussiate** rather dull at the lower figure of 1s. 3¼d.; all per lb. at Glasgow. **Salammoniac** indicates only quiet business at £60. and £57. for first and second lump respectively; crystals steady at £48. 10s. per ton. **Saltpetre** is £1. 10s. per cwt., but business is nominal at this reduced figure. **Sodium Bichromate** remains steady, with business on the basis of 4½d. per lb. **Chlorate** is quieter at 3½d.; white **Prussiate** continues in steady demand at 10½d. per lb. **Bicarbonate of Soda** is in good supply at £9. 15s. per ton, in 2cwt. bags; and £11. 10s. in 1cwt. kegs. **Tartar Emetic,** 43—44%, rather easier, and inclined to be dull at 1s. 1d. **Tartaric Acid** still shows a quiet tendency at 1s. 2¾d. per lb., less 5%, Glasgow.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

GLASGOW.

Week ending August 25.

ACETIC ACID—
Antwerp, 1 brl.

BEESWAX—
Lisbon, 105 bls.

BITUMEN—
New Orleans, 1,912 brls.

CARBON BLACK—
New Orleans, 100 cs.

COAL TAR PRODUCTS—
Tar
Kota, 12 brls., 1 cs.

CREAM OF TARTAR—
Bordeaux, 1 ck.

DYESTUFFS (NATURAL)—
Cutch
Rangoon, 650 bxs.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

The price of single copies is 6d. each, postage extra.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE BRITISH ASSOCIATION.

ON Wednesday next, at Liverpool, the British Association commences its ninety-first annual meeting. This is the fifth occasion that Liverpool has been chosen as the meeting place, the last being in 1896, when Sir Joseph Lister was president. A very interesting programme has been drawn up for each of the Sections, and, as usual, a number of valuable joint discussions have been arranged. The presidential chair is occupied this year by Sir Ernest Rutherford, whose address on "The Electrical Structure of Matter" promises to be of outstanding importance. With regard to the Chemistry Section, the president of which is Professor F. G. Donnan, and the vice-presidents Dr. E. F. Armstrong, Professor E. C. C. Baly, and Principal J. C. Irvine, the proceedings are to be mainly academic, none of the great problems of industrial chemistry being more than touched upon. A complete list of the papers to be read before the Chemistry Section is given on another page, and it will be seen that whereas the principal contributions and the joint discussions centre round modern physico-chemical theories; a number of what may be termed the minor contributions do deal with matters of more immediate practical importance. Thus, Professor H. E. Fierz will deal with the sulphonation and nitration of naphthalene; Mr. W. G. Palmer with catalytic actions in the presence of copper; Professor G. S. Whitby, the well-known Canadian rubber chemist, with the nature of Hevea rubber; and Dr. E. F. Armstrong with enzymes. The presidential address of Dr. C. Crowther to the Agricultural Section on "Science and the Agricultural Crisis" should not be without considerable importance to chemists. The arduous and enthusiastic work of the local Liverpool secretaries of the Association has been rewarded by a more than usual display of local interest in the proceedings, and there is every indication that the exhibition of scientific apparatus will be very well attended. The social side of the meeting has not been neglected, and a large number of visits have been arranged to local factories and other places of interest. The British Association makes a greater appeal to the popular imagination than does any other scientific body in the world, and whatever be the criticisms as to procedure that may be levelled against it, its value as a force in diffusing knowledge of modern scientific thought cannot be over emphasised.

AN INTERNATIONAL QUESTIONNAIRE ON FERTILISERS.

We have received from the International Institute of Agriculture at Rome a copy of a comprehensive questionnaire on fertilisers that the Institute is circulating to the Governments of all the adhering States and to that section of the Press especially informed on fertilisers. The step taken by the International Institute is the direct consequence of a resolution adopted at the last General Assembly, to the effect that the Permanent Committee should make an inquiry as to the most suitable measures to be taken to increase the production and use of fertilisers. It is unfortunately too true that at a time when increased agricultural production is a paramount necessity, the prevailing economic conditions have brought about a considerable diminution in the amount of nitrogenous and other fertilisers consumed in nearly all countries of the world. The suggestion of a practical method for increasing very appreciably the world consumption is, however, not an easy matter, but it cannot be disputed that a complete and accurate survey of the whole position both with regard to the actual and potential production and consumption of fertilisers is an essential preliminary. There is probably no other branch of the chemical industry concerning which statistics are more abundant and—with the exception of Chilean nitrate of soda—more conflicting, than the fertiliser branch, and this is particularly true of the Continental position. The questionnaire ranges over every aspect of the industry, technical, statistical, and commercial, and general instructive suggestions are also invited. It is desired by the Institute that replies be furnished by the European States before October 31 and by other States before December 31. The time allowed is certainly rather short for the compilation of statistics and information of the magnitude required, but it is to be remembered that the matter is urgent.

THE LATE DR. MUSPRATT.

By the death of Dr. Edward Knowles Muspratt, an outstanding figure has been removed from British chemical industry, and from the pioneers of British scientific and technical education, and one of the few remaining personal links with the early days of the alkali industry has been severed. Although Dr. Muspratt made no direct contribution to chemical technology, by his great administrative and commercial ability he extended greatly the growing industry established by his father, James Muspratt, and steered it successfully through periods of exceptional difficulty. As Dr. Conroy, the present chief chemist to the United Alkali Company points out on another page, Dr. Muspratt's early years in Germany, and his association with the great chemist Justus von Liebig, convinced him of the value of an efficient system of scientific and technical training to his own country, and he did not delay in translating his beliefs into action. Dr. Muspratt's interests were extraordinarily extensive. A keen student and critic of the arts, a great traveller and a politician of very definite views, he also took an active part in moulding public opinion on legislation directly or indirectly affecting the chemical industry. It is in his work as a whole-hearted and active supporter of scientific education and research however, that his chief title to remembrance depends.

DYE TROUBLES IN AMERICA.

An incident which aroused considerable interest in British colour-using circles some months ago, is recalled by a recent decision of the United States military authorities. It may be remembered that a contract for dyeing cotton uniforms was given by the U.S. Marine Corps to a British firm, and that the bids of American manufacturers were rejected. Rumours of a secret British dyeing process were circulated freely in the Press, but it appears that the method used was simply the application of the well-known mineral colours, work in which the British dyers have certainly had more experience than their American rivals. Before the war the distinctive olive drab cotton uniforms as worn by General Pershing's men were dyed with German vat colours, and the results were perfectly satisfactory. To-day a quite different state of affairs prevails. The American dyes used fade speedily under army conditions of wear and tear, and the average infantry company presents apparently quite a variegated colour effect. That the trouble is really serious may be gauged from the established fact that the wise American soldier, so soon as he receives a new uniform, at once sets to work upon it with bleaching powder lest he be mistaken for a raw recruit. The army authorities have now decided that this state of affairs is not to continue, and, not wishing to send their uniforms overseas to be dyed, have approached the American Chemical Society for assistance. As the result a joint committee has been formed, and a comprehensive series of tests on cotton uniforms dyed with American vat colours, mordant colours, mineral colours, and sulphur colours, is to be made. Neither the mineral nor the mordant dyestuffs are viewed with favour, and it is hoped to get satisfactory results with the sulphur colours, although, if necessary, the expensive American-made vat dyes will be used.

THE CHEMICAL SHARE MARKET.

With this issue we recommence the publication of our monthly stock and share list, which was discontinued temporarily during the war period. It is felt that such a list is of definite value, not only to our numerous overseas readers, but also to our home subscribers as a ready means of reference and a convenient permanent record of the fortunes of our leading chemical and allied enterprises. As to the exact form of the list it has been decided that the highest and lowest quotations on the London Stock Exchange afford the best means of indicating the actual transactions during the month. In the majority of cases the ordinary shares are quoted, but in some instances other classes of shares have been selected. Particulars as to the amount and date of the last dividend have also been incorporated.

COCONUT OIL.

A SURVEY OF THE PRESENT POSITION OF THE INDUSTRY.

By "Omega."

COCONUT OIL in temperate zones is a fat of a soft white consistency, varying in colour from white to a light yellow, and before refining possesses a characteristic odour and taste. In tropical countries it is an oil, hence the name coconut oil and not coconut fat. Coconut oil is obtained from the kernels of the fruit of the coconut palms, *cocos nucifera* and *cocos butyracea*. These two palms flourish in many tropical countries, but mainly on the Malabar Coast of India, Ceylon, the Malay Peninsula, Islands of the Indian Ocean, and South Seas, East Africa and South America. The best type of fruit is obtained at low altitudes and between the latitudes of 10° South and 18° North, where the fruit contains from 20/25 per cent. of oil. The oil is stored as a reserve food material in the fruit and contains an enzyme which functions in such a way as to resolve the oil into a soluble material for plant assimilation.

Commercial Grades and Prices.

The introduction of coconut oil into Europe on a commercial scale commenced in 1815, and the importation has since steadily progressed both in the form of oil and of copra. During recent years three grades of oil have been recognised:—viz., Cochin, Ceylon, and Copra oils. (I), *Cochin Oil*, is generally regarded as being of superior quality, and is obtained as the name designates, from the Cochin district of China, and also from the Philippines. The oil is extracted by macerating the copra in heated water vats and skimming away the oil. The superiority of the Cochin variety of oil lies in the fact that the palm is grown under more suitable climatic conditions, the copra is whiter, the oil is extracted in a more skilled and experienced manner and consequently realises higher prices. Cochin coconut oil contains a very low percentage of free fatty acids. The current price of Cochin Oil is £47. per ton (August, 1923). (II). *Ceylon Oil*, the name of which refers to its geographical origin is considered of second grade quality, mainly due to the crude methods of native cultivation of the palms, and also to the lesser skill in manipulating the drying of the copra and extracting the oils. Modern methods of forestry and oil extraction are now being introduced into Ceylon, and a higher grade of oil is being exported. The present price of Ceylon oil is £45. per ton. (III.) *Copra Oil* is the product produced by various modern methods of expression, from the imported dried copra, principally in European countries and America. The quality of this oil is dependent entirely on the quality of the copra used, and the price varies accordingly.

Production of Coconut Oil from Copra.

After removal of the outer fibrous portion of the coconut (which provides the coir of commerce, used for cordage, and as a filling and spinning material), the kernel is extracted, cut into pieces and dried. The dried coconut kernel is termed commercially copra and is either pressed locally or exported to European countries or America for expression of the oil. The copra production for 1922 is estimated at 600,000 tons. The following are the copra imports into the United Kingdom alone, which are quoted from the current issue of the Board of Trade Returns.

	Weight (tons)	Value (£)
1913	30,868	896,707
1919	71,531	3,779,301
1920	57,368	3,283,361

The principal importing countries for copra in 1913 were:

	Tons
Germany	196,449
France	123,360
Russia	66,690
Austria-Hungary	33,605
England	30,868
Belgium	19,552
U.S.A.	15,298
Australia	5,861

Since the war a large amount of the German oil trade has been transferred to England and the U.S.A. The copra exported from the Philippine Islands alone in 1919 amounted to 140,000 tons, and the Ceylon exports were as follows:

	1919. tons.	1920.	1921.
Desiccated Coconut	33,700	25,900	44,000
Copra	87,931	67,894	68,371
Coconut Oil	33,799	25,371	24,236

Copra has found some application in confectionery under the name of desiccated coconut. The fresh coconut is reduced to shreds and desiccated or dried in special ovens. It will keep fresh for a considerable period of time, and is used as a substitute for almonds. The desiccated coconut industry is conducted mainly in Ceylon.

The Drying and Sterilising of Copra.

The art of drying the copra has been developed to a considerable extent, particularly in Cochin China, and on the Malabar Coast. The presence of excessive moisture promotes hydrolysis and rancidity, with subsequent decomposition and loss of fat. Until recently it was accepted that rancidity was produced consequent on the rupture of the glycerides into free fatty acids. Lately it has been shown that more important factors are the presence of moisture, air, ferments, bacteria and enzymes, and that the deterioration takes place before the oil is expressed from the copra, the micro-organisms thriving on the albuminoids. The water which is present, promotes enzyme hydrolysis. Dry copra or dry coconut oil does not become rancid if air and light are excluded.

The drying of the copra offers a good means of preservation and also affords an economy in freights. The method adopted in drying the copra has an important bearing on the quality of the oil eventually obtained. The methods at present in use are, sun drying, kiln drying and vacuum or reduced pressure rotary drying. Formerly the sun dried copra gave a better coloured oil and a higher grade product generally, but latterly with the introduction of modern machinery, copra dried by means of vacuum rotary driers is competing successfully with the sun dried variety, giving both an equal product and a large economy in the time of drying, together with a lower percentage of water in the copra and a consequently higher fat content. By modern methods the copra is sufficiently dried in the course of two hours, a good quality material being obtained with a moisture content of about 3 per cent. In this state the copra is not attacked by micro-organisms, if it is preserved from access to air, light and moisture.

Investigations have been conducted upon the sterilising of copra by means of various gases and liquids, but up to the present no efficient agent which could be used without detriment to the copra from a commercial standpoint has been discovered. The table given below gives the oil content of copra dried by various methods:

	Oil content.
Sun dried copra	45-50 per cent.
Kiln dried	60-65 ,, ,,
Vacuum rotary dried	70-75 ,, ,,

Prior to the introduction of modern machinery, sun-dried copra in general gave a paler-coloured oil than that from the kiln-dried copra, and some markets are still prejudiced in favour of the sun-dried copra oil. A good quality copra should be perfectly white in colour, of a pleasant odour, free from extraneous matter and give a vitreous fracture. Insufficiently dried copra gives an inferior oil of high acidity. Copra is marketed under trade names designating its geographical origin, such as Manilla, Java, Malabar, Ceylon, Malay, and Seychelles copra The current prices (August, 1923), of Ceylon copra is £27. per ton, sun-dried Straits copra £25. per ton, Java copra £25. per ton.

Extraction and Refining of the Coconut Oil.

For the extraction of the oil from the copra the material is first crushed to a pulp or meal and then warmed or "cooked," so as to coagulate albuminous matter and also to allow the oil to be expressed more easily in the subsequent operation. The correct heating of the copra is an important factor in the production of a high-quality oil. The meal is pressed twice at a temperature of about 60° C., when about 60 per cent. of the oil is recovered, and is termed crude coconut oil, this oil containing from 2 to 9 per cent. of fatty acids. The residual cake meal, containing from 5-10 per cent. of oil, together with the major portion of the proteins, albuminoids, and carbohydrates, is used as a cattle food, the current price of the best quality coconut cake meal being £8. per ton (August, 1923).

Methods of pressing oil-bearing seeds and fruits have been known and employed from remote times. At the present time, the two modern systems are: (I.) The plate system for seeds requiring one pressing only, such as linseed; and (II.) the cage system for double pressing as for copra, which contains a high percentage of oil. The extracted oil is refined by various physical and chemical processes, so as to produce a colourless, odourless and tasteless material, and also for the extraction and exclusion of free fatty acids.

The refining of coconut oil for edible purposes is now an industry of considerable dimensions. The practice adopted differs in various countries, and depends on the use to which the oil is to be applied. The processes are being continually improved upon, as further experience of the oil is being gained, and also as the chemistry and composition of the oil, and its constituents are further studied. In practice the refining of coconut oil consists in the elimination of deleterious substances such as free fatty acids, mechanical impurities, inorganic substances and organic substances of the type of albuminoids, carbohydrates, gums, proteins and resins, ferments, enzymes, together with bleaching, the removal of odouriferous substances and the dispersion of any emulsions. A process which has found a wide application for the production of edible coconut oil, is by treatment with alcohol, and animal charcoal, when a white odourless product is obtained. Recently a patent has been granted for the bleaching of various vegetable oils, by exposing them in the form of thin films to ultra-violet rays. Pavlieck (*Seifensieder-Zeitung*, 1914, Vol. 41, p.566/568), proposes a method of refining coconut oil for manufacturing purposes, by treatment with 1 per cent. sulphuric acid, when the oil is bleached and impurities such as gelatine, albuminous matter, and alkaloids which cause the unpleasant taste are removed. This process is claimed to aid the subsequent deodourising operation, and also prevents rancidity. The reactions which take place are as follows.

$$C_{17}H_{33}COOH + H_2SO_4 = C_{17}H_{31}(OSO_2OH)COOH$$
$$C_{17}H_{34}(OSO_2OH)COOH + H_2O = C_{17}H_{31}(OH)COOH + H_2SO_4$$

Acid processes of refining coconut oil cannot be applied to oils which are to be used for edible purposes, as the first essential is that of flavour. Riley and Clark (*U.S. Pat.*, 1,320,094, 1919), have patented a method of refining coconut oil by adding a mixture of the coconut oil and a neutralising agent to a circulating solvent. The solvent containing the dissolved soap is removed from the dissolving zone, and the solvent recovered and used again for the treatment of a further quantity of oil.

Composition of Coconut Oil.

Coconut oil consists of a complex mixture of the glycerides of various fatty acids, the principal components being trilaurin, tri-myristin with lesser quantities of tri-stearin, tripalmitin, tri-olein, caprin and caproin. The results obtained by various authorities who have studied the composition of coconut oil are somewhat conflicting, but are in some measure accounted for, by the oil used being obtained from different sources and also expressed from the raw material at various stages of maturity. The following table gives the percentage composition as obtained by (I.) Ulzer, *Chem. Rev. Fett. und Harz Ind.*, 6, (II.) p.203-204; (III.) Elsdon, *Analyst*, 1913, Vol. 38, p.8-11; (III.) Lewkowitsch, Vol. 2, p.746:

	I.	II.	III.
Caproic Ester	2.5	2.0	0.25
Caprylic ,,	.5	9.0	0.25
Capric ,,	—	10.0	19.50
Lauric ,,	86.5	45.0	40.0
Myristic ,,	—	20.0	24.0
Palmitic ,,	—	7.0	10.6
Stearic ,,	—	5.0	—
Oleic ,,	10.5	2.0	5.4

Ulzer states that he failed to establish the presence of any tri-palmitin. Bömer (*Chem. Zeit.*, 1914, vol. 38, p.844), by distillation of coconut oil under high vacuum, found 75 per cent. caprylo-lauromyristin of M.P. 13°-15° C., some myristo-dilaurin of M.P.32° C., and a small amount of lauro-dimyristin of M.P.37-38° C. The non-volatile portion contained the glycerides of oleic and palmito-dimyristin of M.P.45° C., and some stearo-dipalmitin. Bomer found no glycerides of capric or caproic acids present.

The peculiar and complex chemical composition of coconut oil, renders it highly susceptible to rancidity on exposure to air, moisture, and light. The odiferous quality in coconut oil is due principally to the presence of traces of methyl-heptyl-ketone, methyl-nonyl-ketone, and methyl-undecyl-ketone, which are produced according to Lassieur by enzyme action on the copra (Lassieur, *Compt. rend.*, 1910, vol. 151, p. 697 and p. 1,013). The colour is due to the presence of traces of naturally occurring lipochromes, chlorophyll, and xanthophyll.

That coconut oil is easily saponified in the cold is remarkable in view of the fact that far the greater portion of fatty oils need considerable heat for saponification, and that coconut oil consists principally of the glycerides of the lower fatty acids is probably an important factor in many of its reactions.

Within recent years the hardening of coconut oil has attracted considerable attention. The hardening is attained by various processes of hydrogenation, with the aid of catalytic agents. Hardening raises the M.P. and the solidifying point, depresses the refractive index and the iodine value, leaving the saponification value unchanged. The following figures are typical of coconut oil before and after hardening (Leschly-Hansen (*Chem. Rev. Fett. Ind.*, 1912, vol. 19, p.218-221, 247-249).

	Before Hardening.	After Hardening.
Melting Point	25.6°	44.5°
Solidifying Point	20.4°	27.7°
Refrac. Index at 40° C.	37.4	35.9
Acid Value	0.3	0.4
Saponification Value	255.6	254.1
Iodine Value	11.8	1.0

The iodine value of coconut oil gives an indication of its unsaturated fatty acids content, and is reduced during the process of hydrogenation to about 1 per cent.

Properties of Coconut Oil.

At ordinary temperatures coconut oil is a white fat of bland taste. It is soluble in ether, alcohol and carbon bisulphide, and its physical constants are as follows:

Saponification Value	245/268
Iodine Value	8/9.5
Reichert-Meisel Value	6.5/8.4
Acetyl Value	9/13.2
Acid Value	5/50
Hehner Value	88/90
Polenske Value	18.0
Kirschner Value	1.8
Valenta Value	11.0
Melting Point	21/24° C.
Solidifying Point	22/14° C.
Specific Gravity at 15/15° C.	0.9250
Specific Gravity at 100/15° C.	0.8730
Refractive Index at 60° C.	1.442
Viscosity at 60° C.	63.9
Mean Molecular Equivalent	196/204
Butyro-Refractometer Value at 15° C.	49.1
Butyro-Refractometer Value at 40° C.	34.2

For 3ins. of oil:

Spectrum Visibility in the red ends at	43.28°
Spectrum Visibility in the blue ends at	47.3°

The physical constants of the fatty acids of coconut oil are as follows:

Neutralisation Value	260/266
Iodine Value of the Mixed Fatty Acids	8.4/9.5
Iodine Value of the Liquid Fatty Acids	36/37
Mean Molecular Weight	200/211
Refractive Index at 60° C.	1.4295
Melting Point	25/27° C.
Solidifying Point	20/16° C.
Titre Value	22.5/25.1° C.
Specific Gravity at 100° C.	0.8354

Coconut oil has the highest saponification value and the lowest iodine value of all known fats and oils. The values for typical vegetable oils are:

	Sap. Value.	Iodine Value.
Soya Bean Oil	190/193	110
Cotton Seed	193/195	122
Palm	196/205	55
Coconut	245/268	8.0

When distilled alone, coconut oil decomposes with the formation of acrolein and other degradation products. With

high pressure steam under vacuum, the oil partially saponifies with distillation of free fatty acids and glycerol. On heating with alkali hydroxides, coconut oil is saponified forming the soap and freeing the glycerol, with alkaline carbonates it is only saponified by heating in autoclaves under pressure. Treatment with superheated steam at a temp. of 200° C. (15/20 atmospheres pressure), promotes the hydrolysis of coconut oil into glycerol and free fatty acids. A compound consisting of sulpho-oleic acid with naphthalene readily hydrolyses hot coconut oil. During the last few years the hydrolysis or fat splitting of coconut oil by means of enzymes has attracted considerable attention, enzymes found in castor seed have been found to be most effective and have found some industrial application. Nicloux (*J.S.C.I.*, 1904, p.327) states that the enzymes contained in one kilo of castor seeds will decompose 100 kilos of oil in 24 hours at 20° C. The substance in castor seeds which exhibits lipolytic properties is the cytoplasma (Nicloux, *Compt. rend.*, 1904, p.1,175-1,177), and providing that the quantity of material used is sufficiently large to counteract any external conditions, Wilhelmy's general catalytic formula is applicable, where:

$$\frac{l}{t} \text{ Log } \frac{A}{A - x} = K.$$

A summary of Nicloux classical researches on lipolytic enzymes is to be found in "*Contribution a l'étude de la saponification des corps gras*, 1906."

Commercial Applications of the Oil.

The bulk of the coconut oil produced forms the raw material of soap and candle making, but the oil is used also for cooking and edible purposes. The commercial possibilities of coconut oil as a soap making material were recognised after the granting of a patent to Sturtevant (*Brit. Pat.*, 8,870, 1841), a patent which rapidly created a demand for the oil. Coconut oil soaps are very hard and combine with a large quantity of water without becoming soft. The soaps are also distinctive in the necessity for addition of a large proportion of salt to throw them out of solution. The manufacture of marine soaps from coconut oil is based on this fact. Its application as an edible oil is of comparatively recent date.

Coconut oil of high grade is now used in considerable quantities in the preparation of vegetable butters, cooking fats, margarine, and enters into the composition of cakes and biscuits. It appears under various trade names. On pressing low grade copras, the lower melting glycerides are used for soap making, the harder residue or stearin used for candle manufacture. The copra meal is rich in amino acids, which are of physiological value from a growth standpoint, and when mixed with green forage makes an excellent cattle food.

The Extent and Growth of the Trade.

The extent and growth of the coconut oil industry during late years, is seen from the following table from the Board of Trade Returns. It will be seen that there is a steady decrease in the importation of refined oil with a compensating increase in unrefined oil.

Imports of Coconut Oil.

	Weight (tons).			Value (£)		
	1913.	1919.	1920.	1913.	1919.	1920.
Refined	27,337	23,655	3,018	1,316,246	2,537,130	353,566
Unrefined..	31,140	52,617	63,059	1,342,400	4,354,319	5,804,393
Total	58,477	76,272	66,077	2,658,646	6,891,449	6,157,959

Exports of Coconut Oil.

Refined	2,946	441	2,111	141,777	44,312	228,457
Unrefined..	3,103	1,622	688	127,465	89,412	61,534
Total	6,049	2,063	2,799	269,242	33,724	289,991

The total imports of refined and unrefined coconut oil into the various countries during 1913 were as follows: England, 58,477 tons; U.S.A., 22,546 tons; France, 3,924 tons; Holland, 16,685 tons; Belgium, 1,285 tons; Russia, 397 tons; Austria-Hungary, 4,895 tons; and Germany, 594 tons.

Future Prospects.

The chemistry and technology of coconut oil has made vast strides during recent years. The results of the study of the physical and colloidal chemistry of the oil have found considerable application in several industrial processes. Solvent extraction of the copra has only been adopted in cases where the market price of the oil is sufficiently high, as in 1907, to discard the value of the meal cake as a feeding stuff for cattle. Prolonged studies have been made on the influence of physical factors, in various chemical operations, which are conducted on an industrial scale, where the use of coconut oil is involved. Much attention has been given to the question of deterioration consequent on rancidity, and also to the introduction of more economical methods for the expression of the oil, so as to render the refining operation less laborious, more easy of attainment and prevent losses due to enzyme activity.

The coconut oil industry offers a unique field for the application of scientific principles with marked advantage. Until recent years no method of cultivation of the coconut tree had been adopted, and the preparation of the copra and extraction of the oil were conducted in a very crude empirical manner. The future of the coconut oil industry lies in the placing of capital abroad so as to introduce modern methods of cultivation of the palms, and the general application of modern machinery and engineering.

AMERICA'S HEAVY CHEMICAL INDUSTRY.

EXPORTS DURING FIRST SIX MONTHS OF 1923.

THE exports of chemicals and allied products from the United States for the first six months of 1923 had an aggregate value of $75,125,022., an increase of 21 per cent. over the first six months of 1922, and equivalent to 67 per cent. of the total value of $112,836,432. for the entire year 1922. June, 1923, with exports totalling $14,120,320., was the record month, surpassing the previous high mark made in May by $754,748., and the figure for June, 1922, by $4,253,185.

Among the heavy chemicals which showed expansions in 1922, and which have continued to gain in 1923, are ammonia and ammonia compounds, aluminium sulphate, and dextrine. Acetate of lime and bleaching powder have each advanced in value, but declined in tonnage. On the other hand, during the first six months of 1923 large decreases were evident in the exports of calcium carbide, copper sulphate, and glycerine, all of which had recorded increases during the year 1922. The exports of heavy chemicals for the first half of 1923, as compared with the first half of 1922, are given in the following table:—

Exports of Heavy Chemicals from the United States.

Articles.	First Half of 1922.		First Half of 1923.	
	Pounds.	Value.	Pounds.	Value.
		$		$
Ammonia and ammonium compounds	2,287,454	510,171	3,415,170	541,100
Aluminium sulphate	12,066,218	185,722	17,308,240	264,085
Acetate of lime	16,510,592	332,820	15,501,117	538,938
Calcium carbide	8,919,285	371,101	3,292,775	141,232
Bleaching powder	17,203,797	284,675	16,792,974	287,248
Copper sulphate	4,132,793	191,258	1,417,374	80,131
Dextrine	7,717,670	244,141	8,803,293	327,372
Formaldehyde	1,041,632	114,497	690,070	112,167
Glycerine	1,871,167	272,972	697,261	135,618
Potassium bichromate	3,176,760	315,901	2,231,428	200,569
Potassium chlorate	303,451	25,920	131,585	13,921

No significant changes occurred in the foreign demand for sodas and sodium compounds as a group, 203,819,410 pounds, valued at $5,278,279., being shipped abroad from January to the end of June, 1923, as compared with 184,419,888 pounds, valued at $5,858,666., in the first six months of 1922, and 348,827,893 pounds, worth $10,222,634., in the entire year 1922. Advances were made in all the individual items under this group except in exports of caustic soda, which dropped one-third, from 89,607,806 pounds, valued at $3,302,943., in the first six months of 1922, to 58,703,050 pounds, worth $2,093,273., in the corresponding period of 1923. Exports of sodium cyanide rose from 1,642,113 pounds, with a value of $121,586., in the first half of 1922, to 2,685,678 pounds, worth $277,858., in the corresponding period of 1923; soda ash, from 14,121,207 pounds ($320,271.) to 14,350,720 pounds ($340,959.); sodium silicate, from 12,966,206 pounds ($136,494.) to 15,266,533 pounds ($143,195.); soda crystals, from 5,288,204 pounds ($87,327.) to 6,010,714 pounds ($87,589.); and sodium bicarbonate from 7,810,526 pounds ($173,772.) to 8,803,387 pounds ($203,378.).

INDUSTRIAL SILICA.*

CHARACTERISTICS SUITABLE FOR DIFFERENT USES.

SILICA, as used in the industries, is required in many different forms and grades, and each industry demands that the material comply with definite specifications. The classification to be adopted in the following article of the uses under the headings lump silica, silica sand, etc., is only a matter of convenience, for it will readily be seen that no definite line of demarcation can be drawn in commercial practice, since one industry may possibly use material from any one of these classes.

Lump silica, obtained from deposits of quartz, quartzite, or sandstone, has a number of uses. Some industries use the material just as it comes from the quarry, while others require a preliminary coarse crushing and screening to obtain material of a certain size. When employed in this form its commercial value is very small, and it is only when there is a large demand that it pays to operate a quarry for lump silica alone.

Use in the Manufacture of Ferro-Silicon.

Ferro-silicon is the most extensively used of the ferro-alloys produced in the electric furnace. It is made in two ways: (1) by the reduction of silica and iron ore with carbon; (2) by the reduction of silica with carbon, the iron content being obtained by the addition of iron turnings. The silica required for the manufacture of this alloy is obtained either from a pure grade of quartzite, or by using a highly siliceous, but otherwise pure iron ore. Chemical analysis gives a good indication of the suitability of a silica for this use. Material of the composition indicated below would be suitable:—

	Per cent.
Silica	97·00 to 98·25
Iron oxide and alumina	1·00 to 1·75
Calcium oxide	not to exceed 0·20
Magnesia	„ „ 0·20
Phosphorus and arsenic	Nil.

The iron oxide content does not greatly matter, except that it should be uniform. The objectionable impurities are calcium, phosphorus, and arsenic, as these are reduced in the electric furnace to calcium phosphide, and to calcium arsenide in the presence of carbon. These impurities remain in the ferro-silicon, and on coming in contact with water or moist air, give off phosphoretted hydrogen, or arseniuretted hydrogen, both gases being very poisonous. Apart from the danger from these gases, the ferro-silicon in which they occur shows a decided tendency to spontaneous disintegration, and on being stored for a few weeks crumbles and falls to powder, thus rendering the material useless.

The present requirements of the ferro-silicon industry, in the matter of silica, are, (1) a quartzite having approximately the above chemical composition, and (2) a compact and dense variety, broken to a size from 1 inch to 6 inches, according to practice.

Lump Silica as a Flux.

Silica is used as a flux in metallurgical operations, principally in the metallurgy of copper, where the original ore is basic. Whenever possible, the smelting companies endeavour to obtain a supply of ore which has a siliceous (free silica) gangue, to mix with the basic ore being smelted, otherwise it is necessary to use barren quartz, quartzite, or sandstone.

In true pyrite smelting, silica is used as a flux to remove the iron oxide formed, and produce a siliceous slag. The silica used for this purpose should not be in the form of a silicate, but should be free silica, such as quartz, quartzite, or sandstone, so that a strong acid is at once available to combine readily with the FeO as it forms. For this purpose the silica should be in lumps not less than one-half inch in diameter.

Silica is also used as a flux in the manufacture of phosphorus. For this purpose quartz is crushed to pass a 1¼-inch screen with as little fines as possible. A silica content of 99 per cent., or more, is required. Blocks of massive quartz and quartzite are used in the chemical industry as a filler for acid towers, and in some cases as linings for digesters in the pulp and paper industry. Flint or quartzite pebbles, well rounded, are used in ball or tube mills for fine grinding, the linings for the mills being composed of dressed blocks of quartzite, or else pebbles which are wedged in between steel ribs run longitudinally on the inside of the mill.

* Abstracted and rearranged from "Silica in Canada," a monograph compiled by L. Heber Cole for the Canadian Department of Mines.

Silica, in the form of sand, is an essential raw material in many industries. Its more important uses, and the requirements of each industry are briefly given.

The Raw Material for Silica Bricks.

Silica brick is now used extensively as a refractory material in the metallurgical industries. By far the largest part of the silica brick is manufactured from quartzites, since loose grained rocks—such as sandstones—are of little value for this purpose. One of the most striking differences between silica and clay firebricks is that the former expand when heated, while the latter contract. Hence, silica firebricks are chiefly used where great heat resistance combined with an absence of shrinkage is essential. On account of these properties they are used for the arches, crowns, and higher parts of furnaces and kilns, for the upper parts of glass furnaces, and all parts above the floor level in by-product coke ovens. The materials used in the manufacture of silica brick are quartzite, crushed to pass through an 8-mesh screen, and a bonding material to mix with it so that it can be moulded into shape. Some silica rocks, known as gannisters, contain sufficient bond, in the form of highly refractory clay, to render any addition unnecessary. The bond generally used is lime, about two per cent. being added to the crushed quartzite in the form of milk of lime. The quartzite and lime are milled thoroughly in wet pans, until a slightly cohesive mass is produced. The wet mass is moulded by hand, then partially dried, and afterwards re-pressed by machinery. When thoroughly dried, the pressed bricks are set in kilns which are fired to a finishing temperature of 1,500 degrees Centigrade.

The chemical requirements of a siliceous material suitable for a refractory brick vary; but the silica content should be as high as possible. A reliable chemical analysis is of very great importance therefore, since the refractoriness of the finished brick will depend on the silica content, and on the presence of such impurities as lime, alkalies, and iron, which tend to act as fluxes, and lower the melting point of the bricks.

The physical properties of the silica are of as much importance as the chemical composition. It has been found in testing a number of silica samples in the laboratories of the Mines Branch, that quartzites are preferable to sandstones or vein quartz, and that loose sand or gravel is altogether unsuitable, even though the chemical analysis is satisfactory. A quartzite, suitable for this industry, when ground, should have grains that are splintery, sharp, heterogeneous as to form and size, and slightly translucent. It should analyse approximately 97.5 per cent. SiO_2, 1 to 1½ per cent. Al_2O_3, and 0.75 per cent. other impurities; and when moulded into brick and fired, should expand and swell without perceptible cracking. The total fluxing materials in a silica brick should not exceed 3 per cent. In a gannister brick the clay content may run as high as 10 per cent.

Silica for the Glass Industry.

The silica used in the glass industry is generally in the form of sand. The greater part of the material used is obtained from natural sand deposits, or by crushing a friable or loosely bonded sandstone. It rarely pays to crush vein quartz or quartzite for glass manufacture, since the hardness of such materials greatly increases the cost of crushing, and there is also the danger of contaminating the sand with iron particles from the crushers. From long experience, the glass manufacturers have recognised certain properties which a sand should have to permit of its being classed as suitable for the manufacture of glass.

Impurities to be Avoided.

The sand should run as high in silica as possible. Objectionable impurities are metallic iron and compounds of iron, alumina, magnesia, lime, and alkalies. Iron oxide is the worst of the impurities found in glass sand, on account of its strong colouring power. The smallest percentage present in the sand tends to impart to the glass a green, yellow, or red colour, the intensity of which depends on the amount of iron oxide present. The following percentages seem to be the average limits allowable in common practice:

For optical glass, best grades:—

	Per cent. Fe_2O_3
Flint glass and soda lime glass	0·02 to 0·05
Plate glass	0·10 to 0·20
Bottles and window glass	0·20 to 0·35
Dark bottles	0·50 to 0·65 and higher.

When the iron oxide content is not above 0.20 per cent. the green colour can be neutralised by some decolouriser, such as manganese, selenium, cobalt, or nickel. Above 0.20

per cent. of iron oxide, the green colour is too intense to be entirely destroyed.

The presence of alumina in a sand, while it may be desirable for some purposes, tends, unfortunately, to decrease the transparency of the glass, and also makes the batch harder to melt. For the best grades of flint glass, therefore, the alumina should not be more than 0.10 per cent., while for plate glass or window glass it should not exceed 0.60 per cent., except in special cases. The form in which the alumina is present in the sand is of great importance, since if it is present as clay—a silicate of alumina with probably iron and magnesia—it is not readily soluble, while if it is in the form of feldspar it is soluble and not so harmful.

Sands containing lime are to be avoided, for, although lime is an important ingredient in many commercial glasses, the calcareous material in the sand is generally sporadic in its distribution, and unless daily analyses of the sand employed are made the lime content in the batch cannot be depended upon. It is preferable therefore to use a lime-free sand, and add raw limestone to the batch as required. Magnesia is generally present in glass sands in such small quantities that little trouble is caused by its presence. An excessive amount of magnesia (1 per cent. or higher) tends to raise the fusion point of the batch, and this is objectionable on account of the extra fuel required. The following analyses are of typical glass sands:—

—	1	2	3	4	5
	Per Cent.	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Silica	99·12	99·20	99·58	99·25	99·80
Iron oxide	0·07	0·17	0·02	0·04	0·006
Alumina	0·43	0·53	0·12	0·59	0·13
Lime	0·34	trace	0·13	0·11	trace
Magnesia	0·11	,,	trace	0·02	—
Alkalies	—	0·10	—	—	—
Loss on ignition	0·22	—	0·17	0·25	0·18

1. Belgian sand (Dominion Glass Co., Montreal).
2. St. Paul, Minn., U.S.A. (Bulletin on British Sand Resources, by Boswell).
3. Wedron Silica Co., Ottawa, Ill. (Bulletin on British Sand Resources, by Boswell).
4. Lynn Sand, England. (Sands Suitable for Glass Making, by Boswell).
5. Fontainebleau sand, France. (Sands suitable for Glass Making, by Boswell).

A general specification for the texture of a glass sand might be that all material should pass a 14-mesh screen, and 90 per cent. be retained on the 100-mesh, with 65 per cent. between the 20-mesh and the 65-mesh.

For use in carborundum manufacture the silica must be a sand of fairly uniform texture, and graded between the 20 and 100 mesh screens. The sand should test 99.5 per cent. SiO_2, and must not be lower than 99.25 per cent. While it is stated that alumina in small quantities is not injurious, lime, phosphorus, and magnesia should be entirely absent.

Steel Foundry Sand and Furnace Linings.

Silica finds one of its largest markets in steel foundries. In this industry it is used in the form of sand for making moulds for steel castings. Some sands are found in nature suitable for this purpose, but the greater number of castings are made in moulds consisting largely of a high silica sand, to which some artificial bonding material has been added. This bonding material consists of highly plastic fireclay, flour, molasses or other suitable material. A sand suitable for use in steel casting must have three essential properties—namely, good bonding power, high permeability, and great refractoriness. A tentative specification for a steel foundry sand for average castings might call for one in which the silica content was 97 per cent. or more, consisting of well-rounded grains, graded between the 20 and the 100 mesh, having an average fineness of from 35 to 48.

Silica is employed for lining certain types of metallurgical furnaces, notably Bessemer converters, matte smelting reverberatory furnaces, and electric furnaces for the melting of scrap iron.

In Bessemer converters the lining is usually composed of a highly refractory siliceous material, such as a crushed quartzite or silica sand. Silica, containing small proportions of a plastic refractory clay, either present naturally in the rock or added to the crushed material in the form of a plastic fireclay, is best suited for this purpose. The bottoms are made by ramming in this crushed silica, slightly dampened, together with a small amount of coke breeze. For making the hearth of matte smelting reverberatory furnaces silica sand is employed. Material required for this purpose should exceed 95 per cent. SiO_2, and should be of even grade. The size of grain in general use should be from 0.1 to 0,35 mm.

Sand for Fused-Silica Ware.

The production of apparatus made of pure silica, for use in chemical laboratories and manufacturing industries, has been made commercially possible by the adaptation of the electric furnace. Silica for use in this industry is required in the form of sand having similar texture and composition to the sand used in glass manufacture.

Other minor uses of silica sand are numerous. Quartz, crushed and graded to various sizes, is used to a small extent in making sandpaper and sand belts. For this purpose, quartz or massive quartzite is preferable to sandstone, since the grains resulting from the crushing of the sandstone have less angularity and do not cut as well as the sharper quartz fragments. Silica sand is also used in stone and plate glass grinding, as an abrasive with stone cutting saws, for frosting glass with the sand blast apparatus, and for many other industrial purposes.

Powdered Silica in the Pottery Industry.

Powdered silica is used in a number of industries. Silica in this form may be prepared from flint, quartz, quartzite, or sandstone. The more important industries using silica in the powdered form are briefly described.

The mining and preparation of siliceous rocks for use in potteries is one of the principal branches of the silica industry. The various kinds of pottery in which silica is used are table ware, sanitary ware, electrical porcelain, chemical porcelain, and white floor and wall tiles. About 35 per cent. of finely-ground quartz is used in the composition of the bodies from which these wares are made, the remainder of the body being clay and feldspar.

For this industry, it is necessary to have a silica that will burn to a dead white heat. Hence a high grade material, free from iron, if possible, is desirable. The iron content should not exceed 0.32 per cent. The material should all pass through the 120 mesh, and 90 per cent., preferably, through the 150 mesh. In the metal enamelling industry, silica is used as a partial substitute for feldspar in some of the cheaper grades of enamel. For this use it has been found, from practical observation, that the silica employed is better when not too finely divided. The material used should contain over 97 per cent. SiO_2, and less than 0.35 per cent. iron oxide.

Silica in the Manufacture of Paint.

The introduction of silica into paint manufacture dates back many years, and the modern floated silica is now classed as a standard pigment. Pure silica, in the form of an impalpable powder, is one of the most stable pigments known, being highly refractory, and practically insoluble in water and in all acids except hydrofluoric. It is, however, never used as a base paint, but may be added to some pigments—with the exception of siliceous ochres—up to 25 per cent., also to others, such as lamp black, the better grades of iron oxide pigments, and pure chrome green, up to as high as 50 per cent., without detracting materially from their value as a body paint.

Paints containing silica are the best for use on green lumber or material containing moisture, as the silica is said to allow the moisture to pass through the pores of the paint film, and at the same time is impervous to external dampness. It is also said to increase the durability of a paint.

For paint purposes, silica with a tooth is preferred, and, as a rule, clear, glassy quartz will yield a sharper grain than opaque massive varieties, no matter how fine the silica may be ground. The material should be well over 95 per cent. SiO_2, and free from iron or other colouring impurities. The essential quality for its employment in the paint industry is its colour, which should be perfectly white. The finer the material is ground the better suited it is for paint manufacture, and as employed, it is generally in the form of water, or air floated silica, or else bolted.

For the manufacture of sodium silicate the silica is preferred in the form of a pure diatomaceous earth, or as a finely powdered flint, quartz, etc., and should be as pure as possible.

Numerous uses of silica in the powdered form are found in many industrial processes. It is used extensively as a filler and scouring substance in hand soaps, for dusting moulds in foundries, in roofing papers to keep the rolled sheets of tar paper from sticking, in dental work as a detergent, in numerous chemical operations, and as a filler in paper and rubber goods. It also enters into the composition of match heads, and is used as an abrasive for polishing pearl and bone buttons, and for the making of metal polishes.

THE MONTH IN ENGINEERING.

[Specially Contributed.]

A New Multiple Retort Stoker.—In the domain of the mechanical firing of steam boilers, especially in the case of the larger types of water-tube boiler, the struggle for supremacy to-day is between the improved travelling grate compartmented air-supply type of stokers and the multiple retort type. There is considerable difference of opinion as to the advantages and disadvantages of these respective designs, and it is very difficult to give a general opinion, as so much depends on the individual conditions. In brief, however, the chief advantage of the multiple retort stoker is that no firebrick arches are required, thus allowing the radiant heat to pass directly into the boiler tubes, whilst eliminating at the same time the cost of upkeep and repair of these arches. In addition, the combustion is very slow and gradual, with thick white hot fires. The disadvantages are the high air pressure required—often as much as 4-5 inches water gauge—to force the air through the fire, this type of stoker being worked entirely with mechanical forced draught. Also, in the case of coals with a low melting point ash, fusion takes place easily, and this forms a very serious obstacle to the passage of the air, reducing both the efficiency and the output.

The improved travelling grate stoker has the advantages that the coal rests quiet on the bars for the whole length of the travel, and that the fires are much thinner, whilst the air supply is under perfect control at every stage, the chief disadvantage being perhaps the use of firebrick arches. Broadly speaking, the travelling grate stoker is better for inferior coals, and particularly those that have a tendency to form clinker and are highly coking, whilst the multiple-retort stoker is more adapted for good-quality coal with mild coking or non-coking properties. The Underfeed Stoker Company, Ltd., who are well known for a great variety of mechanical stokers, particularly of the travelling grate type, have placed on the market recently a much improved multiple retort stoker, known as the "Underfeed Type F" stoker. This is on the latest principles, with a series of stationary retorts side by side, and having at the bottom very slowly reciprocating rams, which cause the deep mass of coal to travel downwards through the retort as it is being burned. The forced-draught air supply is through tuyère grate blocks in the sides of the retort as usual, whilst a special feature is that the brickwork nearest the top of the retort, and also that of the ash discharge at the bottom, are hollow and air-cooled, so as to reduce wear and tear. Both the supply of coal from the hopper by means of the slow-moving rams and the air supply are as usual under easy control. Another characteristic is the efficient nature of the ash dumping grates at the end, which allow a deep layer of ash and clinker to accumulate at the bottom so as finally to complete the combustion whilst at the same time to prevent any excess air passing at this point. The installation can also be provided with an electrically driven reciprocating ash and clinker crusher which delivers continuously and automatically the crushed clinker taken from the thick mass on the dumping grates. Altogether this apparatus is a decided addition to the range of multiple retort types of stoker on the British market.

The Economical Working of Refrigerator Plant.—Increasing attention is being given in every direction to the possibilities of economical working in industry, and one section of this work which is attracting considerable notice in the United States is in connection with the improved running of refrigerator plants, which seems to be an unusually fruitful field for money saving. It is pointed out in the first place, that most refrigerator plants are being worked at a much lower pressure in the coils than is really necessary. The correct practice in most cases is about 20lb. gauge in the coils, at which pressure the liquid ammonia boils at 6° F., corresponding to a temperature being maintained in the cold storage room of 19-20° F. (It is usual to allow approximately 12° F. difference between the temperature of the cold storage rooms and that at which the ammonia evaporates in the coils, assuming that the latter are a reasonable distance from the rooms. In most cases, however, at the standard cold storage temperature of 20° F. the ammonia coil pressure has to be much below 20lb., which means loss in various directions. This may be due to many reasons, one of which is that the cold storage rooms are too big for the plant. Another trouble, however, is carelessness in opening the doors, so that a considerable amount of warm air gets into the rooms and causes an excessive deposit of ice on the coils, so reducing the efficiency. The moisture content has also to be carefully watched. Another difficulty is that the coils such as used, for instance, in the compressors, are allowed to become dirty with oil. This lowers the efficiency because of the high resistance of the oil film to the transmission of heat. Then, again, the liquid ammonia is often not "purged" sufficiently from the air contained in it, and a further source of trouble is due either to lack of sufficient cooling water for the whole installation, or the fact that the condensers are kept in a very dirty condition, with scale deposit inside and dirt and vegetable growths on the outside.

Measuring the Velocity of Water by Means of Salt.—An interesting method which is being more and more adopted for measuring bulk supplies of water is that of the use of salt solution. The solution is injected in a known quantity into the flow of the water, and the alteration in the electrical properties of the water at two or more known points is noted. The time between the entry at one end and the arrival of the salt at various points, gives the rate of flow of the water in cubic feet per second or any other convenient unit. The salt solution is injected into the water flow by means of compressed air through a special discharge pipe system designed to give uniform distribution of the solution in the water, and the time of travel of the salt is determined as a rule by means of a special stop-watch or recording seconds watch, combined with the use of some convenient recording electrical instrument, such as an ammeter or voltmeter. The presence of the salt gives, of course, an immediate alteration in the electrical conductivity, and forms a very accurate test. The very elaborate experiments carried out in America in comparison with "V"-notch, "Weir," and "Venturi" meters have proved that this method is extremely accurate, not only for large but even for small volumes of water. It may perhaps not be generally known that this same principle has been used for a number of years in testing the accuracy of steam meters. In this method carbon dioxide gas is used, a known amount of which is injected into the steam pipe from a weighed bomb of the liquefied gas, the reduction in the weight of the bomb showing the amount of CO_2 that has been added. The CO_2 in the steam is then determined chemically lower down the pipe circuit, and it is possible in this way to obtain a most accurate record of the amount of steam passing, irrespective of the ordinary difficulties with steam meters, such as fluctuations in the pressure, temperature, and superheat.

The Trade Position.—The situation is depressing in the extreme, an ominous sign being the growth in unemployment in almost every centre. Buyers continue to purchase from hand to mouth, and stocks continue to accumulate, and at the present rate many blast-furnace and steelworks plant will not be able to hold out much longer. In July, for example, the number of furnaces closed down was 16, and others followed suit this month, whilst a significant event is the total stoppage of work at Hodbarrow Iron Ore Mines at Millom. It may be noted also that the July steel production (624,300 tons) was the lowest for this year. The political situation and the position on the Ruhr has become more uncertain than ever, and much speculation exists as to what will happen when the coke stocks are exhausted. At present the Germans have clased down the coke ovens, and the French are at the moment taking the stocks. How long these will last is a matter of opinion. Another disquieting aspect of the continued depression, not realised by the general public, is that we are continuously losing by emigration to the United States great numbers of highly-skilled mechanics and tradesmen of every description, who find work without much difficulty in spite of the bad trade in America.

The position in shipbuilding, one of the chief customers for steel in normal times, is particularly deplorable, and firms cannot carry on indefinitely working with no profit at all, or even a dead loss, merely to keep the yards partially employed. The recent report as to the affairs of the well-known Belfast firm of shipbuilders, Messrs. Workman, Clark and Co., has intensified the gloom. So far as it helps to relieve the position, the reduction in railway rates is practically useless, as it still leaves the average rate about 50 per cent. above pre-war as compared with 60 per cent. The coal trade continues much as usual, and, in general, matters are satisfactory in view of the holiday season and the fact that the boom due to the Ruhr is coming to an end.

DEATH OF DR. E. K. MUSPRATT.

A PIONEER OF SCIENTIFIC EDUCATION.

IT is with deep regret that we record the death on Saturday last of Dr. Edmund Knowles Muspratt, father of Sir Max Muspratt, the present chairman of the United Alkali Company, and son of Mr. James Muspratt, the founder of the British alkali industry. Born in 1833, the late Dr. Muspratt was for over half a century one of the leading figures not only in our heavy chemical industry but in the public life of Liverpool and West Lancashire. Notwithstanding his great age and his affliction of almost complete blindness during the last few years, his active interest in the affairs of the company of which he was Honorary President, and in all local and municipal matters was maintained to the last.

With his death the list of those of the original directors of the United Alkali Company still living is still further depleted. The late Dr. Muspratt was a personal link with the old Leblanc days of the alkali industry, and probably no one appreciated more than he the great nature of the achievement represented by the centenary celebrations recently held by the United Alkali Company. In 1850 Dr. Muspratt went to Giessen to study chemistry under Justus von Liebig, and later he worked with the same teacher at Munich. On his return home as manager of his father's works at Liverpool and Widnes he studied metallurgy at Owen's College, Manchester, but finding his knowledge prove so valuable in business, Dr. Muspratt gave up all idea of following chemistry as a profession.

He realised very strongly, however, the value of a scientific education and the urgent necessity of combining scientific research with its industrial application. He believed that education was the secret of individual and natural development. To the enthusiasm and financial aid of Muspratt a great deal of the credit for the foundation of University College, Liverpool, must be given, and to him alone must be accorded the credit for the foundation of the Physical Chemistry Laboratory at Liverpool University. Dr. Muspratt was one of the two first pro-Chancellors of the University, and was elected first president of the Council. In 1907 the University conferred upon him the honorary degree of LL.D.

Dr. Muspratt was a man of wide tastes and accomplishments. As a politician he was a thorough Liberal and Free Trader, keenly anxious to secure reform and economy in public finance. He possessed a cultured appreciation of literature, art and drama, had travelled widely in Europe and America, and in 1916 published an interesting autobiography entitled "My Life and Work."

Besides his position as Honorary President of the United Alkali Company, Dr. Muspratt remained until the last chairman of the *Liverpool Daily Post* and *Echo* Company and of British Insulated and Helsby Cables, Ltd. His death removes a great personality from the British chemical industry and from British public life, and the utmost sympathy in their bereavement will be extended to Sir Max and the other members of the Muspratt family.

A PERSONAL APPRECIATION.

(The following appreciative article on the late Dr. Muspratt's career has been specially written for the *Chemical Trade Journal and Chemical Engineer* by Dr. J. T. Conroy, chief chemist to the United Alkali Company. Dr. Conroy's long association with Dr. Muspratt renders him eminently qualified to perform such a task.)

The death of Dr. E. K. Muspratt is a source of genuine sorrow to all associated with chemical industry and with the furtherance of chemical and scientific education. To those engaged in chemical industry at home, and to consumers of chemical products throughout the world, his name carries a world of meaning, for he was a son of the James Muspratt who founded the alkali industry in this country. Dr. Edmund Knowles Muspratt was a man of many interests, and each interest had its origin in something real.

His second name, Knowles, was derived from that of his godfather, Sheridan Knowles, the dramatist, who was one of a happy party of those associated with the literary and dramatic arts, and frequently visited the parental home during Dr. Muspratt's early years. These early associations left an impression which remained throughout his life. The names of all the best of their period float across the pages of his early life, and the exceptional opportunities fortunately touched the scientific as well as the artistic side.

Dr. Muspratt's Years in Germany.

His early and adventurous career had created a wide sympathy in James Muspratt, and when the British Association met in Liverpool in 1837 a very firm friendship was established with Justus von Liebig—a friendship which was to mean much in the later years. For in these later years Dr. Muspratt, after an education in this country which comprised the then rare experience of theoretical and practical chemistry, proceeded to Giessen and studied chemistry under a man sufficiently remarkable in history, at the same time acquiring the best available teaching in the two sister sciences, physics and mathematics. Before his student days were over he turned for a period to medicine, but later resumed his study of purely chemical problems. The choice of his life's work occasioned considerable thought and anxiety. Fortunately, conditions at home largely coincided with his own inclinations, and opportunity was afforded of applying his special knowledge to industrial requirements in the Muspratt works at Widnes and Liverpool. This work was seriously undertaken, and there are many alive to-day who owe their positions either in the scientific or commercial branch to the supervision and control—not always easy—of Dr. Muspratt.

His training in Germany and the friendships it engendered introduced to this country German chemists of wide reputation, and, although these were not uniformly successful, their work and ideas proved a stimulus to others who had received the best education available at home.

His Work for Chemical Manufacture in General.

With a scientific education unusual for the period, an intense love of the arts, Dr. Muspratt was not able to contain himself within the limits which would satisfy the majority of men. He played more than an ordinary part in Parliamentary and civic affairs, and due recognition must be accorded to his valuable work with regard to chemical manufacture in general and such aspects as were best dealt with through an important Chamber of Commerce. In the record of his life we find references to problems of his period—such as escape of noxious fumes, river pollution, smoke prevention and patent laws. To all of these Dr. Muspratt made valuable contributions, and a comparison of the old difficulties and the remedies proposed and effected would prove of help in present discussions. His work towards the founding of the Society of Chemical Industry, of which he was one of the earlier presidents, is well known and need only be referred to here.

His Practical Encouragement of Scientific Education.

The writer of this memoir and many associated with him are the products of a later generation—a generation whose modern scientific training has been rendered possible by the donations of Dr. Muspratt and others to the promotion of local University education. His munificence to chemistry played no small share in insuring to this country a sufficient knowledge materially to assist in combatting an enemy to whom, scientifically, we owe much. It may be said here that the change in the character of the German people as evidenced by its official representatives was one of the surprises and the sorrows of Dr. Muspratt's later years.

His help to science can be gathered from addresses by the Professors of the Liverpool University, from Professor Dale its Principal, and from Professor Donnan, successor to Sir William Ramsay, who first occupied the Muspratt Chair of Physical Chemistry.

The Muspratt works in Liverpool, Widnes, and Flint were all-important in their day, and after their absorption in the United Alkali Company Limited Dr. Muspratt, as Chairman of the General Management Committee and later a Honorary President of the Company, was able to emphasise the lines of progress in no uncertain voice.

His tradition is ably maintained in the present and third generation, and in Sir Max Muspratt, Bart., the Chairman of the United Alkali Company Limited, and Mr. Horace Muspratt, one of the Directors, our industry possesses men of wide experience and sympathies who may be trusted to continue in the future the wise example set in the past by a giant of his day.

THE OLYMPIA ENGINEERING EXHIBITION.

CHEMICAL ENGINEERING EXHIBITS.

THERE are a good number of exhibits of chemical engineering and allied interest at the Shipping, Engineering, and Machinery Exhibition which opened at Olympia, London, on August 31, and will continue for three weeks.

Welding and Cutting Plant.

Mention may first be made of the wide range of exhibits concerning the welding and cutting of metals. The sizes of welding plants shown range from small portable sets to large plants for permanent installations. Among the improvements in acetylene welding apparatus is one embodying the automatic generation of acetylene only as it is required and in exact proportion to the consumption. In connection with these exhibits may be mentioned the Thorn and Hoddle Acetylene Co., Ltd. (London); Carbic, Ltd. (London); Allen-Liversidge, Ltd. (London); and the British Oxygen Co., Ltd. (London). The latter company now has factories in all important industrial centres of Great Britain capable of producing 4,000,000 cubic feet of oxygen per day. Recently, large engineering works have been equipped at Edmonton, on the outskirts of London, where plants for the production of oxygen, nitrogen, hydrogen, carbonic acid, argon, and others gases are manufactured. The company's extensive business in oxygen metal cutters, blow pipes, regulators, and high-pressure gas apparatus has also been transferred to the Edmonton works, but the research works are at Wembley. The development that has taken place in electric welding is testified to by the large number of exhibits (9). The Alloy Welding Processes, Ltd. (London), show a specially-designed engine-driven arc-welding plant in operation, in which the open circuit voltage of 70 drops to the pressure required across the welding arc immediately the operation commences, the available output of the machine being variable by hand from 50 to 200 amperes. Multiple welding plant is shown by the Premier Electric Welding Co., Ltd. (Proprietors: Nobel Industries, Ltd.), and a number of items on this stand are exhibited for the first time. Coated electrodes are shown by the Auto Welding and Engineering Co., Ltd. (London), and the Kjellberg system of electric arc welding is shown by the Anglo-Swedish Electric Welding Co. Other firms showing electric welding plants and apparatus are the Scholey Construction Co. (London), and Buckley, Saunders and Co., Ltd. (London). The latter specialise in electrically welding non-ferrous as well as ferrous metals, the former an admittedly more difficult problem. Several interesting specimens of electric welding work are also shown by the British Arc Welding Co., Ltd. (London), and the Quasi Arc Co., Ltd. (London). There is also the Wilson (G. D. Peters and Co., Ltd.) (London) plastic arc system of electric welding, which embodies the principle of an automatically controlled and regulated current ensuring constant voltage and a uniform heat at the weld.

Refrigerating Machinery.

Refrigerating and ice-making machinery necessarily form an important part in an exhibition mainly devoted to shipping, and thus we find CO_2 machines and ammonia compressors on several stands. Among the firms exhibiting this type of apparatus may be mentioned L. Sterne and Co., Ltd. (Glasgow); the J. D. Insulating and Refrigerating Co., Ltd. (Liverpool), who show a complete cold store insulated on the J. D. patent unit system of insulation; John Kirkaldy, Ltd. (London) and Ernest West and Benyon, Ltd. (London).

Messrs. Thomas and Bishop (London) show examples of Permac jointing material in test tubes containing sulphuric acid, naphtha, benzol, ammonia, hydrochloric acid and caustic soda to prove that no disintegration takes place when Permac is used as a jointing material on plant where any of these acids or chemicals are used.

Boiler Apparatus and Measuring Instruments.

Boiler apparatus and measuring instruments are quite numerous. The Lea Recorder Co., Ltd. (Manchester) have many of their well known instruments including boiler feed measuring apparatus, having a capacity of 30,000 gallons per hour, arranged in a self-contained manner with combined V-notch measuring tank and hot well. The Cambridge and Paul Instrument Co., Ltd. (London) have a range of their universally-known instruments for boiler-house purposes, including electrical CO_2 recorders and indicators, draught and pressure gauges and apparatus for the measurement and control of temperature. George Kent, Ltd. (London) show in operation an interesting piece of apparatus in the form of two Venturi meter tubes and two recording instruments, one of them being the 1922 type specially designed to measure condensate and feed water of a pulsating nature in a closed circuit. Another interesting apparatus on this stand is an audible water level recorder. Indicating and recording instruments for works and boiler-house control are exhibited by Messrs. Walker, Crossweller and Co. (London). Of particular interest are their gas analysis recorders.

Water-softening and Purification Exhibits.

Interest attaches also to the water-softening and purification exhibits. W. Boby and Son (London) have introduced recently a type of water softener termed the "Azed." This is an artificial-zeolite machine which is claimed to achieve an appreciable economy in salt as compared with the older forms of zeolite machines. There are also examples of this firm's lime and soda plants, one form embodying devices for varying the proportions of reagents whilst the machine is in operation, whilst in a second type the reagents are distributed to the water in the form of powder, and the plant is thus specially suited for smaller requirements and intermittent working. A representative exhibit of Lassen-Hjort and Permutit water-softening and purifying plant is to be seen on the stand of United Water Softeners, Ltd. (London). The former plant, shown in operation on London water supply, softens the water from an initial hardness of 22 degrees Clark to 2 degrees, with a residual alkalinity of under 1½ grains per gallon, expressed as carbonate of lime. This plant embodies a recently designed measuring and mixing apparatus, fitted with patent locking gear and positive chemical discharge valve, ensuring the delivery of any required dose of chemicals to a measured quantity of water. The whole process, from the mixing of the chemicals to the delivery of softened and filtered water is open to inspection at the Exhibition. The Permutit system of water softening is well known, and the Wallace-Tiernan automatic chlorinator for adding chlorine gas in minutely measured and absolutely controlled amount to water supplies or sewage effluents is shown in two types.

Improvements in the Hele-Shaw Stream Line Filter.

There is a whole series of filters and separators on view, probably the most interesting, by reason of its ingenuity and novelty being the Hele-Shaw stream line filter. This apparatus has already been described briefly in the *Chemical Trade Journal and Chemical Engineer* on the occasion of the lecture by Dr. Hele-Shaw before the Society of Chemical Industry last session. The filter is now being marketed in its more commercial forms. There are some laboratory types of the filter on view, others of a small commercial type representing a capacity of 200 gallons an hour and one larger filter capable of dealing with 50 tons of water an hour. Since the filter was described before the Society of Chemical Industry an entirely new device by which the difficult problem of automatically clearing out the solid residues deposited in the filter without opening the filter has been solved. In each of the larger tunnels formed by the holes in the compressed paper sheets is a free floating piston, which normally lies in a pocket in the end covers. When it becomes advisable, owing to a falling off in the flow, to remove the residuum from the filter, the liquid prefilt under pressure is admitted behind the piston, which then traverses the length of the pack of compressed papers and drives the solid matter choking the holes, before it. This simple method provides a practically continuously acting filter; for the cleaning cycle takes only a few seconds.

Centrifugal Separators and Extractors.

British Separators Ltd., show separators manufactured by Messrs. Vickers, Ltd., designed for three main purposes—viz., the continuous separation of two liquids of different specific gravities; the continuous separation of two liquids of different specific gravities together with the simultaneous removal of fine solids; and the removal of fine solids from a single liquid. There are obviously many applications for this type of apparatus in chemical works generally. These machines are British and have been designed specially to compete with the imported article. The process is centrifugal. The actual separating effect however, depends not only on the accentuation of gravity by the speed of rotation, but also on the internal arrangements of the bowl. It is in this latter respect that special features are claimed for their separators,

it being possible to arrange the bowl as a purifier and as a super-clarifier. These machines go by the name of the Vickeen, and many applications of them can readily be imagined.

There is also the new Auto-Klean system of straining for fuel oils, lubricating oils, water, etc., in which all the disadvantages of gauze and perforated metal are eliminated. This is exhibited by Auto-Klean Strainers, Ltd. (London) and is claimed to be an entirely new departure in straining appliances.

Messrs. R. C. Knight and Dunford Smith (London) have on view the Condrup patent oil separator. This is an apparatus which has been designed to meet the requirements of the Oil in Navigable Waters Act and so operates that the oil in bilge water, for instance, is pumped through the separator by existing pumps, the oil being recovered and the water led overboard. In the same category comes the comprehensive exhibit of Industrial Waste Eliminators, Ltd. (London), which includes the "Iwel" steam turbine centrifugal separators and extractors for the recovery of oil, grease, fat, wax, etc., from innumerable classes of material. In this case, of course, the material dealt with is of a solid character, and to that extent the apparatus is different from those previously mentioned.

Miscellaneous Exhibits.

There are a few exhibits of various types of paints, varnishes, and anti-corrosive compounds, among which may be mentioned the following:—Cuirass Products, Ltd. (London), exhibitors of anti-corrosive paints; the Midland Fan Co., Ltd. (Birmingham), plants for spraying paints; Dodgson, White, Ltd. (London), "Service" black paint for use in the tropics and at home, and claimed to be acid proof, alkali proof, and a complete insulator; Arthur Hotchkiss and Co., Ltd. (London), "steel" paint and compositions. Nobel Industries, Ltd., have a comprehensive display of numerous products made at their different factories, including explosives such as are used for mining, blasting work, and civil engineering. The special display of Necol Plastic Wood, which has already made many friends amongst engineers, patternmakers, and others who require a quick and reliable method of filling holes and making fillets on woodwork, is a feature of the Nobel Stand, while the new Collodion Glossy Enamels for spraying metal and woodwork are an interesting development and likely to go a long way.

The Chemical Engineering Co., Ltd. (Manchester), are exhibiting the "Kek" automatic crusher and worm feeder, magnetic separators, and the "Kek" patent centrifugal grinding and blending mill. The Porter water softener is also shown by this firm, a mixture of milk of lime and soda ash being used as the reagent.

An interesting electro-metallurgical process is that shown by Metallisation, Ltd., which consists in the melting and atomising of the coating metal or alloy, which is in wire form, and impinging it as a fine spray on the surface to be coated. The spraying is done by a "pistol," which weighs less than 3¼lb., and is connected to suitable gas and air supplies. The metal is automatically drawn from a reel into the pistol case, and fed uniformly and continuously, according to its melting rate, into the nozzle, where, entering a continuous reducing flame zone, it is melted and blown at a very high velocity in the form of a fine spray or mist, on to the work to be coated.

LEGAL INTELLIGENCE.

A CASEIN COMPANY'S FAILURE.

British Casein Company (1911), Ltd.

The statutory meeting of creditors was held on Wednesday, under the liquidation of this company of 24, Great Dover Street, S.E. The winding-up order was made on May 15 last on the petition of Mander Bros., paint and varnish manufacturers, of Wolverhampton. The company was incorporated in February, 1911, with a nominal capital of £2,100, to acquire and carry on the business previously carried on by the British Casein Co., Ltd., manufacturers of and dealers in casein and milk products. The new company was principally engaged as merchants in placing casein and milk products on the market, and to some extent they bought the raw material and treated it by a chemical process. At first the business was profitable and dividends were paid until 1917. Since the end of 1918 a Mr. Nacouwehand had been the sole director, and although no profits were earned in 1919 and 1920, he said that the business gradually decreased owing to lack of working capital. The deficiency account showed a gross profit on trading from January 1, 1921, to the date of the winding-up order of £2,038., but that was insufficient to meet the overhead charges which amounted to £4,200. The nett loss on trading during that period was £2,017. The statement of affairs showed liabilities of £1,817, of which £1,509. was due to trade creditors. The assets were returned at £945. The Official Receiver stated that he had received a letter from a gentleman intimating that the company was indebted to him for £992. That claim was put into the statement of affairs as a contingent liability and not expected to rank against the estate for dividend, but evidently it would have to be added to the unsecured debts. The claim was in respect of 417 boxes of casein delivered after the winding-up order was made and sold by a firm of agents on behalf of the company.

Eventually the matter was left with the Official Receiver as liquidator.

CORRESPONDENCE.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

UNEMPLOYMENT AMONG CHEMISTS.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—While it is true that at present there is considerable unemployment in the profession of chemists, it is also true that there is as large, if not a larger, percentage of unemployment in the other professions; in fact, in every sphere of life. In the profession of chemistry, like all other professions, there is plenty of room—at the top. The first question for the embryo chemist to consider is, Does he like chemistry? And the second, Has he an aptitude for it? If the answers to both these questions are in the affirmative, let him, for preference, enter for an honours course in chemistry in one of our Universities. If either of them is answered in the negative, then let him do something else.

It is also true that the ranks of the profession have been largely augmented during the last few years. This, however, is an aftermath of the war, and is now at an end, ex-Service men having chosen to enter the profession in such large numbers that it taxed the schools of chemistry to their utmost. And in spite of the general depression in trade, it is remarkable that so many of these men have secured satisfactory appointments. In this department alone 15 men took the Degree of B.Sc. in Colour Chemistry in 1921, and 31 did likewise in 1922. All of these men are in satisfactory positions. Of this year's graduates it is too soon to speak, but several of them have already secured posts. These are hard facts. I am sure the other chemical departments in this and other Universities have similar reports to make. These figures lead to but one conclusion—namely, that there are a great many more openings for chemists now than there were in pre-war days. From personal knowledge I could mention several firms who, before the war, employed perhaps one or two chemists, but who now have their own research, technical, and analytical staffs.—Yours, etc.,

Colour Chemistry Department, R. B. Forster.
Leeds University. September 4, 1923.

CHEMICAL WORKERS' STRIKE.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—With reference to the paragraph in your issue of August 31, page 254, re the chemical workers' strike at Falkirk, I should like to make it clear that although we are the only Union known definitely as the "Chemical Workers' Union," the workers in dispute are not members of this Union, and neither are our officials conducting negotiations.—Yours, etc.,

Arthur Barrett.
(London District Secretary, National Drug and Chemical Union).

September 1, 1923.

ITEMS OF INTEREST.

Chromium Electro-Plating.—It is announced that R. Grah Successors, Ltd., of Sheffield, have perfected the process of plating with pure chromium. The resulting surface is claimed to be absolutely rustless and untarnishable.

Nickel Ore in Spitzbergen.—The expedition to Spitzbergen, organised by the Northern Exploration Company, reports the discovery of nickel ore—the first find of its kind—on Spitzbergen.

Zinc Production in Tasmania.—The Hobart zinc works continue to make good progress. Statistics for the March quarter show that the production for the period was 8,163 tons, valued at £244,890., an increase on the corresponding quarter last year of 5,278 tons and £167,762.

Mint to Make More Coppers.—As a result of extensive alterations planned to be carried out at the Royal Mint, the output of copper coins will be increased. New furnaces and stamping machinery are to be installed in the bronze coin department.

Aluminium Propaganda in Germany.—In order to encourage the use of vessels and plant made of aluminium in Germany, the Metallwirtschaftsbund with the approval of the Government has opened an Information Bureau at 12, Victoriastrasse, Berlin, W. 10. The functions of this Bureau will be purely advisory.

New Internal-Combustion Engine Device.—The development of a satisfactory mechanical device for automatically starting and stopping internal-combustion engines has been announced by Mr. E. Campbell Maccormac, of Daniel Adamson and Co., Ltd., Dukinfield, near Manchester. Further details of this interesting invention will be published at a later date.

New Waterproof Glue.—A highly water-resistant blood albumen glue which can be applied without the use of a hot press has been invented by A. C. Lindauer of the Forest Products Laboratory, U.S. Forest Service. The development of this glue is the latest and most promising advance made as a result of the long-continued search by the Government laboratory for a satisfactory waterproof glue for wood.

Time Recorders and Costing Systems.—At the Olympia Engineering Exhibition, the firm of Gledhill-Brook Time Recorders, Ltd., of Huddersfield, are exhibiting a complete range of time recorders and job-costing systems. These systems work in the simplest possible manner in actual practice. Particularly interesting amongst this firm's exhibits are two new models of portable time recorders not shown hitherto.

British Association.—In connection with the forthcoming meeting to be held in Liverpool, it has been decided by the University of Liverpool to confer the honorary degree of doctor of science upon Sir Ernest Rutherford, president of the Association; Mr E H Griffiths, treasurer; Professor J. C. McLennan; Professor Niels Bohr; Professor G. N. Lewis; and Dr. Johannes Schmidt. The ceremony will take place at 2.15 p.m. on Monday, September 17, at the University.

Business Notice.—Messrs. Robinson Brothers, Ltd., have, after a period of close association with Messrs. Lewis Demuth and Co., Ltd., effected an amalgamation of their respective tar-distilling interests in the Midlands, under the name of "The Midland Tar Distillers, Ltd." All the directors of Robinson Brothers, Ltd., join the board of the Midland Tar Distillers, Ltd., and the business of what will henceforth be known as the Robinson Brothers Branch will be carried on as hitherto.

Japanese Camphor Trade.—Exports of camphor from Japan advanced from 10,000 piculs in 1920 to 14,000 in 1921, 36,000 in 1922, and 14,000 for the first three months of 1923. America is by far the biggest purchaser from Japan, but both India and Germany have re-entered the market as buyers on a large scale. In Formosa, business during 1922 showed a vast improvement. Exports of camphor oil and camphor combined totalled 10,208,390lb., while those of camphor alone amounted to 5,089,817lb., of which nearly one-half went to the U.S.A., one-third to Japan, and the remainder to the United Kingdom and France. The total export in 1921 only amounted to a trifle over one million pounds.

British Coal Output.—The output of coal at the mines of Great Britain for the week ending August 25 was 5,163,800 tons, as against 5,124,000 tons in the previous week, and 5,148,000 tons in the corresponding week of last year.

Coal Strike in United States.—A Reuter message from New York, dated September 2, states that 158,000 anthracite miners have ceased work, although the negotiations endeavouring to bring about agreement in the wages and other disputes are still continuing.

Japanese Employees of Brunner, Mond's.—It is reported that the European staff of Brunner, Mond and Co., Ltd.'s Yokohama office in Japan—W. R. Devin and R. H. Chalinor, —with their wives and families, are safe. It is feared, however, that the native staff have perished.

Ether Explosion in Edinburgh.—An explosion took place in the ether making plant of Duncan, Flockhart and Co., manufacturing chemists, Holyrood Road, Edinburgh, on Friday last week. Two men, William Walker, and Craig Ferguson, were engaged cleaning the plant, when, owing, it is believed, to the fusing of an electric wire and the emission of a spark, the explosion occurred. Part of the plant was destroyed.

Birmingham Technical Schools.—The evening classes at the Birmingham Municipal Technical Schools include this session special classes in paint, varnish, and rubber technology, and gas supply and gas-engineering chemistry. Examinations for the National Certificate of the Institute of Chemistry and the Institute of Gas Engineers have been instituted by the Board of Education in conjunction with the respective Institutes. In the Metallurgical Department there is a special course of lectures dealing with fuel and refractories.

Borax Prices Reduced.—As from September 1, prices of "twenty mule team" brand borax and boric acid are reduced by £2. per ton, and borax glass by £4. per ton. Borax Consolidated, Ltd., state that prices, c.i.f. foreign ports, will be quoted on application.—C. Christopherson and Co., agents for "Three Elephant" brand borax, state that prices have been reduced by £2. per ton as from September 1. Prices of imported material, therefore, are still £1. per ton lower than the British-produced borax.

Suggested Hall Mark for Platinum.—There is a demand among manufacturers for a hall mark for platinum in this country. This already obtains in France and Switzerland. It is pointed out that in this country there is a hall mark for gold which costs £3. 10s. per ounce; while platinum, which costs £25. 10s. per ounce, bears no guarantee mark beyond the word "platinum," many articles bearing this which sometimes contain less than 75 per cent. of platinum. A hall mark, it is suggested, is necessary for the protection of the public.

Salford Technical College Chemical Society.—It is stated that the Chemical Society of the Salford Technical College was instituted in the year 1909, and is open to all persons interested. During the war period, however, the activities of the Society were interrupted until, in September, 1922, one or two members of the staff of the chemistry department of the College renewed them with excellent results. It has now been decided to open up the membership to all who desire to join. An excellent syllabus has been arranged for 1923-24. The Society meets on the last Friday evening in each month at 7.15 p.m. in the College.

Nitric Acid Formation in Carbon-Dioxide Manufacture.—In manufacturing carbon dioxide by combustion of coke with subsequent absorption of the evolved gases in potassium carbonate solution from which the carbon dioxide is obtained by heating the bi-carbonate so formed, it was observed, state L. Hackspill and A. Couder (*Comptes rend.*, 1923, 176, 1811), that the lower part of a condenser which collected a small quantity of escaping water vapour was subject to rapid corrosion. Investigation showed that iron nitrate was present in the corroded material, moreover a quantity of potassium nitrite was found in the potassium carbonate solution. This was traced to oxidation of the nitrogen of the coke on combustion, from 0.55 to 4.1 milligrammes of nitrite being produced per g. of coke consumed. A part of the nitrous acid was liberated by the action of carbonic acid and underwent further oxidation in the presence of air and moisture to nitric acid, the latter substance being the cause of injury to the plant.—*J.S.C.I.*

Australian Mineral Deposits.—A valuable find of silver and lead ore has been discovered 26 miles north of Chillagoe. Mr. Godard, general manager of Chillagoe State Smelting Works, asserts that it promises to be the most important silver and lead find in Australia. Ten samples average 50 to 70 ounces of silver per ton, and 50 per cent. of lead with pure galena. Three private leases have been granted, and the Government has also secured an area.

Saar Coal Production.—Figures have been published showing the production of the mines of the Saar basin under French exploitation. Since French control began, on January 18, 1920, the net production has been 9,198,714 tons in 1920; 9,336,493 tons in 1921; and 10,943,311 tons in 1922. The total net production in 1913 was 12,875,140 tons, and in 1919, the last year of German control, the total was 8,758,356 tons. The daily output in 1922 was 37,058 tons, as compared with 42,803 tons in 1913 and 30,306 tons in 1919.

Tariff Notes.—The removal is announced of the Customs duty on the importation of methylated spirits into Southern Rhodesia.—Duties on the following articles imported into New Caledonia and Dependencies are modified as from August 5: castor oil, cottonseed oil, resin, tar, turpentine, calcium carbide, oxygenated water, sulphuric acid, gas mantles, and dynamite.—The former duties on perfumery and toilet articles imported into San Salvador are reduced to 40 centavos (gold) per kilog.

Petrol-Water Mixtures.—Professor A. M. Low, writing in the current issue of the *Motor*, states that he has prepared stable emulsions of petrol and water, containing about 7.5 per cent. of water, which have proved very serviceable fuels for internal-combustion engines. The permanence of the emulsion is secured by the addition of small amounts of a protective colloid. The emulsion is translucent, causes no trouble with carburation, and the water content prevents carbon deposit, reduces knocking, and increases the efficiency of the engine.

Tasmanian Carbide.—Owing to the dumping of foreign carbide, the Tasmanian carbide works have been closed for many months, and the directors of the company have continued their endeavours to get the Federal Government to reimpose the embargo. The company was regaining its feet after experiencing an almost unprecedented series of difficulties when the embargo was lifted, and was again compelled to close the works, throwing 300 hands out of employment. The Federal Government has since notified that the embargo on importations will not be reimposed, but the Industries Preservation Act will be applied. With this assurance production has been resumed.

Canada's Mineral Production.—The High Commissioner for Canada in London has just received from the Dominion Bureau of Statistics at Ottawa, revised statistics dated July 30, on the production of zinc, lead, and asbestos in Canada. The production of zinc in the refined state during 1922 amounted to 28,145 tons, valued at 3,217,536 dollars. In 1921 the production was 26,544.6 tons, valued at 2,471,310 dollars. The production of lead during 1922 amounted to 46,653.58 tons, which was valued at 5,817,702 dollars, as against 33,339.8 tons, valued at 3,828,742 dollars in 1921. The total quantity of asbestos rock mined during 1922 amounted to 2,562,933 tons. Of this, 2,166,385 tons, or 84.5 per cent., was milled, and 158,023 tons of asbestos was recovered in a marketable state. The sales for the year amounted to 163,706 tons, for which the producers received 5,552,723 dollars.

U.S. Cement Position.—While the stocks of Portland cement in America have shown a steady decline during recent months, the production, on the other hand, continues well above the level of the previous year. According to statistics recently compiled by the United States Geological Survey, stocks on hand at the end of July amounted to 8,076,000 barrels, showing a decrease of no less than 1,092,000 barrels in comparison with the previous month's total. The output of cement in July totalled 12,620,000 barrels, which, compared with the previous month, shows an increase of 238,000 barrels. For the first seven months of 1923 the output reached a level of 74,940,000 barrels, comparing with only 58,475,000 barrels for the corresponding period of last year. As regards shipments, there were about 13,712,000 barrels exported in July, which compares with the record of 14,257,000 barrels in May and 13,850,000 barrels in July, 1922. Shipments since January 1 to date show a gain of nearly 14,100,000 barrels, the total being 75,938,000 barrels.

Manchester's New Metallurgical Laboratories. — The formal opening by Sir George T. Beilby of the new bay of the Department of Metallurgy of the University of Manchester will take place on Tuesday, September 11. In a brief account of the history and development of the Department, which has just been issued, it is stated that the new buildings will provide accommodation for advanced teaching and research for thirty to thirty-five students and some eight or ten research men. A Departmental library has been started, to which Sir Christopher Needham has made a valuable contribution, but further gifts are urgently needed.

Aluminium Paint and Heat Radiation.—The aluminium or bronze paint generally applied to radiators greatly reduces their effectiveness, and makes it necessary to have a larger surface for the same heating effect, according to experiments performed by Dr. W. W. Coblentz of the U.S. Bureau of Standards. Dr. Coblentz finds that the heat radiated from an aluminium painted radiator surface is less than a third of that emitted by a radiator of the same size painted with a non-metallic paint, enamelled, or simply allowed to rust. On the other hand, he finds that aluminium paint is a very effective means of reducing the amount of heat transmitted through a thin material.

Lead Azide in Explosives.—Lead azide, nitride, or hydronitride has been used for a comparatively short time as an initiating agent in the manufacture of explosives, and has replaced mercury fulminate to some extent, according to C. A. Taylor and William H. Rinkenbach, explosives chemists of the Department of the Interior, who have made a study of the subject at the Pittsburgh experiment station of the U.S. Bureau of Mines. Many accidents in manufacture have, however, been attributed to its use. Lead azide is comparatively safe in a state of fine division, but its large crystals are extremely dangerous. It contains more nitrogen than fulminate, and is a better initiator, though it is less sensitive to blows and percussion.—*Colliery Guardian.*

COMING EVENTS.

Institute of Metals. — Annual meeting, **September 10-13,** at Manchester. Second annual autumn lecture: "The Use of Non-ferrous Metals in Engineering," by Lieut.-Col. Sir Henry Fowler, **September 10,** at **8 p.m.,** in the Milton Hall, Deansgate.

British Association. — Annual meeting, **September 12-19,** at Liverpool. Presidential address, "The Electrical Structure of Matter," by Sir E. Rutherford. In Section B. (Chemistry) the following papers are to be read: "The Formation of Precipitates," by S. Oden; "The Nature and Significance of the Resin of Hevea Rubber," by G. S. Whitby; "The Physical Chemistry of Interfaces," by Professor F. G. Donnan, F.R.S.; "The Quantum Theory in Chemistry," by Professor G. N. Lewis; "The Bohr Atom and the Periodic Law," by Dr. N. V. Sidgwick, F.R.S.; "On High Frequency Spectra and the Theory of Atomic Structure," by Dr. D. Coster; "The Activation of Hydrogen in Organic Compounds," by Miss E. H. Usherwood; "Membrane Potentials considered as Diffusion Potentials," by Dr. E. B. R. Prideaux; "Enzymes," by Dr. E. F. Armstrong, F.R.S. "The Relation of Certain Enzyme Actions to Tissue Differentiation and Tumour Growth," by Dr. K. G. Falk; "Catalytic Actions in the System Copper, Copper-Oxide, Oxygen, and Gaseous Reducing Agent," by W. G. Palmer; "Alumosilicates," by W. Vernadsky; "The Chemistry of Hafnium," by Dr. G. Hevesy; "The Utilisation of Volcanic Steam," by Senatore Prince Ginori Conti; "The Biochemical Effect of Polarised Light," by Miss E. S. Semmens; "Cotton Wax," by Dr. R. G. Fargher; "The Absorption of Methylene Blue by Cotton," by D. A. Glibbens; "The Sulphonation and Nitration of Naphthalene," by Professor H. E. Fierz. There is also to be a discussion with the Mathematics and Engineering Sections on "Cohesion and Molecular Force."

Institution of the Rubber Industry.—Meeting, **Monday, September 17,** at **8 p.m.,** at the Engineers' Club, Coventry Street, London, W. Paper: "Rubber Floors and Rubber Roadways," by E. J. Edwards.

Iron and Steel Institute.—Autumn meeting, **Monday** and **Tuesday, September 17** and **18,** at Milan.

Ceylon Imports of Calcium Carbide.—Total Ceylon imports of calcium carbide for the year 1922 amounted to 946 cwt., valued at 17,956 rupees Norway leads the list with more than half—561 hundredweight, valued at 10,795 rupees Switzerland, Sweden, Belgium, Austria, and Denmark are the only other mentioned suppliers of this product, the quantity and value of imports from these countries being as follows: Switzerland, 100cwt., valued at 1,864 rupees; Sweden, 78cwt. at 1,483 rupees; Belgium, 40cwt. at 720 rupees; Austria, 20cwt. at 343 rupees; Denmark, 20cwt. at 375 rupees; and other countries, 127cwt. at 2,341 rupees.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

The trade barometer is still set at change, with a tendency to unsettled conditions. A rather less hopeful view is taken this week of the aspects of affairs in the hematite pig-iron trade, and since it is the furnaces in West Cumberland and the Furness district that mostly use the local coke, the course of events must necessarily be watched with some anxiety. If business is no fuller than it has been this week, the number of furnaces in operation cannot be maintained, and unless some improvement takes place, the iron trade here will not be able to absorb as large a part of the make of coke as it is doing at the moment. What is a very important consideration to coke makers and indeed to coal owners is the fact that no headway is being made in the steel trade. One week's work out of four at the steelworks at Workington is the utmost than can be hoped for in the present circumstances, and Barrow, it is to be noted, is rolling a smaller tonnage of steel than was the case a few months ago. If these steelworks were only partially engaged coke makers would have a fair guarantee that their ovens would be kept in full swing. The depressed condition of the iron and steel industries is not of course without its adverse influence on the coal trade, and it would appear that the demand for coal may fall to a lower ebb directly the settlement of the Whitehaven dispute, which is due any day now, may give an upward lift to production in the coalfield. It is taking the collieries all their time even now to market their round coal. It is only the smalls that can command a good market. All that there is to record is that the make of coke is being fully absorbed, the furnaces here taking the greater part of it at 29s. to 33s. per ton according to carbon content, while what remains is quickly sold to Continental consumers at 33s. to 37s. per ton, f.o.b. No falling-off in Continental demand is apprehended, and it is stated that deliveries may be larger towards the end of the year. Residuals are a fairly satisfactory trade. The make of crude benzol and sulphate of ammonia is being absorbed. Most of the chemical products are in fair demand. Creosote is a sharp trade. Road tar, however, is dull. East Coast coke supplies are 8,200 tons this week.

SOUTH WALES NOTES.

[Specially Contributed.]

Good business is being transacted in tinplates, chiefly for immediate wants. Merchants are more inclined to place orders for extended periods, and some of the factories have sufficient orders on the books to last until close of the year. The patent fuel trade is slightly better, for although foreign orders have slackened somewhat, the home requirements have increased. The exports for last month exceeded 50,000 tons from the South Wales ports. The chief markets at present are Brazil, French West Africa, Algeria and France. The coke ovens are fully operating and exports of cokes are increasing. Some 12,000 tons left the Welsh ports during the last four weeks, mostly to Germany and Spain. By-products are in good call, with the exception of sulphate of ammonia, which keeps rather neglected. There is only a moderate demand and supplies are plentiful. Basic slag is in fair request and there is no difficulty in executing orders; but trade in fertilisers generally is not very good. Some trouble with the spelter workers is reported, but it is hoped that any serious dispute will be averted. The steel smelters have, on their own initiative and without the consent of their Union officials, decided to give 28 days notice to cease work if a settlement is not arrived at.

Among the week's imports were 706cwt. phosphorus from Montreal, and 41 tons ferro silicon from Antwerp to Newport; 9,741 tons zinc concentrates from Port Pirie, 265 tons copper ore from Besra, 38 tons precipitate of copper, and 70 tons calcium carbide from Hamburg to Swansea; 21 barrels red arsenic, and 43 barrels white arsenic from Antwerp, 4,150 tons iron ore from Mantella, 200 tons cement to Cardiff. The exports included 4 tons sheep dip, 7 tons pitch and tar, 11 tons painters' colours from Newport to Buenos Ayres.

FERTILISER NEWS.

Nitrate of Soda.—Examination of the preliminary statistics of the nitrate industry for August shows that production appears to be falling off. Since the beginning of the year a number of oficinas have reopened, until at the present time upwards of 70 plants are in operation. Production, which in January amounted to about 132,000 tons, steadily increased until in June the figure reached about 166,000 tons. The rectified total for July was 157,000 tons, and now the output for last month is estimated at 148,000 tons only. Subsequent information may lead to this figure being considerably modified; yet, even so, it is evident that the tendency is downward. This is a serious matter, and should engage the attention of those optimistic writers in the daily Press whose expressions of opinion during the past few days have been rather more numerous than of late. The comparatively large figure of European imports, and the continued reduction of stocks on the West Coast of Chile, have generally been taken to mean that the industry is at last on its feet, and that the patient nitrate investor is at last to be rewarded Unfortunately, there is much which contradicts, or at any rate modifies, this view. Apart from the slowing-down of production, sales by the Producers' Association have continued woefully small at 12,000 tons for the whole of August. The cheapest official nitrate now available is at the 20s. 7d. per quintal rate, delivery over second half of November. It is true that Continental conditions are very unfavourable in so far as estimating probable consumption over next season is concerned, and it is probable that many importers regret their hasty orders given at the time of the publication of the new prices. Already a fair amount of resale nitrate has been bought at slightly below the Association's price, which indicates a certain uneasiness on the part of importers. The large import figure, given at 126,500 tons for Europe and Egypt, compares with 22,600 tons for August last year, and 15,700 tons in 1921. Deliveries from ports amount to 53,000 tons, leaving European stocks at about 144,500 tons on August 31, against 71,000 tons on the 1st of the month. Owing to the reduction in freight charges, values of present arrivals have fallen to the level of £11. 6s. per ton, c.i.f. This being the case, it would seem that some reduction in the present prices in this country, which range about £13. 7s. 6d. per ton, would be not only desirable, but a necessity.

Sulphate of Ammonia.—The outlook for this fertiliser presents some interesting features, one of the most novel being the decision of the German manufacturers to cease quoting on a mark basis. In endeavouring to keep pace with the constantly depreciating currency, unit values in sulphate of ammonia were finally quoted at ridiculous figures, entirely useless outside Germany, and of very little value in that country itself. It is therefore of great significance that this fact has at last been realised, and prices are now based on the value of a food product, rye, in the proportion of 100kilogs. of sulphate of ammonia to 140kilogs. of rye. The strike of anthracite miners in the United States appears to have commenced—some 150,000 men are reported to have ceased work,—but negotiations are still proceeding, and it is hoped that even yet a settlement may be arrived at. It will be remembered that prominent fertiliser manufacturers have attributed the sulphate shortage in that country not to the great coal strike, but to the dislocation of transport caused by the railway stoppage, and it is therefore possible that, should the anthracite miners' strike assume large proportions, the sulphate industry will again be adversely affected. Prices remain very high, with no export trade beyond the contracts fixed by the great steel corporation, which markets its own product. Merchants consequently are only able to do business in the domestic market, foreign importers being unwilling to pay the figure demanded when they can obtain the British product at a much lower figure. It is stated that English sulphate is selling in Cuba, hitherto supplied almost entirely by the States. With the slowing-down in the British iron and steel industry, however, and the reduction in the number of blast furnaces operating, it is very probable that the output of sulphate in this country will decline during the coming months. It has been said that one result of the great earthquake disaster in Japan will be a heavy call in this country for steel products, but such a demand could undoubtedly be met from stocks. In view of the promise of shorter supplies for the coming season, it would appear to be the best policy for dealers and consumers to make every effort to estimate requirements and place their orders with the least possible delay. Prices over September, as fixed by the Sulphate of Ammonia Federation, are for the neutral quality showing 25¾ per cent., £14. 10s. per ton for 4-ton lots, delivered. Limited supplies of ordinary quality of 25¼ per cent. ammonia are available at 23s. per ton less than this figure. These prices are for home consumption only, and the Federation's penalty clause for infringement of this provision still holds good.

Russian Phosphate Deposits.—According to Professor Pranishnikov, of the University of Moscow, it is estimated that European Russia has 5,563 million tons of phosphate reserves, of which 141 million tons show a phosphate content of over 24 per cent. The possibility of exploiting these deposits has been discussed by the professor while in Berlin recently, but the lack of capital and technical experience in Russia has prevented any such action up to the present time. Representations have therefore been made to Germany to assist in the formation of a superphosphate industry in Russia, by erecting chemical plants near the deposits to be operated by the Germans themselves. It is pointed out that although Germany has developed a considerable nitrogen industry, and is favourably situated with regard to potash supplies, it is suffering and has suffered since the outbreak of the war, from an acute shortage of phosphates. The former import trade with Tunis, Algeria, Florida and the South Sea Islands is at present seriously hindered on account of the present economic conditions, and inability to purchase in high-exchange currency. In Russia also, despite the possession of enormous phosphate deposits, there is a shortage of the material for agricultural application. The most promising deposit is situated in the province of Viatka, along the upper stretches of the river Kama, a tributary of the Volga. The raw material has been found to contain from 26 to 29 per cent. of phosphorus, while the average yield of the deposits is from 400 to 500 kilogrammes per square metre. The Government, it is stated, have already built a dock on the Kama in view of the possible exploitation. Sulphuric acid to be used in the manufacture of the fertiliser is to be obtained from the pyrites mines in the Ural. The Professor therefore thinks that the best method of dealing with the matter would be for Germany to procure a concession in the Kama district, and there manufacture superphosphate and other phosphoric products. This, he states, would be a step forward in correcting the phosphate shortage from which both Germany and Russia are now suffering

American Cyanamid Company's Report. — The report of the American Cyanamid Company, which is the largest producer of cyanamid and cyanide in the United States, shows that remarkably good results were obtained for the year to June 30 last, due to the recovery of the fertiliser and mining industries in that country. Total income, including profits from subsidiaries, was 2,010,000 dollars, after providing for depreciation and taxation, which compares with 198,000 dollars and 344,100 dollars for each of the two preceding years respectively. Dividends on the preferred shares absorb 335,800 dollars, and a sum of 950,000 dollars has been set aside to provide for contingencies arising out of suits brought by the United States Government for taxes, and other suits pending against the company. Moreover, goodwill, which a year ago stood at 2,216,800 dollars, has been written off, but this reduces the surplus at credit of profit-and-loss from 3,143,300 dollars to 1,496,400 dollars

NEW COMPANIES.

Reids Ovalba, Ltd.—Private company. Capital £2,000. Manufacturers of and dealers in boot dressings and cleaning preparations. Office: 6, New Compton Street, London, W. 1.

United Fertiliser Company, Ltd.—Private company. Capital £2,100., in 2,000 ordinary shares of £1. and 2,000 founders' shares of 1s. Manufacturers of, dealers in, and importers and exporters of fertilisers, etc. Director: C. H. Cook, Little Stone Stile, Selling, near Faversham.

LIMITED PARTNERSHIP.

Self-lighting Gas Mantle Company.—Importers and manufacturers of self-lighting gas mantles and materials for treating the some, 14, New Bridge Street, London, E.C. Partnership for ten years from July 17, 1923. General partners: C. Fenton and E. T. Smith. Limited partner: J. S. Holland, contributing £500. in cash.

REPORTS OF COMPANIES.

American Cyanamid Company.

Accounts for year to June 30 last show net sales, $8,582,678; operating charges, $6,380,462; net profit, $2,201,616; miscellaneous income (less miscellaneous charges), $171,597; total, $2,373,213. Reserved for income-taxes, $261,149; patents and licences, proportion written off, $233,975—$495,124; net income of American Cyanamid Co., $1,878,089); net profits of subsidiaries, $131,867; net combined income, $2,009,956. Report adds that during year goodwill, amounting to $2,216,804, which had been carried as an asset on company's books, was written off out of surplus. Claim of Government for additional taxes, referred to in last year's report, remains undetermined. In addition to this there are other claims pending against company growing out of contracts made by Amalgamated Phosphate Co. Without admitting any liability whatever for any of these claims, directors felt that as a matter of business prudence there should be transferred from surplus as a credit to "reserve for contingencies" the sum of $950,000, and this has accordingly been done.

Peachey Leather Products, Ltd.

The statutory report states that total number of shares allotted is 125,000, of which 35,814 are fully paid, 100 are 16s. paid, 79,110 are 15s. paid, 9,166 are 10s. paid, 802 are 4s. 8d. paid, 1 is 2s. 6d. paid, and 7 nil. Total amount of cash received in respect of shares issued wholly for cash is £99,997. Payments were: Preliminary expenses, £7,799.; underwriting commission and brokerage, £6,517; expenses prior to formation of company, £990; interest on calls paid in advance, £85.; plant, machinery, furniture, etc., £4,469.; on account of laboratory, etc., £592., £50,000. 5 per cent. War Loan, 1929-47 £50,479. revenue suspense account £2,043. cash at bank and in hand at August 22 £27,019. Preliminary expenses were estimated at £6,000.

Hampden Cloncurry Copper Mines, Ltd.

A loss of £8,779 was sustained for the half-year ended February 28 (against £4,512. for the corresponding half-year). By adding £8,109. provided for depreciation, the total to the debit of the profit-and-loss account is £16,889. This has been adjusted by the transfer of a similar amount from equalisation reserve. The ore reserves are estimated at 135,000 tons, containing 7,110 tons of copper; but of this 93,000 tons, estimated to contain 2,890 tons of copper, is low-grade material which could not be profitably treated under present conditions; and 42,000 tons, estimated to contain 4,220 tons of copper, will, it is expected, be profitably treated when a resumption of smelting on the field is again warranted. The above total estimate includes 15,454 tons lying on the surface.

F. Steiner and Co., Ltd.

The report states that after adjustment of excess profits duty, etc., and deducting £190,212. for repairs and depreciation, the profit for the period of three years to July 31 last is £241,495., which, with £35,287. brought forward, makes a total of £276,783. After paying debenture interest and preference dividend for the three years and 5 per cent. on the ordinary shares for the years 1921 and 1922, the available balance is £107,783., out of which the directors have placed £30,000. to general reserve and recommend a dividend of 7½ per cent. for the past year on ordinary shares, leaving a balance of £42,158. to be carried forward.

Dominion Tar and Chemical Company, Ltd.

The accounts for the half-year ended June 30 show a net profit of £49,321. (against £29,955. in the corresponding half-year of 1922). It is proposed to place £20,800. (against nil) to depreciation account, and to pay a final dividend for the half-year of 2½ per cent., free of tax, making a total distribution of 5 per cent. for the half-year (against 7½ per cent). The sum of £10,000. (against £8,130.) is carried to general reserve, and £6,021. is carried forward.

Broken Hill Proprietary Block 14 Co., Ltd.

The report for the half-year ended March 31 states that financial arrangements have been made with the Associated Smelters whereby active operations have again been made possible after a cessation of production practically extending over a period of four years. The accounts show that the credit balance as at September 30 last was £4,292. The loss for the half-year under review was £5,769., which after deducting the above credit balance is reduced to £1,477.

DIVIDENDS.

Burt, Boulton and Haywood, Ltd.—Dividend of 4 per cent., payable, free of tax, on the ordinary shares for the half year ended June 30, making 8 per cent., free of tax, for the year. For the preceding year the dividend was 7½ per cent., free of tax.

Pinchin, Johnson and Co., Ltd.—For the half-year ending June 30, it is resolved to declare an interim dividend of 6 per cent., actual, on the ordinary shares, compared with 5 per cent.

Benzol and By-Products, Ltd.—The reduction of capital from £700,000. to £573,690. was confirmed by the High Court of Justice (Chancery Division) on July 31, and registered by the Registrar of Joint Stock Companies on August 22.

Home Grown Sugar, Ltd.—The reduction of capital from £50,000. to £30,000. was confirmed by the High Court of Justice (Chancery Division) on July 25, and registered by the Registrar of Joint Stock Companies on August 8.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Clement and Johnson, Ltd., London, W.C., chemists.—Registered August 17, £500., £300., £100., £100., £100., £500., and £200. debs., part of £60,000.

Cowley Celluloid, Ltd., Cowley (Middlesex).—Registered August 13, £500. deb., to C. C. Robinson, 4, Glebe House, Cross Lanes, Guildford; general charge.

Pickles, Ayland and Co., Ltd., Ossett (Yorks.), chemists.—Registered August 14, £2,000. deb., to A. Kilbank, The Screeds, Ashby, works manager; general charge.

Thames Chemical Company, Ltd., Watford.—Registered August 4, £3,000. debs.

Wilkinson (L. G.), Ltd., London, E.C., French polish manufacturers.—Registered August 14, charge, to London Joint City and Midland Bank, Ltd., securing all moneys due or to become due to the bank.

SATISFACTIONS.

Nobel Industries, Ltd., London, S.W.—Satisfaction registered August 20, £3,000,000., registered January 4, 1921.

Standard Match Company, Ltd. (old company), Hempsted.—Satisfactions registered August 21, £5,100., registered January 26, 1922; £2,000. registered September 16, 1922; and all moneys (two morts.), registered March 23, 1923.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Holywell Soap Company, Ltd., Liverpool.—Resolved July 20, confirmed August 10: That the company be voluntarily wound up. C. Bradburn, Bank Chambers, 3, Cook Street, Liverpool, liquidator.

Waverley Oils, Ltd., London, E.C.—G. W. Spencer ceased to act as receiver, August 20.

COUNTY COURT JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Smith, Fredk. Geo., 4, York Gardens, Clifton, Bristol (trading as Yorkshire Reno Metal and Floor Polish Manufacturing Company); £16. 7s. 1d. July 13.

Pomerantz, Harry, 85, Roman Road, Bow, drug merchant; £13. 9s. 4d. July 5.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Canada.

A manufacturers' agent in Montreal, with an established connection, who already represents a British manufacturer of a non-competitive line, desires to secure the representation of a British producer of china clay. (Ref. No. 245.)

H.M. Trade Commissioner at Winnipeg reports an inquiry for the supply of 135,000 fire bricks of standard size and quality. (Ref. D.O.T. 11,947/E.D./M.C./2.)

Norway.

A firm of commission agents in Christiania desire to secure the representation for Norway of British exporters of salt and soda. (Ref. No. 252.)

Poland.

A commission agent in Warsaw desires to secure the representation for Poland of British manufacturers of chemicals. (Ref. No. 254.)

Switzerland.

An agent in Lausanne is desirous of obtaining the representation of British firms for the sale of drugs, etc., in Switzerland. (Ref. No. 256.)

United States.

A firm of importers in San Francisco wish to communicate with British producers and exporters of ferro alloys (ferro-silicon 50 per cent. and ferro-manganese 78—82 per cent.), china clay, and fuller's earth, with a view to obtaining agencies for the State of California. They are prepared to work on a commission basis or would purchase on own account. (Ref. No. 264.)

A firm of manufacturers' agents in San Francisco wish to communicate with British exporters of sulphate of ammonia, Portland cement, fish oils, fishmeal, and whale guano, with a view to obtaining agencies, on a commission basis, for the Pacific Coast of the United States. (Ref. No. 265.)

South Africa.

H.M. Trade Commissioner in South Africa reports a call for tenders for the supply of 1,800 tons of tar or tar substitute. (Ref. No. 11,996/E.D./C.C.(2).)

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," September 8, 1888.)

The Aluminium Boom.—Once upon a time, M. Pechiney, of Salindres, was the only maker of metallic aluminium in the world. Many had worked at the problem, and in the course of time found the manufacture unprofitable, or perchance their carefully devised reactions oft-times failed to take place, or even the coveted metal was not disposable after it had been secured, so that finally M. Pechiney was left alone, the aluminium king, monarch of all he surveyed. In another column of this week's issue may be found an account of the recent meeting of the shareholders of the Alliance Aluminium Company, Ltd., at which one of the directors of the company announced his opinion that the shareholders had got hold of a good thing; no doubt they have, but we would be inclined to think that the promoters had got hold of a better, as good things do not always pay from a £. s. d. point of view. It is only a few weeks since we had to chronicle the visit of a number of savants to the aluminium works at Oldbury, and later one of our friends called upon us and exhibited a bar of the pure (?) metal said to have been made at this works. When we say a bar, we would like to qualify the impression as to the size thereof—one inch by one-half an inch by quarter of an inch is certainly a bar, even if it be a small one. The question is, now, "What will they do with it?" There is no doubt a large demand for samples will spring up; but after that is satisfied, it is not yet certain where the makers of the metal will have to look for an outlet amongst the arts of peace.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

August 20 to 25 (inclusive).

Separating Substances from Solutions. Aktiebolaget Separator. 21,378.
Crystallisation Processes. Appareils et Evaporateurs Kestner. 21,503.
Cement. Blachorovitch, I. A. S. 21,401.
Emulsions. Brettell, F. G. (*Symons*). 21,230.
Asphalt. Building Accessories and Flooring Co., Ltd.; Smith, H.; and Goodwin, H. 21,143.
Printing-inks. Burns, W. A. 21,353.
Viscous Products. Chemische Fabrik auf Actien vorm. E. Schering. 21,412.
Sodium Carbonate. Cocksedge, H. E. 21,186.
Water Gas. Dvorkovitz, P. 21,082.
Removing Free Moisture from Substances. Elmore, G. H. (*Comley*). 21,137.
Fire-resisting Compositions. Hocking, C. M.; and King, P. H. 21,540.
Formic Acid. Johnson, J. Y. (*Badische Anilin- und Soda-Fabrik.*) 21,072.
Oxygenated Organic Compounds. Johnson, J. Y. (*Badische Anilin- und Soda-Fabrik*). 21,386 and 21,388.
Synthetic Manufacture of Methanol. Johnson, J. Y. (*Badische Anilin und Soda-Fabrik*). 21,387.
Chemical Heating-appliance. Lancaster, R. C.; and Shields, A. McLellan. 21,160.
New Salts of C.C. Disubstituted Barbituric Acids. Layraud, E. 21,181.
Valuable Hydrocarbons from Inferior Material. Linnmann, G. 21,458.
Promoting Circulation of Liquids in Tanks. McClelland, N. E. 21,267.
Purifying-apparatus for Industrial Oil. Mertz, F. 21,517.
Obtaining Nitrogen from the Air. Nelson, W. A. 21,103.
Compounds Containing Active Oxygen. Noll, F. 21,099.
Continuous Analysis of Mixed Gases. Piccard, A. 21,289.
Dispersions. Plauson's (Parent Co.), Ltd. (*Plauson*). 21,204
Recovery of Metallic Substances from Flue Gases. Procter, H. A. 21,039.
Clarification and Decolourisation of Sugar. Ragg, J. J. 21,565.
Drying Apparatus. Schmidt, O. 21,074.
Producing Fast Tints on Fibres. Soc. of Chemical Industry in Basle 21,078.
Treatment of Fatty Residues. Vosters, H. F. A. 21,485.
Recovery of Soda from Solutions. Wallace, W. M. 21,089.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.

1922.

Vulcanising Rubber. Cadwell, S. M. 4,518. **177,493**
Dry Distillation of Bituminous or Cellulose-containing Material. Moscicki, I. 4,629. **202,333**
Treatment of Fumes Produced in the Manufacture of Fish Guano. Daniels, G. W.; Heathcote, B.; and Spencer, C. 12,677. **202,368**

New Salts of C.C. Disubstituted Barbituric Acids. Layraud, E. 21,181. **202,660**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Reduction of Water-Insoluble Organic Compounds. W. G. Adams, N. E. Siderfin, D. G. Murdoch, and W. L. Galbraith, Gas Light and Coke Company, London. British Patent, **200,167**, of 1922.

The reduction of water-insoluble organic compounds, particularly aromatic nitro compounds, by means of an alkali-metal or like amalgam, is effected by bringing an intimate mixture of the substance with an aqueous reagent into contact with the amalgam; the mixture may be in the form of an emulsion prepared with or without the aid of emulsifying agents. The reaction is preferably carried out so that the used amalgam is continuously removed after contact with the mixture; thus the amalgam may be passed in a subdivided form through the agitated mixture, or the latter may flow in a thin layer over the amalgam, which also may be in motion; the mixture and amalgam may be brought repeatedly into contact, the former being re-emulsified if necessary between successive contacts. When the reduction product is insoluble in alkali, the latter may be recovered, the process being thus

FIG. 1.

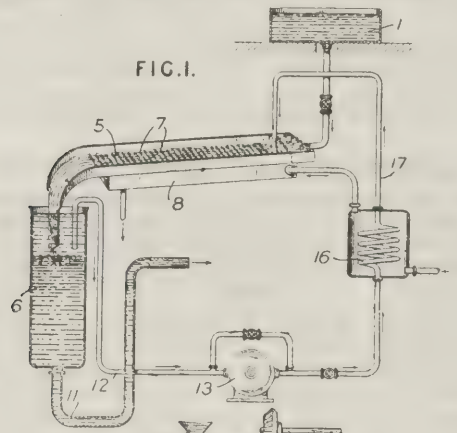

FIG. 2.

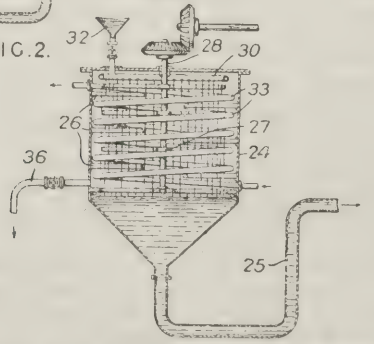

cyclically combined with the electrolytic decomposition of brine in a mercury-cathode cell. High concentration of nitro compounds in the emulsion favours the production of azo and hydrazo compounds, while low concentration favours amine formation. With the apparatus shown in Fig. 1, a sloping trough 5 provided with ridges 7 on its bed and a heating-jacket 8 is supplied with amalgam from a container 1, and with an emulsion of nitro compound and water by pipe 17; the mixture discharges into a separator 6, the mercury flowing off by pipe 11 back to the electrolytic cell, while the aqueous mixture is drawn off and emulsified by pipe 12 and pump 13 and recirculated through the heater 16 and pipe 17 to the trough. The apparatus shown in Fig. 2 comprises a container 24 provided with staggered baffles 26, a rotary shaft 28 with blades 27, and a heating-coil 33. The lower part of the container is filled with mercury, the mixture of nitro compound and water is added, and the stirrer and heater set in operation; amalgam is then fed in from a hopper 32 and is distributed through the charge from a perforated coil 30; the mercury flows away by pipe 25 back to the cell, and the aqueous mixture, when sufficiently heated, is run off by pipe 36. The reduction of nitro benzene to a mixture of hydrazo benzene, azo benzene, and aniline, and of *o*-nitroanisol to *o*-anisidine, azoanisol, and hydrazoanisol, is described. Specification 3090/96 is referred to.

Electrolytic Cells. L. Casale, Rome. British Patent, **200,376**, of 1922.

In a cell for the generation of oxygen and hydrogen, each electrode comprises a column of sheet-iron strips 5, Fig. 2, bent into rectangular frames with sloping sides. Each column is surmounted by a hood 6 projecting above the liquid. The strips 5 are connected together by vertical strips supported by rods passing through insulating glands in the roof. Gaps 17 are provided in the bottom members of the columns. The cell is divided by partitions 12 into anode and

FIG. 2.

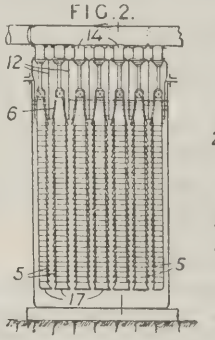

FIG 3

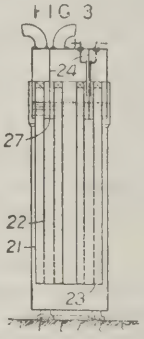

cathode compartments, from which the gas is withdrawn by pipes 14 connected to headers. A circulation of electrolyte up through the electrodes and down between them is set up, promoting separation of the gases without the use of a diaphragm. In a modification, the cathode consists of a cylindrical sheet 22, Fig. 3, provided with sloping gaps and an unperforated sheet 21 connected to it at the bottom by an annular plate 23. The anode is mounted within the cathode and consists of an outer cylinder with sloping gaps and an inner unperforated sheet.

Aluminium-silicate Detergents. F. H. Guernsey, and Electric Smelting and Aluminium Company, New York, U.S.A. British Patent, **200,175**, of 1922.

A crystalline detergent compound which is solid at ordinary temperatures, and having the formula $Al_2O_3(SiO_2)\ x\ (Na_2O)\ x\text{-}1\ (H_2O)y$, where x represents any number greater than seven, is made by boiling together a mixture of aluminium silicate, sodium silicate, and caustic lye. The boiled mixture is preferably chilled to a semi-plastic condition, and allowed to solidify. When x has the value 75, the compound is completely soluble and has a melting-point of 126° F. To enhance the water-softening properties of the compound, alkali metal salts of weak acids such as sodium or potassium carbonates, or other carbonates, or phosphates or borates, may be mixed with it. An emulsifying agent such as sulphonated or saponified oils or fats may also be added, preferably in amounts of about 5 per cent. To provide for loss of alkali oxide during cleansing operations, a further amount of oxide, up to 2 molecules for each molecule of detergent, may be mixed with the compound.

Synthetic Thymols. Howards and Sons, Ltd., Ilford, Essex; and J. W. Blagden, London. British Patent, **200,151**, of 1922.

M-cresol and isopropyl alcohol are condensed by the aid of phosphoric acid. If the condensation is effected at 70–80° C. thymol is the chief product, while with a temperature of about 150° C. a condensation product melting at 114° C. is obtained. Examples are given showing the procedure in each case. The resulting mixture is distilled with steam. With the high-temperature condensation the oil obtained from the steam distillation is dissolved in alkali, the insoluble portion separated, and the solution acidified to reproduce the oil, which is allowed to crystallise. The remaining liquor is again distilled and allowed to crystallise. The product of melting-point 114° C. has antiseptic properties.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Perylene Vat Dyestuffs. H. Pereira. Vienna. British Patents, **199,721, 199,722,** and **199,720.** Convention dates, June 20, 1922.

Aminoperylene quinones and their derivatives are obtained by the reduction of the corresponding nitro compounds. According to the examples, a suspension of mono- or dinitroperylene quinone or of bromodinitroperylene quinone in caustic soda solution is heated with sodium bisulphite and a current of air then blown through the hot liquid to precipitate the amino compound, which is recrystallised from hot aniline or nitrobenzene. Diaminoperylene quinone and its bromo derivative dye cotton violet from the vat.

Acyl derivatives of aminoperylene quinones or their substitution compounds are obtained by heating the aminoquinones with acids or acid derivatives. According to the examples, (1) a solution of diaminoperylene quinone in nitrobenzene is heated with benzoyl chloride; the dibenzoyldiaminoperylene quinone which is precipitated by the addition of alcohol, dyes cotton salmon red from a violet red vat; (2) a solution of diaminoperylene quinone in nitrobenzene is heated with anhydrous acetic acid; the acetyl derivative which separates on cooling dyes cotton a brown violet from a red violet bath; (3) bromodiaminoperylene quinone is heated with benzoyl chloride; cooling or the addition of equal parts of alcohol and ether precipitates the benzoyl derivative which dyes cotton a copper bronze from a cherry red vat. Dinitroperylene quinone is produced by the nitration of perylene quinone or mononitroperylene quinone. According to the example, a mixture of perylene quinone with glacial acetic acid and concentrated nitric acid is heated to boiling, mononitroperylene quinone separates out at first but becomes further nitrated on continuing the boiling. The product dyes cotton violet from a brownish violet vat.

Acetylene Polymerisation Products. Elektrizitätswerk Lonza, Basle, Switzerland. British Patent, **200,087.** Convention date, June 30, 1922.

In the production of solid polymerisation products of acetylene, such as "cuprene," by bringing acetylene into contact with a catalyst—for instance, copper,—at a raised temperature, losses due to coking are reduced by adding a percentage—for example, 5-15 per cent.—of nitrogen to the acetylene.

PUBLICATIONS RECEIVED.

Practical Chemistry for High Schools.—By H. B. Dunnicliff, M.A., B.Sc., A.I.C. (Professor of Chemistry, Government College, Lahore). 1923: London: Macmillan and Co., Ltd.; price 5s.

Rotary Air Compressors and Exhausters.—Rolling drum type. The latest pamphlet (No. 100A) of Reavell and Co., Ltd., Ranelagh Works, Ipswich. A great range of sizes are now manufactured, and many improvements have been embodied in the design of the machine, the principle of which, however, remains unaltered. Copies may be had by readers on application to the firm.

American Electro-Chemical Society.—We have received a synopsis of the autumn meetings to be held by the American Electro-Chemical Society in Dayton, Ohio, U.S.A., on September 27, 28, and 29. A very interesting programme has been drawn up, and includes papers on "The Development and Future of Electro-Deposition," "Organic Electrochemistry," and the "Utilisation of Chlorine." There will also be a symposium on "The Electro-chemistry of the Gaseous Condition."

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—The most important alteration in this market is a further considerable cut in prices made by the British makers of borax products, followed immediately by a similar reduction in the prices of imported material. Other items are showing little change, with business still mostly small and slow. **Acetic Acid,** 80% technical, £47.; 80% pure, £51.; 98% glacial, £60. in casks and about £73. in glass demijohns, ex wharf London; inquiry is still good for the limited supplies available, with the market holding quite firm. **Acetone,** British Government specification, £125. to £127. per ton, in drums; it seems almost certain that this market is likely to hold firm for some time, and higher rates are expected, owing to continued shortage of supplies. **Alum,** lump, in casks, £10. per ton; dealers are offering Continental material at about this figure, but business remains slow. **Arsenic,** Cornish white powdered, about £70. per ton; easier prices are being quoted, with little doing; foreign material is offering cheaply. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; this market appears to have been inactive during the past week; quoted rates are unchanged. **Barium Chloride,** 98—100%, about £15. per ton; at this level the spot position seems fairly steady. **Bleaching Powder,** 35—37%, about £10. per ton; dealers offering Continental material at about this figure; British makers quoting at £11. 5s., for home trade only. **Borax,** commercial, granulated £24. 10s., crystals £25., powdered £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to station in Great Britain; British makers notify a reduction of £2. per ton on all grades to the above figures. Dealers have also reduced their prices to: Commercial, granulated £23. 10s., powdered £25. per ton, for home trade, under similar conditions to makers as to delivery and packages. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers have reduced their prices by £4. per ton to the above figures, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid in Great Britain. British makers notify a reduction of £2. per ton on all grades to the above figures; dealers are offering some grades at competitive rates. **Cream of Tartar,** 99—100%, about 88s. to 90s. per cwt., less 2½%; these prices are being quoted on spot for good quantities, and the market seems fairly firm, with moderate business doing. **Citric Acid,** B.P., crystals, about 1s. 6d. per lb., less 5%; the position on spot remains unsatisfactory, with little doing; stocks available. **Epsom Salts,** commercial quality, about £5. per ton, in bags; dealers find little demand for spot parcels on the market. **Formaldehyde,** 40%, on spot, about £95. per ton; interest is being shown in material to arrive, which is offering in the region of £75. per ton. **Glauber's Salt,** commercial quality, £3. 15s. to £4. per ton, in bags; this market remains flat, with quoted rates unchanged. **Lead Acetate,** brown, about £40. to £41.; white, about £42. per ton; at these levels the market seems fairly steady, but business is quiet. **Litharge,** about £35. 10s. to £36.; dealers' prices hold well at about these figures, and some limited business has been done. **Lithopone,** 30% Continental red seal, £22. to £22. 10s. per ton; this is a very healthy market, and quite a fair business is being done; some of the best brands are fetching higher rates. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; spot stocks are available; business is small; prices steady. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers state that their prices are unchanged at these rates. **Oxalic Acid,** about 6d. per lb.; the dull tone of this market recently commented upon is still very evident, and quoted rates are unchanged. **Carbonate of Potash,** 90—92%, about £26. 10s. to £27., 96—98%, £30. to £31. per ton; last week's cheaper prices hold fairly well, but the market remains quiet. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; the market seems easy at this figure, with business

restricted. **Caustic Potash,** 88—92%, on spot, about £30. per ton; easier prices were mentioned last week, and at these lower levels the market is not at all healthy. **Permanganate of Potash,** commercial quality, about 9½d. per lb.; the market keeps up to this rate fairly well, and business is sustained. **Prussiate of Potash,** yellow, about 1s. 1d. per lb.; after the further reduction in price recorded last week this market seems steadier, but business is still restricted in volume. **Sulphate of Potash,** 96%, £11. 10s. per ton, ex ship; there is no change in values to record. **Mercury,** about £9. per bottle of 75—76lb., net; this market has been decidedly quiet of late, and prices are weaker. **Red Lead,** imported, about £35. 10s. to £36. per ton; dealers are finding some limited business at about these figures. **Salammoniac,** dog-tooth crystals, £48. 10s. to £49.; medium, £43. to £44.; fine white crystals, £25. to £26. per ton; importers continue to quote at about these prices, but there is nothing much doing; spot stocks are available. **Saltcake,** ground and unground, home trade, about £4. per ton; export, about £4. 10s. to £5. per ton; makers' prices are at about these figures, with inquiry good. **Acetate of Soda,** about £25. per ton; inquiry seems small, but quoted rates are fairly steady. **Soda Ash,** 58% light alkali, £7. 12s. 6d. per ton, in bags, carriage paid in Great Britain; British makers quote at this unaltered rate, for home trade only. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers have reduced their prices to the above figures. British makers' prices stand at the reduced rates stated last week: 70—72%, £16. 17s. 6d.; 76—77%, £18. 7s. 6d. per ton, in drums, carriage paid to destination, for home trade only. **Bicarbonate of Soda,** £10. 10s. per ton, in bags, carriage paid to destination, British makers quote at this rate for home trade only; mineral water quality, £9. per ton. **Bichromate of Soda,** home trade, about 4½d. per lb.; export, slightly more; British makers quote at these prices. **Cyanide of Soda,** 98—100%, export, 8½d. to 9d. per lb.; home trade, about 10d. per lb.; British makers' prices given. **Nitrate of Soda,** 96%, £13. 7s. 6d. per ton, f.o.r. or f.o.b.; prices quoted are unchanged on the week. **Nitrite of Soda,** 100%, about £26. 10s. per ton; this market is on the firm side, with inquiry good, and stocks restricted. **Prussiate of Soda,** about 6d. per lb.; this rate is being quoted, but business is not at all good; the market seems fairly steady. **Hyposulphite of Soda,** pea crystals, about £13. 10s. to £14. per ton, in 1cwt. kegs; commercial quality, about £9. per ton, in casks, on spot; prices are easier this week, with demand poor. **Sodium Sulphide,** 60—62%, solid, £14.; ditto, broken, about £15. per ton, in drums; 60—65%, concentrated, in casks, about £14. 10s. per ton; business is still quiet in these products, with prices unsteady. **Sulphate of Copper,** £26. per ton; British makers state that this is their present quotation; dealers are offering imported material at cheaper rates. **Tin Crystals,** 1s. 4d. per lb.; this market is unchanged on the week. **Tartaric Acid,** B.P., crystals, about 1s. 2d. per lb., less 5%; the spot position is about the same, with plenty of material on offer, but only a small demand; the market is far from steady. **White Lead,** imported, about £43. per ton; importers are quoting at about this figure, with some business passing. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers report that they are now quoting at these higher rates on account of the state of the spelter market.

Pharmaceutical Chemicals.—Very little change has taken place in this market during the past week. Business remains restricted to small quantities, with dealers holding their prices up fairly well. **Acetanilid,** crystals and powder, about 1s. 6d. per lb., the demand remains slow and limited; larger quantities are at cheaper prices. **Acetyl-Salicylic Acid,** B.P., about 3s. to 3s. 1d. per lb.; dealers holding stocks of good brands are quoting at these figures, with business limited. **Benzoic Acid,** B.P., about 2s. 6d. per lb.; this market seems of no interest; values nominal. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per lb.; dealers' prices hold at about this figure, but business is quiet. **Salicylic Acid,** B.P., about 2s. 3d. per lb.; this market seems rather irregular on quotation, but the tendency seems to a firmer basis. **Tannic Acid,** leviss, about 3s. 2d. to 3s. 4d. per lb.; slightly easier rates are being quoted here for good quantities; market dull. **Amidopyrin,** about 14s. per lb.; this market shows little sign of life, though quotations on spot are varying. **Ammonium Bromide,** about 7d. per lb.; the demand is still unsatisfactory, but prices seem a little steadier on spot. **Benzonaphthol,** about 5s. per lb.; this market remains dull, with quoted rates unchanged. **Benzaldehyde 03,** 3s. per lb.; a quiet week of business, with quoted rates level. **Betanaphthol,** resublimed, about 1s. 10d. per lb.; this market is a shade easier, and remains quiet. **Calcium Lactate,** about 1s. 9d. per lb.; dealers' prices show no further fall, and seem steady; business small. **Chloral Hydrate,** duty paid, about 4s. per lb.; some spot goods might be picked up at slightly easier rates. **Creosote,** B.P., 2s. 5d. to 2s. 6d. per lb.; business remains small; quoted rates unchanged. **Creosote Carbonate,** about 8s. 6d. per lb.; this market has been almost inactive. **Guaiacol Carbonate,** about 8s. 3d. per lb.; the position is unchanged on the week. **Hexamine,** about 3s. 9d. per lb.; offerings on spot are round about this figure, but there is no great amount of business about. **Hydroquinone,** about 3s. 6d. per lb.; this market seems to be weakening, and some slightly cheaper offers are being made. **Methyl Salicylate,** about 2s. 4d. to 2s. 6d. per lb.; at these slightly easier rates the market is still dull. **Methyl Sulphonal,** about 15s. per lb.; this price is quoted, but there seems to be little interest in this article. **Paraformaldehyde,** about 3s. 6d. per lb.; at this unchanged value the market keeps steady, but is still rather quiet. **Paraldehyde,** 1s. 5d. to 1s. 7d. per lb., according to quantity; spot offers are on the market, with not much business passing. **Phenacetin,** about 6s. to 6s. 3d. per lb.; this market holds up very well, with some small orders being placed. **Phenazone,** about 7s. 3d. to 7s. 6d. per lb.; a slight reduction in quoted values is recorded, with the market quiet. **Phenolphthalein,** about 6s. 6d. per lb.; quoted values are very irregular, with some as high as 7s. per lb. **Potassium Bromide,** B.P., crystals and granular, 6d. to 6¾d. per lb., according to quantity; this market is still a weak feature, with little business about. **Potassium Permanganate,** B.P., about 10d per lb.; at this level the spot position seems quite healthy, and business fairly good. **Potassium Sulphoguaiacolate,** about 5s. 6d. per lb.; nominal; no business or inquiry reported. **Sodium Benzoate,** 2s. 4d. to 2s. 6d. per lb., nominal; the market remains idle. **Sodium Bromide,** B.P., crystals and granular, 7d. to 7½d. per lb.; supplies are offered on spot, with not much demand; market weak. **Sodium Diethylbarbiturate,** about 18s. 6d. per lb.; prices quoted are unchanged, but business is lacking badly. **Sodium Salicylate,** powder, about 2s. 5d.; crystals, about 2s. 8d. per lb.; this market keeps up very well, and there is inquiry about, with spot stocks rather low. **Sulphonal,** about 14s. to 14s. 6d. per lb.; some cheaper offers are being made, but business is small. **Terpin Hydrate,** about 1s. 9d. per lb.; this market holds up well, although there is not much doing. **Thymol,** about 15s. per lb.; the market is easy at this figure.

Coal-tar Products, Intermediates, Etc.—One or two changes are recorded. Carbolic acid crystals are firmer. Pitch is somewhat easier. Other products are about the same on a dull market. **Aniline Oil** is a better market, with the prices fully maintained at 9d. to 9½d. per lb., drums free. **Aniline Salt** remains dull as quoted at 9½d. to 10d. per lb., casks free. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; some little inquiry is on the market. **Benzol,** 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; quoted prices are unchanged, with the market dull. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; at these rates the market seems fairly firm. **Xylol,** pure, 2s. 3d.; commercial, 1s 9d per gallon, drums extra; unchanged rates are on the market, which is still dull. **Naphtha,** about 1s. 4d. per gallon; this market is still showing little life, but quoted rates are maintained. **Solvent Naphtha,** 90/160, 1s. 5d. per gallon, drums extra; at this quoted rate the market is weak and dull. **Heavy Solvent Naphtha,** 90/190, about 1s. 4d. per gallon, drums extra; the market is weakening, with very little doing. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; the market is quiet, with values unaltered. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; dealers' prices are at the old rates, with business quiet. **Creosote Oil,** about 9½d. per gallon, f.o.b.; last week's reduced price is maintained, with the market now steady. **Carbolic Acid,** crystals, 1s. 2d. per lb., f.o.b.; this market has recovered a little, and is now much firmer. **Naphthalene,** about £20. per ton; rather weaker, and quiet; crude, £7. to £13.; powder, £17.; crystals, £23.; balls, £24.; tablets, £28.; candles, £28. per ton, packages free.

Disinfectants, 3s. 9d. per gallon, barrels free; the market quotation keeps steady at this rate. **Pyridine,** 20s. per gallon; owing to shortage of supplies, the spot position keeps quite firm. **Hexamethylene,** about 3s. 9d. per gallon; no further fall in values is recorded; market quiet. **Pure Methyl Alcohol,** £100. per ton, ex wharf London; this price is well maintained, with some business about. **Pitch,** about 135s. per ton, East Coast; quoted rates are somewhat easier at this lower level, and the market is quiet. **Sulphate of Ammonia,** home trade, 25¾%, £14. 10s. per ton, ex works, September.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £64. 5s. to £64. 7s. 6d., cash; £65. to £65. 2s. 6d., three months; electrolytic, £69. 5s. to £69. 15s. **Tin**: Standard, £198. to £198. 2s. 6d., cash; £199. to £199. 2s. 6d., three months; Straits, £202.; English, £198. 10s. **Lead,** soft foreign, £25. 17s. 6d., prompt; English, £27.; chemical sheet, 34s. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 15s.; hard, £28. **Antimony,** English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £8. 15s. **Bismuth,** 10s. **Platinum,** 500s. per oz. **Wolfram,** spot, 12s. 6d. to 12s. 9d. per unit, c.i.f. United Kingdom or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 90—92%, £47. 10s. per ton, delivered; Beaver brand, 90%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45.

MANCHESTER CHEMICAL MARKET. Wednesday.

There has been a slight improvement in demand for heavy chemicals during the past week, but values as a whole show no improvement, and quotations generally are in buyers' favour. In the alkali trade, prices are steady at the recent reductions, and makers are fairly well engaged with orders. **Bleaching Powder,** softwoods, quiet at £11. 5s. per ton on rails, but foreign supplies are offered at much lower prices. **Bichromates** and **Chlorates,** unchanged at recent rates, with only small business reported. Roasted **Saltcake** continues in good demand for export, but quiet for home trade at £4. 10s. to £4. 15s., carriage paid. Imported American **Sulphur** is firm at £5. 5s., free on rails. **Copper Sulphate** continues slow of sale, and quotations nominal at £25. 10s. to £26., f.o.b. **Phosphate** and **Commercial Hyposulphite of Soda** only selling in small lots, and prices are easy. **Nitrite of Soda,** firm at £26. 10s., ex store. **Concentrated Sodium Sulphide,** £15. per ton. **Nitrate of Soda,** easier at £13. 5s., f.o.r. Liverpool. White powdered **Arsenic** is only in small request, and price is maintained at £68. for Cornish make, carriage paid North of England. Yellow **Prussiates** are again lower: **Potash** 1s. 1d., and **Soda** 6d. per lb., carriage paid. **Carbonate** and **Caustic Potash** are well maintained at recent quotations, and there is fairly good inquiry. Brown **Acetate of Lime,** unchanged at £11. 10s. per ton; grey firmer at £21. **Acetate of Soda** and **Acetic Acid** are unaltered. **Miscible Wood Naphtha,** firm at 6s. 6d. per gallon. **Acetone,** scarce and dearer at £130. per ton. **Lead Salts** are dull: White **Acetate** £41., brown £43.; and **Nitrate,** £42., delivered. **Barium Chloride,** steady at £14. 10s. to £15. per ton. **Oxalic Acid,** weak at 6d. per lb., with only small inquiry. **Permanganate of Potash,** steady at 9¾d. to 10d. per lb., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

Inquiries for **Tinplates** were more numerous, and prices were on the basis of £1. 3s. 1½d. per standard box. **Galvanised Sheets,** steady at £18. 7s. 6d. per ton. **Copper** easier, with prompt at £63. 2s. 6d. per ton, and three months £64. 2s. 6d. **Tin** dearer; prompt £192. 7s. 6d. per ton, and three months £193 7s. 6d. **Lead** steady, and firm at £25. 2s. 6d. per ton cash, and £24. 17s. 6d. forward; English, £26. 5s. **Spelter** firm, but business rather dull at £32. 17s. 6d. per ton prompt, and £32. 12s. 6d. forward. **Zinc Sheets** in good demand at £39. 7s. 6d. per ton, f.o.r. at works. **Sulphate of Copper,** dull at £26. 2s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda** met with better sale at £13. 12s. 6d. per ton, in bags at docks. **Bone Meal** dull; prompt, £9. 2s. 6d. per ton, f.o.b., with Indian for shipment at £8. 12s. 6d. **Rape Oil** slow, with best refined at £2. 3s. 3d. per cwt. **Cod Oil** quiet, with Newfoundland £1. 19s. 6d. per cwt. **Seed Oils** firm; raw **Linseed,** £2. 3s. 1½d. per cwt., and boiled £2. 5s. 3d., in barrels; and **Coconut Oil,** £2. 3s. 3d. per cwt. **Cottonseed Oil,** common edible £2. 2s. 3d. per cwt., and deodorised £2. 5s. 3d. **Palm Oil** firm, and in better demand, with Lagos at £35. 7s. 6d.; softs, £34. 13s. 6d. prompt, and £34. 12s. 6d. forward; mediums, £35. 7s. 6d.; and hards, £35. 12s. 6d. per ton. **Benzol,** on small supplies at 1s. 4d. to 1s. 6d. per gallon. **Turpentine** quiet, with prompt American at £3. 13s. 9d. per cwt. **Oxalic Acid,** dull at 6¼d. per lb., f.o.r. **Copperas,** in bulk, four tons and over at £2. per ton, delivered. **Sulphuric Acid,** fair demand at late rates. **Pitch,** quiet at £6. 12s. 6d. per ton. **Arsenic,** in better call, and slightly easier; white powdered, £68. 2s. 6d. per ton. An optimistic feeling was manifest in **Coal** circles: Best Admiralty smokeless £1. 9s., seconds £1. 8s., ordinaries £1. 7s.; Monmouthshire black veins, £1. 8s. 6d., all per ton, f.o.b. **Anthracite** prices very firm: Best large £2. 10s., seconds £2.; French nuts, £3. per ton, f.o.b. **Patent Fuel,** in quiet demand at £1. 10s. to £1. 13s. 6d. per ton, f.o.b. **Cokes,** in stronger demand; export, £2. 7s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, on rails at ovens.

LIVERPOOL CHEMICAL MARKET. Wednesday.

A fair demand for chemicals of the heavier class for use in the United Kingdom can be recorded, consumption appearing to have settled down on a scale commensurate with requirements. In the export branch of the trade there has been a slightly freer inquiry, and shipments on the whole have been well maintained. **Bleaching Powder** has been rather more inquired for, the lower price for use in the home trade appearing to have stimulated business somewhat; for the home trade, £10. 5s. to £10. 17s. 6d. per ton is quoted; and for export, £11. 5s. to £11. 17s. 6d. per ton. **Chloride of Calcium** continues in moderate demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has had a moderate inquiry from the home trade, and has again had a fairly active shipment on export account; it is £19. to £20. per ton for 76%, carriage paid in the United Kingdom. **Bicarbonate of Soda** has again been in very fair demand for use by the home trades, and has been shipped freely to distant ports; the price is £10. 10s. per ton, carriage paid, for use in the United Kingdom. **Soda Crystals** have been rather more in request on home-trade account; they are £5. 5s. per ton, carriage paid, for use in the United Kingdom. **Nitrate of Soda** has been but little in request, and is £13. 5s. to £13. 10s. per ton. **Borax** prices have been reduced all round; £25. per ton for commercial crystals, and £26. for powdered; higher grade crystals are £29. per ton, powdered £30., and superfine £31. per ton. **Saltcake** has been steadily called for on home-trade account; it is £4. 10s. to £5. per ton for use in the United Kingdom, and £5. to £6. per ton for export. **Bichromate of Soda** has had a moderate inquiry, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has been in very fair demand for home-trade uses, and is £7. 12s 6d. per ton for use in the United Kingdom, and £8. per ton for export, varying according to destination. **Hyposulphite of Soda** has been steadily called for, and is £10. to £10. 10s. per ton, in 2cwt. bags, for commercial; and £15. to £16. per ton, in 1cwt. kegs, for photographic. **Sulphide of Soda** has moved but slowly; solid is £14. 10s. to £15. per ton, and crystals £8. 10s. to £9. per ton. **Chlorate of Soda** continues lethargic, and is 3d. to 3¾d. per lb. **Phosphate of Soda** has been inactive, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been quiet, and is 6¼d. per lb. **Yellow Prussiate of Potash** has been more in request; the price has been reduced, and is 1s. 1d. to 1s. 2d. per lb. **Red Prussiate** has been very quiet, and is 3s. per lb. **Carbonate of Potash** has been in moderate demand, and is £25. to £33. per ton, according to quality. **Nitrate of Potash** has again been in fair request, and is £33. to £35. per ton for refined. **Chlorate of Potash** has been neglected, and is 3½d. to 4d. per lb. **Caustic Potash** has been in fair request, and the price has been reduced; it is £31. to £32. per ton. **Permanganate of Potash** has had a steady inquiry, and is 9¾d. to 10d. per lb. **Bichromate of Potash** has been in slightly better request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been in quietly steady demand; first quality is £63. per ton, second quality

is £60., and third £57. **Sulphate of Ammonia** has had a limited sale on home-trade account, but has had a fair shipment for export; it is £14. 10s. per ton for neutral of 25¾%, and £13. 7s. for ordinary of 25¼%, for use in the United Kingdom. **Carbonate of Ammonia** has been steadily called for, and is 4d. per lb. **Muriate of Ammonia** has been quiet, and is £32. to £33. per ton. **Magnesia** has been in very fair demand: **Carbonate** is £2. 5s. per cwt., and **Sulphate** £5. to £6. per ton. **Alum** has again had a quietly steady sale; it is £12. per ton for home-trade uses, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been but little in demand, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been rather more in request; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s., and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has been quieter, and is 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has had a very fair sale, and is £4. 10s. to £4. 15s. per cwt. **Boric Acid** prices have been reduced by home makers, and now stand at £48. per ton for commercial crystals, for home trade only; powdered, £50. per ton, bags free. **Citric Acid** has been quiet, and is 1s. 8d. to 1s. 8½d. per lb. **Oxalic Acid** has moved but slowly, and is 6¼d. to 6½d. per lb. **White Acetate of Lead** has had a very limited inquiry, and is £42. to £43. per ton. **Sulphate of Copper** continues quiet for home-trade uses, and has had a small shipment for export; it is £25. 15s. to £26. per ton, in casks, less 5%, f.o.b. at Liverpool. **Arsenic** has had a moderate inquiry; white powdered is £68. per ton.

WEST OF SCOTLAND CHEMICALS. Wednesday.

There has been a rather better demand for chemicals on home-trade account during the week, though inquiries for export are scarce. On the whole, prices generally continue steady at about previous figures. Cream of tartar and tartaric acid are easier. British manufacturers of borax products announce a reduction of £2. per ton on boric acid and borax; imported qualities have also been reduced to a little below these figures. Quotations, at Glasgow, are as follows:—**Alum**, quiet, and in small demand; prices steady at £12. 5s. for lump, and ground £12. 5s. per ton. **Arsenic** continues in short request, and supplies are still very scarce; the quotation stands steady at £74. per ton, net, on spot. **Barium Chloride** remains very quiet, despite the recent reduction to £15. per ton. **Bleaching Powder** does not show much movement, and the quotation is maintained at £11. 7s. 6d. **Boric Acid** and **Borax Crystals** are little sought for though prices have been reduced, and for the former stand at £48. per ton, and £25. per ton for the latter. **Borax**, granulated, is on offer at £24. 10s. per ton, net, in 2cwt. bags. **Calcium Chloride**, 70—75%, solid, £5. 12s. 6d. per ton. **Citric Acid** is a quieter market, with the price steady at 1s. 7d. per lb., less 5%. **Copper Sulphate** is but little in request at last week's figure at £27. 10s. per ton, less 5%, at Liverpool. **Cream of Tartar** quieter, with smaller inquiry at £4. 5s. per cwt. for 99%, at Glasgow. **Lead Acetate** is in fair request; brown rather better at £41. 10s. per ton, net; and white steady at £41. 10s. per ton, net. The market for **Magnesium Chloride** is slow, with quiet business at £3. for spot. **Oxalic Acid** is 6¼d. per lb. **Paraffin Wax** experiences a quietly steady trade at 2½d. per lb. **Potash Salts** remain generally steady, with **Bichromate** at 5¾d.; **Chlorate** in request at 4d.; and **Prussiate** rather dull at 1s. 3¼d.; all per lb. at Glasgow. **Salammoniac** indicates only quiet business at £60. and £57. for first and second lump respectively; crystals steady at £48. 10s. per ton. **Saltpetre** is £1. 9s. per cwt., but business is nominal at this reduced figure. **Sodium Bichromate** remains steady, with business on the basis of 4½d. per lb. **Chlorate** is quieter at 3¾d., while **Prussiate** continues in steady demand at 10½d. per lb. **Bicarbonate of Soda** is in good supply at £9. 15s. per ton, in 2cwt. bags; and £11. 10s. in 1cwt. kegs. **Tartar Emetic**, 43—44%, rather easier, and inclined to be dull at 1s. 1d. per lb. **Tartaric Acid** still shows a quiet tendency at 1s. 2¼d. per lb., less 5%, Glasgow.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

GLASGOW.

Week ending September 1.

AMMONIA (ANHYDROUS)—
Hamburg, 20 cylds.

BARIUM SULPHATE (BLANC FIXE)—
Hamburg, 24 pkgs., 15 cks.

BARYTES—
Antwerp, 1 brl.; Bremen, 76 cs.; Hamburg, 548 pkgs.

BLEACHING POWDER—
Hamburg, 2 cks.

CALCIUM CARBIDE—
Hamburg, 200 drms.

CAUSTIC POTASH—
Hamburg, 37 drms.

CHEMICALS (*otherwise undescribed*)
Hamburg, 26 drms.

CREAM OF TARTAR—
Marseilles, 100 cks.

DYESTUFFS (NATURAL)—
Cutch
Rangoon, 350 bxs.

GLUE—
Antwerp, 60 pkgs., 12 bls.

LEAD ACETATE—
Bremen, 45 cks.

LITHARGE—
Genoa, 44 cks.

LITHOPONE—
Antwerp, 20 cks.

MAGNESIUM CHLORIDE—
Hamburg, 107 drms.

MINERAL WAX—
New York, 55 bgs.

OCHRE—
Norfolk (Va.), 127 brls.

POTASH ALUM—
Hamburg, 15 cks.

SALAMMONIAC—
Hamburg, 74 cks.

SALT—
Bremen, 2,300 bgs.
Hamburg, 600 bgs.

SILICON (METAL)—
Baltimore, 50 kgs.

SOAP—
New York, 500 cs.
Philadelphia, 600 bxs.

SODIUM ACETATE—
Hamburg, 8 cks.

SODIUM SULPHATE—
Hamburg, 200 bgs.

SODIUM SULPHIDE—
Antwerp, 26 drms.
Hamburg, 5 drms.

STEARINE—
Montreal, 87 tres.
New York, 110 brls.

SULPHURIC ACID—
Hamburg, 5 pkgs.

WHITE LEAD—
Bremen, 78 cks.; Genoa, 51 cks.; Hamburg, 39 brls.

GOOLE.

Week ending September 1.

FORMIC ACID—
Hamburg, 80 crbys.

MAGNESITE—
Amsterdam, 50 bgs.

GRANGEMOUTH.

Week ending September 1.

CALCIUM CARBIDE—
Bergen, Trondhjem, and Aalesund, 1,200 drms.

CHEMICALS (*otherwise undescribed*)
Antwerp and Ghent, 28 brls.

FERRO MANGANESE—
Antwerp, 100 cs.

SOAP—
Antwerp and Ghent, 1 cs.

GRIMSBY.

Week ending September 1.

CHEMICALS (*otherwise undescribed*)
Antwerp, 1 brl.

DYESTUFFS (ARTIFICIAL)—

GLASGOW.

Week ending September 1.

AMMONIUM SULPHATE—
Mauritius, 200 t.

CHEMICALS (*otherwise undescribed*)
Adelaide, 3 pkgs.; Auckland, 270 pkgs.; Benkoelen, 150 pkgs.; Delagoa Bay, 1,770 pkgs.; Durban, 1,203 pkgs.; Dunedin, 2 pkgs.; Madras, 320 pkgs.; Mauritius, 45 pkgs.; Melbourne, 60 pkgs.; Monte Video, 29 pkgs.; Montreal, 635 pkgs.; Rouen, 298 pkgs.; Sydney, 219 pkgs.; Wellington, 95 pkgs.

CHROMIUM OXIDE—
Sydney, 2 c.

COAL TAR PRODUCTS—
Tar
Durban, 29 t. 15 c.; Helsingfors, 16 t.; Kotka, 4 t.; Mauritius, 3 t. 12 c.; Rouen, 4 t.
Unspecified
Gothenburg, 10 t. 16 c.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Lyttleton, 1 c.

DYESTUFFS (NATURAL)—
Logwood
Dunedin, 1 t. 1 c.

GLUE—
Montreal, 4 c.

MAGNESIA—
Gothenburg, 3 t.

PARAFFIN WAX—
Hamburg, 1 t.; Sourabaya, 50 t.

POTASSIUM BICHROMATE—
Calcutta, 1 t.; Delagoa Bay, 10 c.; Hamburg, 1 t. 3 c.; Lyttleton, 8 c.; Madras, 5 t.; Sydney, 11 t. 19 c.

SHEEP DIP—
Auckland, 5 t. 14 c.; Dunedin, 13 c.; Lyttleton, 1 t. 7 c.; Wellington, 2 t. 14 c.

SOAP—
Durban, 1 t. 2 c.

SODA ASH—
Adelaide, 10 c.

SODA CRYSTALS—
Auckland, 1 t. 17 c.

SODA CRYSTALS—
Chittagong, 3 c.

SODIUM BICHROMATE—
Adelaide, 1 t. 5 c.; Calcutta, 1 t. Dunedin, 1 t.; Hamburg, 19 c. Melbourne, 3 t. 16 c.; Sydney, 2 t. 17 c.

SPERMACETTI WAX—
Hamburg, 16 c.

SUPERPHOSPHATE—
Durban, 64 t. 10 c.

TALLOW—
Mauritius, 12 c.

WAX (*otherwise undescribed*)—
Melbourne, 15 t.

ZINC CHLORIDE—
Rouen, 6 t.

* Entered under the Safeguarding of Industries Act.

GRANGEMOUTH.

Week ending September 1.

AMMONIUM CHLORIDE—
Rouen, 5 t. 14 c.

BORAX—
Rotterdam, 2 t.

BORIC ACID—
Rotterdam, 3 t 4 c.

CAUSTIC SODA—
Riga, 4 c.

COAL TAR PRODUCTS—
Naphtha
Rouen, 1,122 galls.
Napthalene
Rotterdam, 20 t.
Tar
Reval, 84 t.

MAGNESIUM CARBONATE—
Antwerp, 10 c.

MAGNESIUM OXIDE—
Antwerp, 12 c.; Rouen, 2 t. 15 c.

PARAFFIN WAX—
Riga, 2 t.; Rouen, 2 t.

PITCH (*otherwise undescribed*)—
Christiansand, 10 t.

SHEEP DIP—
Christiansand, 3 c.

SOAP—
Christiansand, 1 t. 2 c.

HULL.

Week ending August 28.

AMMONIUM SULPHATE—
Naples, 1,010 bgs.

CHEMICALS (*otherwise undescribed*)
Antwerp, 267 drms.; Amsterdam, 18 cks., 180 drms.; Copenhagen, 7 cks., 22 drms.; Hamburg, 3,764 cks., 60 drms.; Harlingen, 10 drms.; Hango, 20 cks., 20 drms.; Helsingfors, 55 pkgs., 70 kgs.; Malmo, 1 ck., 15 drms.; New York, 20 drms.; Palermo, 2 cs.; Rotterdam, 2 cs., 2 cks., 43 drms.

COAL TAR PRODUCTS—
Pitch
Genoa, 100 cks.; Hamburg, 85 cks.; New York, 136 brls.

GELATINE—
Montreal, 50 bgs.

GLUE—
Malmo, 1 bg.
New York, 80 bgs., 14 cks.

GLYCERINE—
Copenhagen, 6 drms.
Amsterdam, 80 drms.
Hamburg, 30 drms.

LITHARGE—
Helsingfors, 17 cks.

MINERAL WHITE—
New York, 1,200 bgs.

SOAP—
Amsterdam, 500 cs.
Copenhagen, 1,013 cs.
Malmo, 12 bls.
Rotterdam, 243 cs.
Trieste, 40 kgs.

TANNING MATERIALS—
Unspecified
Leghorn, 120 bls.

TURPENTINE—
Copenhagen, 18 cks.

LEITH.

Week ending September 1.

ACETIC ACID—
Thorshavn, 2 cs.

AMMONIUM SULPHATE—
Alicante, 5,419 bgs.; Malaga, 5,419 bgs.; Tarragona, 5,419 bgs.

AMMONIUM CARBONATE—
Copenhagen, 10 brls.

COAL TAR PRODUCTS—
Tar
Gothenburg, 60 cks.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Antwerp, 3 cs.

GLUE—
Gothenburg, 108 pkgs.

IRON OXIDE—
New York, 185 cks.

MAGNESIA—
Amsterdam, 4 cs.

MAGNESIUM SALTS (*otherwise undescribed*)—
Montreal, 17 cs.

PARAFFIN WAX—
Amsterdam, 160 bgs.
Antwerp, 32 bgs.
Ghent, 816 bgs.

POTASSIUM BICHROMATE—
Gothenburg, 4 cks.

SOAP—
Thorshavn, 2 cs.
Trangisvaag, 6 cs.

TALLOW—
Rotterdam, 50 cks.

TANNIC ACID—
Rotterdam, 20 kgs.

LIVERPOOL.

Week ending August 28.

CALCIUM CHLORATE—
Melbourne, 82 pkgs.
Newcastle, 37 pkgs.

CASEIN—
Calcutta, 7 bgs.

CAUSTIC SODA—
Adelaide, 50 drms.; Amsterdam, 237 drms.; Arica, 24 pkgs.; Auckland, 84 drms.; Bari, 17 drms.; Bombay, 60 drms.; Bourgas, 3 drms.; Buenos Aires, 85 pkgs.; Cape Town, 45 drms.; Copenhagen, 6 drms.; Dalny, 101 drms.; Dunedin, 40 cs.; Durban, 380 drms.; Fiume, 7 drms.; Hamburg, 355 drms.; Hong Kong, 84 drms.; Kin Kiang, 50 drms.; Malta, 1 drm.; Madras, 250 drms.; Melbourne, 9 drms.; Moji, 41 drms.; Oporto 58 drms.; Padang, 20 drms.; Penang, 60 drms.; Reval, 315 drms.; Satang, 50 drms.; Stockholm, 60 drms.; Tegal, 36 drms.

FERRO MANGANESE—
New Orleans, 416 t.

GLUE, SIZE, AND GELATINE—
Boston, 41 pkgs.
Dalny, 60 pkgs.
East London, 25 pkgs.
Melbourne, 10 cks.

PARAFFIN WAX—
Talcahuano, 267 bgs.
Trinidad, 80 brls.

SALT—
Accra, 2 t.; Antwerp, 200 t.; Auckland, 127 t.; Bombay, 8 t.; Bonny, 10 t.; Buenos Aires, 100 t.; Burutu, 20 t.; Calabar, 358 t.; Cape Palmas, 26 t.; Cotonou, 17 t.; Duala, 211 t.; Durban, 4 t.; Egwanga, 10 t.; Gothenburg, 7 t.; Halifax, N.S., 237 t.; Havre, 6 t.; Helsingfors, 110 t.; Iddo, 244 t.; Koko, 4 t.; Lagos, 115 t.; Livingston, 49 t.; Melbourne, 50 t.; New Orleans, 305 t.; New York, 200 t.; Norrkoping, 70 t.; Opobo, 10 t.; Pt. Antonio, 5 t.; Victoria, W.C.A., 10 t.

SOAP—
Abonema, 100 pkgs.; Aden, 30 pkgs.; Alexandria, 275 pkgs.; Amboina, 1,000 pkgs.; Amoerang 200 pkgs.; Antwerp, 576 bxs.; Antofagasta, 5 bxs.; Auckland, 840 bxs.; Arica, 25 pkgs.; Antigua, 160 pkgs.; Bandjermassin, 926 bxs.; Bangkok, 266 pkgs.; Banjoewangie, 100 bxs.; Barbados, 454 pkgs.; Batavia, 3,615 pkgs.; Batjan, 80 bxs.; Beira, 24 pkgs.; Belawan, 1,420 bxs.; Bombay, 4,294 pkgs.; Boston, 3 cs.; Bourgas, 745 cs.; Buenos Aires, 1,052 pkgs.; Calabar, 278 pkgs.; Calcutta, 252 pkgs.; Callao, 6 pkgs.; Cape Coast, 350 pkgs.; Caracas, 2 pkgs.; Colon, 365 pkgs.; Colombo, 143 pkgs.; Corral, 5 pkgs.; Copenhagen, 250 bxs.; Curacao, 313 pkgs.; Cotonou, 35 pkgs.; Demerara, 8 bxs.; Djambi, 416 pkgs.

SOAP—
Duala, 1,250 bxs.; Dunedin, 342 bxs.; Durban, 248 bxs.; Egwanga, 100 pkgs.; Fernando Po., 65 pkgs.; Gisborne, 5 pkgs.; Gorontalo, 170 bxs.; Grand Bassa, 21 pkgs.; Grand Bassam, 65 bxs.; Grenada, 50 bxs.; Hong Kong, 250 bxs.; Iddo, 4 pkgs.; Karachi, 590 bxs.; Khota Radja, 100 bxs.; Kilindini, 223 bxs.; Kingston (Jam.), 150 bxs.; La Libertad, 35 pkgs.; Las Palmas, 130 bxs.; Langsa, 5 pkgs.; Lho Seumaweh, 100 pkgs.; Liroeng, 15 pkgs.; Limon, 35 pkgs.; Lome, 55 pkgs.; Malta, 26 pkgs.; Macassar, 1,075 bxs.; Madras, 683 pkgs.; Mauritius, 210 bxs.; Melbourne, 71 cs.; Matadi, 20 bxs.; Menado, 1,250 bxs.; Merauke, 100 bxs.; Mombasa, 324 pkgs.; Monrovia, 55 cs.; Montserrat, 60 cs.; New York, 5 pkgs.; Olchleh, 25 bxs.; Oratava, 56 bxs.; Pangkalen Brandon, 50 bxs.; Pankal, Penang, 100 bxs.; Paramaribo, 119 pkgs.; Pasir, 40 bxs.; Penang, 597 pkgs.; Petta, 40 bxs.; Piraeus, 47 pkgs.; Pontianak, 310 bxs.; Pt. Swettenham, 14 c., £16.; Rangoon, 2 t. 14 c., £145.; St. Lucia, 4 c., £6.; Singapore, 1 t. 18 c., £58.; Syra, 3 c., £5.; Trinidad, 15 c., £21.

DYESTUFFS (ARTIFICIAL)
Alizarine
Wellington (F.), 1 kg., £7.
Unspecified
Auckland, 1 cs., £13.; Calcutta, 1 cs. (pt.), £17.; Colombo, 2 cs. (pt.), £6.; Demerara, 2 cs. (pt.), £10.; Durban, 7 pkgs., £197.; Manila, 1 cs., £61.; Montreal, 2 cs. (pt.), £56.; New York, 1 cs. (pt.), £8.; Penang, 1 cs., £6.; Wellington, 5 kgs., £72.; Wellington (F.), 19 kgs., £557.

FERTILISERS (*otherwise undes.*)—
Aarhus, 10 c., £13.; Christiania, 3 t., £75.; Copenhagen, 2 t. 10 c., £63.; Grimstad, 2 t., £50.; Stockholm, 2 t., £50.

GALLIC ACID—
Bilbao, 1 cs. (pt.), £20.

GLYCERINE (CRUDE)—
Amsterdam (F.), 7 t. 2 c., £320.
Hong Kong, 1 c., £5.
New York, 50 t., £2,345.

HYDROFLUORIC ACID—
Auckland, 2 brls., £7.

HYDROGEN PEROXIDE—
Alexandria, 2 cs., £12.

IODIDES (*otherwise undescribed*)—
Montreal, 1 cs. (pt.), £24.

IODINE—
Calcutta, 2 cs. (pt.), £79.

IODINE (RESUBLIMED)—
Buenos Ayres, 2 cs., £221.
Christchurch, 1 cs., £27.
Sydney, 10 cs. (pt.), £50.

IRON AMMONIUM CITRATE—
Montreal, 2 cs., £21.
Toronto, 1 cs., £11.

KIESELGUHR—
Paris (F.), 4 t. 18 c., £50.

LEAD NITRATE—
Rouen, 10 cks., £87.

MAGNESIA—
Napier, 10 cs., £24.
Valparaiso, 2 cs., £50.

MAGNESIA (CALCINED)—
Vera Cruz, 2 cs., £18.

MAGNESIUM CARBONATE—
Vera Cruz, 8 cs., £31.

MAGNESIUM CITRATE—
Limon, 1 cs., £5.

MAGNESIUM HYDRATE—
Alexandria, 5 cs. (pt.), £11.

MAGNESIUM SULPHATE—
Auckland, 8 t. 2 c., £191.; Bombay, 13 c., £16.; Colombo, 1 t., £14.; East London, 4 c., £5.; Montreal, 8 c., £6.; Napier, 1 t. 15 c., £41.; Toronto, 11 c., £13.; Wellington, 1 t. 8 c., £22.

MANGANESE OXIDE (HYDRATED)—
Genoa, 2 cs., £27.

MERCURIALS (*otherwise undes.*)—
Melbourne, 1 cs. (pt.), £21.
Montreal, 1 cs. (pt.), £11.

PHOSPHATE OF LIME—
Dunkirk, 10 kgs., £34.

PLATING SALTS (*otherwise undes.*)
Switzerland, 1 cs., £27.
Wellington, 1 ck., £6.

POTASSIUM BICARBONATE—
Toronto, 2 cks., £6.

POTASSIUM CARBONATE—
Antwerp, 4 cs., £8.

POTASSIUM CITRATE—
Calcutta, 1 cs., £13.; Melbourne, 1 cs. (pt.), £6.; Montreal, 1 ck., £10.; Sydney, 10 cs. (pt.), £64.

POTASSIUM CYANIDE—
Switzerland, 1 cs., £16.
Wellington, 1 cs., £24.

POTASSIUM IODIDE—
Alexandria, 2 cs., £169.; Calcutta, 2 cs., £176.; Christchurch, 1 cs., £88.; Canton, 1 cs. (pt.), £10.; Colombo, 4 cs. (pt.), £22.; Oruro, 1 cs. (pt.), £6.; Sydney, 10 cs. (pt.), £330..

POTASSIUM METABISULPHITE—
Oporto, 2 kgs., £10.

POTASSIUM PRUSSIATE—
Bombay, 5 kgs., £32.

PYROGALLIC ACID—
Paris, 3 cs., £120.

SALAMMONIAC—
Athens, 4 cks., £12.
Syra, 3 cks., £8.

SALICYLIC ACID—
Demerara, 1 cs., £6.

SALTPETRE—
Bahia, 1 t., £39.
Pernambuco, 1 t., £39.
Wanganui, 10 c., £20.

SHEEP DIP—
Napier, 15 t., £629.

SILVER NITRATE—
Hong Kong, 1 cs., £77.

SODIUM ARSENITE—
Delagoa Bay, 1 t., £73.

SODIUM BICARBONATE—
Bombay, 2 c., £6.; Cape Town, 5 c., £7.; Colombo, 1 t. 10 c., £24.; East London, 14 c., £20.; Montreal, 7 c., £19.; Oporto, 10 c., £28.; Santander, 9 c., £32.; Toronto, 8 c., £7.

Penang, 1 t., £21.

SODIUM CARBONATE—
Antwerp, 1 t., £14.; Christiania, 10 c., £8.; Leghorn, 1 t., £15.

SODIUM CITRATE—
Montreal, 1 ck., £8.

SODIUM HYPOCHLORITE—
Brussels, 1 c., £5.

SODIUM HYPOSULPHITE—
Hong Kong, 1 t., £15.
Wellington, 4 cs. (pt.), £68.

SODIUM IODIDE—
Calcutta, 1 cs. (pt.), £25.

SODIUM PYROPHOSPHATE—
Leghorn, 3 t. 1 c., £108.

SODIUM SALICYLATE—
Christchurch, 1 c., £13.
New Plymouth, 1 cs. (pt.), £7.

SODIUM SILICATE—
Durban, 15 c., £23.

SODIUM SULPHATE—
East London, 11 c., £6.
Trinidad, 1 t. 2 c., £15.

SODIUM SULPHITE—
Antwerp, 15 c., £17.

SODIUM TARTRATE—
Brussels, 4 c., £17.

SULPHUR—
Trinidad (F.), 10 c., £6.

SULPHURIC ACID—
Antwerp, 15 c., £10.; Antofagasta, 10 c., £10.; Barbados, 5 c., £6.; Sekondi, 4 c., £88.

SUPERPHOSPHATE—
Durban, 12 t. 9 c., £95.

TARTARIC ACID—
Adelaide, 1 t. 10 c., £226.; Bombay (F.), 1 t., £130.; Brisbane, 1 t. 13 c., £209.; Bucharest, 2 c., £17.; Calcutta, 1 c., £9.; Chi tobal (F.), 1 c., £9.; Delagoa Bay, 1 c., £9.; Dunedin, 1 t. 3 c., £147.; Durban, 2 c., £16.; Hong Kong, 1 c., £7.; Limon, 1 c., £7.; Melbourne, 10 t. 10 c., £1,292.; Perth, 6 c., £37.; Rotterdam (F.), 1 t. 10 c., £260.; Singapore (F.), 5 c., £32.; Stockholm, 2 c., £15.; Sydney, 1 t., £123.; Valparaiso, 5 c., £39.; Wellington, 2 c., £12.

THEOBROMINE SALTS (*otherwise undescribed*)—
Calcutta, 1 cs. (pt.), £5.

THORIUM NITRATE—
Copenhagen (F.), 1 cs., £69.

TIN OXIDE—
Brussels, 3 cks., £62.

TIN SALTS (*otherwise undescribed*)
Valparaiso, 6 cs., £51.

ZINC OXIDE—
Alexandria, 20 cks., £115.
Pt. Madryn, 1 ck., £5.
Pt. Swettenham, 3 pkgs. (pt.), £9.

Week ending September 1.

ANTIMONY REGULUS—
Danzig, 2 t.

ATOMIC STRUCTURE AND ATOMIC ENERGY.

SIR Ernest Rutherford's presidential address to the British Association on Wednesday night, whilst containing nothing fundamentally new, presented the whole subject of the electrical structure of matter in an exceptionally concise and intelligible form. It may now be taken as definitely proved that the fundamental units of atomic structure are the electron, the ultimate particle of negative electricity, and the proton, its corresponding analogue of positive electricity. The possibility does exist, as Sir Ernest pointed out, that future inquiry may some day show that these units are complex, and divisible into even more fundamental entities, but this is far from likely. The epoch-making work of modern physicists has given us an illuminating insight into the manner in which these units are built up and arranged to form the structure of the atoms of all the chemical elements. The atom may be regarded as a miniature solar system—although the analogy must not be pressed too far—in which rapidly rotating electrons take the place of the planets, and a nucleus corresponds to the central sun. The chemical and physical properties of an atom are functions of the number, arrangement, and relative motions of its planetary electrons, whilst its mass and radio-active properties are bound up entirely with the nature of the nucleus. The electron itself has been comparatively easy to isolate and study, so that modern knowledge of this fundamental unit is fairly extensive. With regard to the proton, however, quite a different state of affairs prevails, and although it is highly probable that the charged hydrogen atom consists of, and is identical with, the proton, such has not been definitely proved. Study of the proton, and of the manner in which protons are assembled to form atomic nuclei constitutes indeed one of the most difficult problems confronting modern science. It is known that although the negative electrical charge of the electron and the positive charge of the proton are quantitatively identical, yet the mass of the proton is infinitely smaller than that of the electron. Explanation of this striking difference in mass is not easy, but Sir Ernest Rutherford expressed his opinion that, were it not for this difference, matter—as we now know it—could not exist. Sir Ernest had some

interesting things to say about atomic energy. For the past decade or so, both the scientific and layman alike have been fascinated by the possibility of releasing and utilising industrially the tremendous forces locked up in the interior of the atom. It is doubtful, however, that such a project will ever be realised. It has been found absolutely impossible by the most powerful laboratory agencies to alter in the slightest degree the rate of disintegration of the radio-active elements. When these latter have reached a stage of nuclear stability, the energy then contained in the nucleus—of whatever magnitude it may be—is forever beyond our control. This, at least, is the opinion held by physicists to-day. By the employment of suitable forces, it is true, the outer planetary electrons may be caused to move slightly from their orbits of maximum equilibria, and, in returning, to liberate energy; but this energy is by no means comparable in magnitude to that liberated by nuclear radio-active disintegration. The conversion of hydrogen into helium in which process four hydrogen nuclei condense to form one helium nucleus is also an operation involving, theoretically, huge energy release; but in this case also no experimental evidence has yet been obtained to prove that such a synthesis can ever be carried out.

AN EXCESS OF ZEAL.

The Customs and Excise authorities of this country usually exercise a certain amount of discretion in the performance of their duties, and do not insist too emphatically on the strict letter of the law. Unfortunately, their lapses from such a commonsense attitude have been increasingly frequent within recent years, a state of affairs to which testimony can readily be borne by many chemical importers and exporters. Within the last few months several cases have come to our notice in which a rather unreasonable attitude has been adopted by the Customs authorities, and one which has occurred during the last week or so is typical of the rest. A firm of merchants imported a number of drums of commercial formaldehyde into this country. This formaldehyde, in addition to its usual content of methyl alcohol, contained also an appreciable percentage of ethyl alcohol, and the whole consignment is being held up by the Customs until the full duty on the ethyl alcohol has been paid. Notwithstanding the fact that the alcohol is absolutely impotable and cannot be recovered from the formaldehyde by any commercially practicable process, the authorities are standing fast in their refusal to release the material until payment has been made. In this particular case the amount demanded as duty is more than the actual value of the consignment, and it appears that the only course open to the importers will be to re-ship the formaldehyde and cut their losses. Although the Excise authorities reserve to themselves the right to determine whether methyl alcohol in admixture with other substances shall or shall not be dutiable, it has been customary to pass, as "duty-free," methyl alcohol contained in commercial formaldehyde, and it is difficult to see why a similar line of action should not be adopted in the case of ethyl alcohol. The latter product is present as a preservative for the formaldehyde, and is used doubtlessly because it is cheaper than the methyl alcohol. We are not dealing at the moment with the broad question of whether the free importation of formaldehyde is or is not to the best interests of the country. Our attitude on this point was expressed clearly some weeks ago in reference to the referee's decision. Whilst, however, the law remains in its present state, formaldehyde can be imported freely, and it is manifestly absurd to tax its ethyl-alcohol content as potable spirit.

SULPHURIC-ACID PRODUCTION.

The official statistics on the output of the British sulphuric-acid industry during the year ended June 30 last make rather encouraging reading. During the period under review the total production of all strengths of acid, including oleum, expressed as 70 per cent. sulphuric acid, was 1,225,000 tons, an increase of 340,000 tons over the 1921-1922 figure, but a reduction of 745,000 tons against the maximum war-figure of 1917. In terms of plant capacity the 1922-1923 output represents 62 per cent. of the available total, an appreciable increase over the 48 per cent. of 1921-1922. In a normal pre-war year such as 1913, the sulphuric-acid output represented the utilisation of about 85 per cent. of the available plant capacity, and the present figure is still too low to allow manufacture on the most economical basis. An examination of the raw materials used in the process is also not without interest. The consumption of spent oxide as a source of sulphur is growing steadily, the amount used in the year 1922-1923 being 157,000 tons against 129,000 tons in 1921-1922 and only 110,000 tons in 1913. With the diminution in the stocks of this material which accumulated in the years immediately following the war, however, a decline in the consumption may be anticipated in the near future. The official figures confirm the growing importance of sulphur even in the working of chamber plants and the consequent diminution in the amount of pyrites used. Thus in the year 1922-1923 45,000 tons of sulphur were burnt, an amount which was not exceeded in 1917 when the acid production was mainly oleum, and over 50 per cent. above last year's figure. With regard to pyrites, the consumption figures for the years 1922-1923, 1921-1922, 1917, and 1913 were 365,000 tons, 358,000 tons, 871,000 tons, and 800,000 tons. Whether in view of the recent agreement amongst pyrites producers, the mineral will regain its pre-war ascendency as a source of sulphur for acid manufacture, is, to say the least, problematical. The fertiliser industry is still responsible for the consumption of the major portion of the sulphuric acid produced, the superphosphate and sulphate-of-ammonia industries alone accounting for over half of the total production, whilst the dyestuffs industry consumes under 3 per cent. of the output.

THE MODERN ADHESIVES INDUSTRY.*

A SUMMARY OF TECHNICAL PROGRESS.

By "Investigator."

ALTHOUGH animal glues have been known from the very earliest times, only in recent years have attempts been made to systematise knowledge on the subject. Recently, the need for water-resistant glues, especially for aeroplane construction and propeller work, has led to the development of casein products, and attempts have also been made to eke out supplies of animal glues by the introduction of vegetable products prepared from soluble starch. With a view to obviating the use of the costly ester gums, attention has been given to dextrin-like materials. Many industrial vegetable offals have been utilised in order to conserve food materials, while the consumption of sodium silicate adhesives now runs into many thousands of tons per annum.

The Extraction of Animal Glues.

Described briefly, a 20 per cent. crude glue solution is obtained from bones by the following process: The crushed material is first freed from fat (12 to 18 per cent.) by repeated hot extraction with petroleum or shale oil distillates (boiling point 100°–115° C.), in batteries of extractors provided with condensers. The de-fatted and solvent-free residue is sifted in rotating cylindrical screens and then "cooked" with water in autoclaves, first under 15lb. and finally under 5lb. pressure, to facilitate the exudation of the glue.

"Osseine" is the residual product after extracting the mineral matter from bones. By treating this with hot water, glue can readily be prepared. Another procedure, which avoids the deleterious effect of heating, is to treat the phosphate-freed bones with pepsin in order to hydrolyse the proteins, and so render them soluble. Decomposition of the fats is avoided by working in an acid medium (*Ger. Pat.* 345,775, of 1918).

Hide stock and animal refuse are shredded, after washing to remove salt and dirt, and then unhaired and de-fatted ("limed"), by repeated treatments with milk of lime, the process extending over several weeks. After scraping, the swollen material is washed with water and dilute hydrochloric acid, put into sacks, and a 32 per cent. glue liquor extracted by treatment with water and steam at 80° C. For pale glues the lime should be free from iron.

Glue can be extracted from fish offals by methods similar to those used for bone glue. According to a recent specification, the offal is freed from mineral matter by treatment with hydrochloric acid (10 per cent.), the neutral residue bleached with zinc hydrosulphite, neutralised with lime water, and then "cooked." (*Brit. Pat.* 153,526, of 1920.)

The warm glue extracts obtained by any of the foregoing processes are clarified by standing in tanks, any residual grease is separated, and the liquor strained at 80° C. Clarification is usually accelerated by adding ½ per cent. of alum. Owing to hydrolysis of the latter, sulphuric acid remains in the glue, and this may lead to serious deterioration. After concentrating under reduced pressure, the residue is bleached in lead-lined tanks by means of sulphur-dioxide gas, and allowed to set in galvanised iron troughs, thinly coated with oil or paraffin, or on water-cooled glass slabs. Bleaching is sometimes effected by charcoal alone, or in combination with kieselguhr. The drying, to a water content of 10–13 per cent., is a delicate operation, and is carried out in chambers, under regulated conditions of temperature and humidity.

Modern Developments in Glue Manufacture.

A recent proposal is to utilise the colloid mill for both glue extraction and de-fatting, the order of the operations being the reverse of the usual (*Ger. Pat.* 344,238, of 1921). In order to shorten the "liming" process, the use of the Twitchell and other fat-splitting catalysts, in alkaline media, has been suggested (*Ger. Pat.* 365,448, of 1921), while Röhm claims to be able to eliminate this lengthy process altogether by a short treatment with pancreatic and similar enzymes (*Brit. Pat.* 104,181, of 1916).

Concentration of the glue liquors is usually carried out in multiple-effect evaporators at as low a temperature as possible, so as not to injure the adhesiveness of the finished product. In another method, a fine rain of glue liquor is distributed from a revolving plate on to the corrugated walls of a column, down which it flows, meeting a counter-current of warm air (*Ger. Pat.* 323,845, of 1917). Thin films of glue can also be obtained by the use of heated revolving rollers, the dried film being continuously scraped off. An interesting procedure is that of simultaneous purification and concentration by electro-osmosis. The glue extract is subjected to a potential difference between diaphragms, when the glue is coagulated, leaving the mineral matter dissolved in the liquid (*Brit. Pat.* 21,448, of 1914).

Glue from Chrome Leather Waste.

Among processes for utilising chrome leather scrap may be mentioned preliminary digestion with aqueous caustic soda (*U.S. Pat.* 1,285,474, of 1918), with solutions of Rochelle salt or salts of other hydroxyacids (Procter), with sodium peroxide and 2 per cent. sodium bisulphate at 45° C. Usually, the insoluble basic chromium compounds in the leather are converted into soluble salts. Thus, Rochelle salt forms soluble double tartrates, bisulphates form the soluble normal sulphate, while sodium peroxide gives rise to sodium chromate, which is recovered as such.

Composition and Properties of Animal Glues.

Animal glues are the products of hydrolysis of various nitrogenous tissue substances, known collectively as collagens. (The process can be reversed by dehydration). They consist chiefly of glutin, together with minor amounts of the less adhesive chondrin and mucin. Fish glues differ from animal glues in having a lower content of the amino-acids proline, oxyproline and tryptophane. Glutin (nitrogen content 18 per cent.), can be obtained ash-free by precipitation with alcohol. It is soluble in acetic and mineral acids and is not precipitated by salts such as alums, lead acetate or ferric chloride, differing in both these respects from chondrin. A delicate test for glutin is the formation of a brown precipitate with platinum salts. Tannic acid and formaldehyde both combine with animal glue, the former giving rise to a leather-like substance, while the formaldehyde compound has been utilised as an artificial silk.

The colloid content of glue solutions has been estimated by filtering dilute solutions (0.1 per cent.) through fibrous alumina. Values of 92.8 and 72.0 per cent., calculated on the total solids, were obtained for a first grade hide glue and for a photographic gelatin, respectively, these values being directly related to the adhesive power. Owing to the presence of gelatin-degradation products, such as peptones, gelatin (glutin) determinations by direct Kjeldahl method give misleading results. Such estimations should be made by precipitating the gelatin with tannic acid solution, previously standardised against pure gelatin. According to Bogue (*Chem. and Met., Eng.*, 1920), the strongest joint is given by glues with the highest content of unhydrolysed gelatin. The same investigator supports the "streptococcic" theory of glue constitution, in accordance with which, the glue consists of string-like formations of protein aggregates.

The Sterilisation of Glues.

To prevent the growth of liquefying bacteria in glues, the following concentrations (parts per litre) of antiseptics will suffice:—sulphurous acid 0.15, sulphuric acid 0.30, 40 per cent. formaldehyde 1.5, and phenol 15.0. The highly efficient sulphurous acid acts also as clarifier and decolouriser. These additions will not, however, prevent the growth of moulds in gels weaker than 40 per cent., but a gel of this concentration and above will remain free from moulds in a moist atmosphere. Sodium hypochlorite, salicylic acid, clove oil and thymol have also been used. In the case of hypochlorite, the liquefied glue is treated with twice its volume of a solution containing 3 grammes of available chlorine per litre (*Ger. Pat.*, 313,141, of 1917).

To determine free SO_2, the solution should be titrated with N/10 iodine in the usual way. Hide or leather glues, in which the SO_2 is usually combined with lime, are treated with phosphoric acid and distilled in a current of steam and CO_2. The SO_2 is oxidised in iodine solution and then precipitated as $BaSO_4$ in the usual way. Any formaldehyde is collected in Schiff's reagent (Gutbier, *Kolloid Zeit.*, 1921).

Viscosity, Adhesiveness, and Tensile Strength.

According to Bogue (*Loc. cit.*), the viscosity values, as determined in the MacMichael rotating viscometer, are directly related to the melting point, gelatin content, and joint strength. The values are referred to the viscosity of the 20 per cent. solution at 32° C. From the viscosity-temperature curve, the melting point can be obtained by

* See also the Report of the Adhesives Research Committee, *The Chemical Trade Journal and Chemical Engineer*, August 4, 1922.

extrapolating to the point of non-fluidity. Gelatin content, and hence the strength of the joint in practice are stated to be directly connected with the melting point. At temperatures well above the latter point, the viscosity increases logarithmically with the concentration. Prolonged heating and vigorous agitation diminish the viscosity, an effect frequently observed on breaking down colloidal structures by "working." On adding formaldehyde or alums, the viscosity is raised, but electrolytes do not appear to follow any definite rule in this respect.

Rudeloff (*Mitt. K. Materialprüf.* 1918) has found the most suitable conditions for testing the adhesiveness to be as follow: ratio glue to water, 2:3 (calculated on the dry weight at 100° C.); the wood pieces to be heated to 40° C. in dry air; the glue film to be dried under a pressure of 0.84 kilo per sq. cm. This investigator found that the adhesiveness of the glue film is not strictly proportional to the glue concentration, and that this property is also influenced by the temperature to which the wood is heated and by the pressure applied during the drying of the joint.

The average tensile strengths of three ordinary glues, determined on thin strips (0.1 inch), cast from the molten glue, are given as 13.2, 8.5, and 11.5lb. per square inch (Hopp, *J. Ind. Eng. Chem.*, 1920). Another method employs the torsion dynamometer on cylindrical test pieces (Sheppard, *J. Ind. Eng. Chem.*, 1920). The conclusion was reached that there was no simple relation between the concentration and the tensile strength, nor between the latter and the strength of the dry glued joint.

The acidity of glue is usually determined on a 1 to 6 per cent. solution with N/10 NaOH, using phenolphthalein, rosolic acid, or fluorescein as indicators. The latter is especially useful with dark glues. For free mineral acid alone, alizarin should be used. Hide glues are generally neutral or slightly alkaline. Bogue (*Loc. cit.*) recommends the hydrogen-ion concentration, viscosity at 60° C., consistency of the jelly, absence of foam, grease or odour, and appearance as the most suitable tests of quality and further asserts, that a high melting point affords a true index of the actual strength in service.

The Preparation of Liquid Glues.

A solution of glue loses its gelatinising power when mixed with acetic, nitric or hydrochloric acid, or when heated with zinc chloride. This property is utilised for preparing glues with low setting points, such adhesives having obvious advantages over solid compositions. Thus, the solution in acetic acid is the basis of some well known liquid adhesives ("seccotine" and "diamond cement.") Additions of calcium salicylate, thiourea, alkali sulphonates, soluble formates and formic acid have also been proposed with the same end in view. According to the Schütte-Lanz Airship Company, glues containing the latter two substances can be cooled below 0° C. without setting. (*Ger. Pat.*, 325,246, of 1917). Another liquid adhesive consists of animal glue "swelled" with carbon tetrachloride (*Ger. Pat.*, 345,601, of 1920). Channon claims non-setting properties (at 21° C.) and good penetrating power for wood, for a complex mixture, the main ingredients of which are ordinary glue, phosphoric acid, phenol and water (*Brit. Pat.*, 122,807, of 1918). In order to render glue soluble without warming, the finely-powdered material is incorporated with about one-third its weight of calcium chloride (*U.S. Pats.*, 1,300,096-7, of 1919).

Water-resisting Adhesives with Casein Basis.

The water-resistant property of casein and similar albuminous adhesives is conditioned by their limited water absorption, the glue, when saturated, having still sufficient strength to hold. Casein compositions do not require to be heated for coagulation and so can be applied cold. Owing to their poor-keeping qualities, these mixtures are kept dry until ready for use. They are usually made by treating fat-free casein with an alkali and a preservative. When hydrated lime is used, "lime binding salts" are frequently added—*e.g.*, fluoride, silicate, sulphite and phosphate of sodium. The composition of some casein glues is shown in the following examples:-

	U.S. Pat. 1,291,336/'19.				Brit. Pat. 148,216/'20.
	Parts.	*Parts.*	*Parts.*	*Parts.*	*Parts.*

An aircraft adhesive, giving good results on immersion in water, consists of 66 per cent. casein, 23 per cent. mineral matter (lime, sodium salts, silica, and alumina), and 1 per cent. petroleum, the remainder being water. It is claimed that the water-resisting property is improved by adding 1.5 per cent. of barium peroxide (*Ger. Pat.*, 345,684, of 1920). Another procedure is to evaporate, at low temperatures, a solution of the lime compound of casein and to incorporate lime with the residue. Casein dissolved in a cuprammonium solution constitutes another adhesive (*U.S. Pat.*, 1,244,463, of 1917), while a more complex composition is made by incorporating a 5 per cent. solution of camphor in castor oil with casein, barium sulphate, lime and soda ash (*Brit. Pat.*, 131,400, of 1918).

Waterproof Glue from Oil Seed Residues.

According to O'Gorman and Schryver, the proteins isolated from castor-bean and hempseed residues can be utilised. These are treated with magnesium or calcium hydroxide, and certain alkali salts, such as the fluoride or arsenate of sodium, capable of slowly reacting with the bases, with the liberation of caustic soda. The resulting product is mixed with dilute NaOH (*Brit. Pat.*, 140,911, of 1919).

Blood albumen, made by removing the fibrin and part of the hæmoglobin from blood, constitutes the basis of another class of water-resistant adhesives. A satisfactory product can be prepared by soaking black blood albumen (10 parts) in water (18 parts), straining, and then treating the liquid with a little lime or ammonia. Members of this group differ from casein adhesives in that they must be applied hot, as hardening depends on coagulation by heat (above 74° C.). The Schütte-Lanz Aircraft Company treat fresh blood with oxalic acid or sodium citrate and evaporate *in vacuo* to prevent coagulation. The residue is then dissolved in a small quantity of water, and rendered alkaline (*Brit. Pat.*, 169,509, of 1920).

Attempts have been made to confer water-resisting qualities on ordinary animal glues, by rendering them insoluble by means of formaldehyde. Thus the surfaces to be glued together are first treated with formalin and then with the glue. An ingenious procedure is to treat the glue with the loose compound of albumin and formaldehyde. The heating, necessary in making the joint, serves to liberate formaldehyde, which then renders the glue insoluble (*Ger. Pat.*, 317,963, of 1918). The addition of alum and formaldehyde to liquid glue containing a formate, is claimed to render the glue insoluble after coagulation (*Ger. Pat.*, 328,692, of 1917).

Vegetable Glues from Starch.

The high cost of ester gum adhesives of the gum arabic type has led to the introduction of modified starch gums such as dextrin. Partial hydrolysis of the starch is usually brought about by heating with hydrochloric or nitric acid (0.2-0.4 per cent.) at 150° C. until the acids are volatilised; or the material is roasted at 180°-200° C. in drums provided with agitators, and the product decolourised with charcoal. A disadvantage of dextrin-coated materials is that they tend to become moist in wet weather. The addition of an equal weight of calcium chloride to dextrinised starch, free from glucose, is said to render the product non-tacky when cold (*U.S. Pat.*, 1,337,382, of 1920).

Within the last few years, a large number of processes have been evolved with the object of preparing a technically valuable vegetable glue. Most of these processes are based on the action of alkali on starch. The products are excellent adhesives, but they gradually coagulate on keeping. In one process, a cream of starch and water is gelatinised by heating and the product then treated with a base (*U.S. Pat.*, 1,396,315, of 1921). Another procedure is to treat a mixture of tapioca starches with barium hydroxide (0.1-0.25 per cent.). Alkali phenolates, persalts and sodium peroxide are also applicable—*e.g.*, a paste consisting of potato flour (100 parts), ammonium persulphate (2.5 parts) and 22° B. ammonia (1 part), gives a good adhesive after standing one hour (*Brit. Pat.*, 179,765, of 1921). To avoid the injurious action of strong alkali on materials in use, the glue may be neutralised by treatment with SO_2 or CO_2. Water-resistance can be imparted by treating the vegetable glue with zinc chloride, cuprammonium sulphate, casein, resinates or aluminates. According to the Bayer Company, a colourless adhesive, equal to animal glue, can be obtained by heating a starch solution with formaldehyde (*Ger. Pat.*, 318,957, of 1913).

Other starch adhesives are prepared by treating gelatinised starch with hexamethylenetetramine, and by heating and emulsifying starch with a mixture of water and waxes (*U.S. Pats.*, 1,287,841, of 1918, and 1,311,964, of 1919). An interesting adhesive consists of the alkali salts of starch fatty acids, prepared by the action of chlor-fatty acids on starch or dextrins in the presence of alkali (*Ger. Pat.*, 360,651, of 1920).

Adhesives from Cellulose Waste Materials.

The waste liquors from sulphite-pulp manufacture have been utilised as a source of adhesives. In one process the strongly acid liquors deposit adhesive solids on exposure to air; or the mixture is partially neutralised with lime or calcium carbonate and evaporated down (*U.S. Pats.*, 1,311,215-1,311,222, of 1919). In order to improve the colour and adhesiveness, the liquors can be evaporated under reduced pressure with the addition of lead acetate, sodium hydrosulphite or sodium phenolate; or the evaporation is carried out in the presence of organic bases, acids or aldehydes (*Ger. Pat.*, 334,870, of 1918). Water-resisting qualities can be imparted by incorporating casein or resinates. Thus, cellulose pitch (5 parts) is treated with magnesium oxide (2 parts), and the product is incorporated with casein (2.5 parts) and sodium fluoride (1 part) (*Ger. Pat.*, 353,570, of 1919).

With a view to obtaining adhesives from straw (*Ger. Pat.*, 315,536, of 1918), maize cobs (*U.S. Pats.*, 1,285,247, of 1918, and 1,317,380, of 1919, and lupin seed husks (*Ger. Pat.*, 309,650, of 1917), these materials are extracted with water or dilute alkali. The colloidal extract is then separated from the residue under pressure and concentrated or neutralised if necessary. Another patent proposes to treat finely-divided lignite with caustic soda solution for the same purpose (*Ger. Pat.*, 324,928, of 1918).

Sodium Silicate Adhesives.

The consumption of these adhesives now reaches very large proportions, especially for cartons, labels, corrugated cardboard and other paper stock products. It also finds application as an adhesive for abrasive silicate wheels, which consist of a baked mixture of abrasive, clay and sodium silicate. Commercial sodium silicate consists of a colloidal solution of SiO_2 in $Na_2O.SiO_2$ or $Na_2O.2SiO_2$ or in both. For its preparation a solution of "soluble glass" is concentrated after allowing impurities to settle out. Adhesive solutions generally contain about 20 per cent. water. Their viscosity can be regulated to suit the nature of the surface to which they are to be applied.

Solutions of high silica content, when cooled or concentrated by evaporation or absorption, gradually increase in viscosity until the point of gelation is reached, when there is a very marked rise. This sudden change to jelly occurs with a loss of only one per cent. of moisture, making the adhesive set very rapidly and allowing high-speed spreading machinery to be used. The bond is not released by warming and is of sufficient strength—that is, it is stronger than the tensile strength of paper and paper stock. To ensure good results, the temperature and relative humidity in the spreading rooms must be regulated. Owing to their high alkalinity, these adhesives tend to discolour paper and cardboard and to attack printed and coloured labels. The latter tendency can be overcome by using specially thick paper, printed with suitable colours. Silicate adhesives offer many advantages over animal and vegetable products. Thus they are uniform, relatively cheap, are supplied ready for use, can be applied without warming, and are fireproof. In addition, they are odourless, and do not decay or undergo putrefaction, qualities of particular importance in the manufacture of containers for edible products. Also no potential food materials are consumed in their manufacture.

Synthetic and Rubber Adhesives.

The condensation products of naphthalene- and phenol-sulphonic acids with formaldehyde (syntans), harden on drying, and have been proposed by the Badische Company as adhesives for glass (*Ger. Pat.*, 337,956, of 1918). By condensing dicyanodiamide with formaldehyde in the presence of sulphuric acid, adhesives of varying fluidity can be prepared, according to the proportions. Thus, with 2 parts, 30 per cent. formalin to 1 of the diamide, the product resembles gum arabic, while with less aldehyde, a more viscid product results (*Ger. Pat.*, 323,665, of 1919). As adhesives for articles made of cellulose esters, the Bayer Company propose to use adipic esters. For ethyl cellulose products, β-naphthyl amyl ether is proposed (*Ger. Pats.*, 317,412, and 322,648, of 1917).

Rubber enters into the composition of the long known marine glues. One formula for such an adhesive requires a solution of 10 parts rubber in 120 parts benzol to be incorporated with 20 parts molten asphalt.* An adhesive composition suitable for coating balloon fabrics (rubber dope), consists of cellulose acetate (60), rubber (20) and tetrachlorethane (600 parts by weight). Sulphur may also be added (*Brit. Pat.*, 129,630, of 1919). Schidrowitz has recently patented an adhesive for coating leather with rubber. It consists of alkaline latex and glue, the film having glue on one side and rubber on the other (*Brit. Pat.*, 166,731, of 1920).

THE ESTIMATION OF SULPHUR.

NEW RAPID AND ACCURATE METHOD.

An interesting method for the rapid determination of sulphur that has been proposed recently by L. Losana (*Giorn. Chim. Ind. Appl.*, April, 1922) is based on the fact that when a compound containing sulphur is heated with powdered iron in absence of air the sulphur undergoes such transformation that it is liberated completely as hydrogen sulphide when the resulting mass is subsequently treated with hydrochloric acid. The hydrogen sulphide is absorbed by zinc-acetate solution, and the sulphide thus formed titrated with iodine solution.

According to an *Analyst* abstract of Losana's paper, if the substance contains 0—5 per cent., 5—10 per cent., or more than 10 per cent. of sulphur, the amount taken for analysis is 1 gramme, 0.5 gramme, or 0.1 gramme respectively. This is mixed, in a hard glass tube, about 4 cm. long, with 2 grammes of pure powdered iron and 0.5 gramme of sodium hydrogen carbonate, the mixture being covered with a layer several mm. deep of the iron, and then heated to incandescence for a few minutes.

For the decomposition with acid, use is made of a small round-bottomed flask with a ground stopper sealed to the tube of a reflux condenser, the upper end of the tube being bent over to pass through the cork of a bulbed absorption tube containing about 150 c.c. of 2.5 per cent. zinc-acetate solution, rendered slightly acid with acetic acid. A gas delivery tube dipping into a little water in the flask is sealed horizontally through the head of the ground stopper, and ends in a vertical cross-piece to form a T-piece. The latter is connected at the top with a source of carbon dioxide, and at the bottom with a rather long rubber tube joined to a tapped funnel. The hard glass tube is allowed to cool somewhat, and is dropped, while still hot, into the flask, and thus broken by the cold water.

A rapid current of carbon dioxide, washed by permanganate solution and then by water, is passed through the flask, and hydrochloric acid introduced through the funnel. When the reaction slackens, the flask is heated gently; and when evolution of gas ceases, carbon dioxide is passed briskly through the apparatus for about five minutes. The liquid from the absorption bulbs is transferred to a beaker, diluted to 300—400 c.c., mixed with a known volume in excess of standard iodine solution, allowed to settle, and titrated with thiosulphate solution, the sulphur being calculated from the equation. $ZnS + I_2 = ZnI_2 + S$. The content of sulphur in the reagents used is checked by a blank experiment.

Tests made on flowers of sulphur and with copper, lead, barium, and cobalt sulphates yielded virtually theoretical results. The whole of the operations occupies about 40 minutes. The method is applicable also to organic compounds; but these must first be mixed with copper oxide or lead chromate and heated, in a porcelain crucible if the compound is non-volatile, or in a narrow hard glass tube and covered with a deep layer of the oxidising material if the compound is volatile.

---

* The most recent proposal, however, is that of Ditmar (*Chemiker Zeitung*, August 25, 1923), who suggests utilising rubber latex directly as an adhesive. On evaporation of the water, the rubber hydrosol becomes converted into the hydrogel, a process which is irreversible by water. This rubber latex adhesive is stated to be suitable for all purposes for which sodium silicate is applied, and its absence of alkalinity is a decided advantage. Adhesives made from ordinary rubber solutions, in which the rubber remains as an organogel, are converted by any organic liquid which is either a solvent or a swelling agent for rubber, back to the state of organosol. —Ed., *C.T.J. and C.E.*

THE INSTITUTE OF METALS.

PAPERS READ AT MANCHESTER AUTUMN MEETING.

THE Autumn Meeting of the Institute of Metals was held in Manchester from September 10 to September 13. The proceedings opened at 8 p.m. on the 10th, when Lieut.-Colonel Sir Henry Fowler, K.B.E., delivered the Second Annual Autumn Lecture on subjects of practical interest to those engaged in the non-ferrous metals industry. The lecture was delivered in the Milton Hall, Deansgate, Manchester, before a crowded audience, and the subject was "The Use of Non-Ferrous Metals in Engineering."

The remainder of the proceedings were held in the Municipal College of Technology, and summaries are given below of those papers presented which are considered of most interest to chemists and chemical engineers.

Red Stains on Brass.

In this paper, presented by E. A. Bolton, M.Sc., on Tuesday, the author gave an account of work carried out to elucidate this problem. The various theories which have been from time to time put forward were reviewed and experiments described which bear upon these theories. The outstanding point is that the stains actually occur through reactions of copper oxides in the scale formed during annealing and the pickling medium. Cupric oxide, contrary to the usual opinion, was shown to be as harmful as cuprous oxide.

It was shown that oxides of copper may be present from various causes, such as careless washing after the pickling operation, resulting in the presence of acid and salts during the subsequent annealing; the presence of iron in the brass or upon its surface; the use of impure rolling oils, etc. It was concluded, however, that the main cause of the oxidation of the copper is the use of old-fashioned annealing furnaces in which the flames impinge directly upon the brass.

Brinell Hardness Numbers.

Dr. W. H. Brownsdon, M.Sc., Ph.D., F.I.C., presented a note on Brinell hardness numbers with a view to drawing attention to the desirability of authors expressing Brinell numbers for non-ferrous metals in figures that may be comparable. This is not a difficult matter, seeing that the desired result is obtained if balls and loads are used for which the ratio L/D^2 (the load in kilogrammes divided by the square of the ball diameter in millimetres) is constant. Unfortunately the numbers found with one ratio for L/D^2 are not convertible to the numbers that would be given using a different ratio. Dr. Brownsdon suggested that the choice for the large group of copper alloys with Brinell hardness numbers from about 40 to 200 should rest between the ratio 5 as standardised in the United States or the ratio 10 which is favoured in some quarters in this country.

Crystallisation Effects in Galvanised Iron Sheets.

Manufacturers of galvanised iron and steel goods have always sought to produce a zinc-covered surface having large characteristic spangles. The absence of, or the production of, only small spangles has been attributed to many causes. The quality of the steel, either the presence of sulphides and other non-metallic inclusions, or its condition produced by rolling and subsequent treatment, the pickling, either caused by impurities in the acid, by the occlusion of gas by the metal, the temperature of the bath, and the purity of the zinc, have all been blamed for the failures.

A paper by Messrs. J. Dickson Hannah and E. L. Rhead gave an account of a research to ascertain the real causes. The research shows that the metal—iron or steel—has practically no influence on the result if the temperatures are satisfactorily maintained. It was shown that pure zinc did not yield the desired large spangles, and that too high a temperature interfered by producing large quantities of a zinc-iron compound which crystallised in needles on the metal and interfered with the development of the spangle. The presence of tin or aluminium—contrary to expectation and as commonly stated—did not produce the desired result, but the addition of lead did so immediately.

Judging from the known relationships between zinc and lead the authors argued that the separation of the impure zinc forming the layer on the metal sheet into conjugate solutions—lead-rich and zinc-rich—at the dipping temperature, and the method of subsequent crystallisation, were the causes of the effects obtained. The separation is attributed, and proved by experiments, to the difference in the surface tensions of the two solutions. Proof of the hypothesis was furnished by the fact that bismuth, the only common metal that resembles lead, more or less, in its relations with zinc, produces similar effects.

Nickel in High-grade Bearing Metal.

A note by A. H. Mundey and C. C. Bissett, B.A., B.Sc., gave a brief account of a practical trial of the effect of varying small quantities of nickel upon a tough and well-reputed bearing metal. There was chosen for test the well-known alloy consisting of: Tin, 93 per cent.; antimony, 3.5 per cent.; and copper, 3.5 per cent. The results of the usual physical tests were detailed, and the authors concluded that the beneficial results of nickel in alloys of the character employed are yet to be demonstrated.

Alloys of the "Duralumin" Type.

A paper presented by Marie L. V. Gayler, M.Sc., on Wednesday, dealt with the constitution and age-hardening of the quarternary alloys of aluminium, copper, magnesium, magnesium silicide, containing up to 6 per cent. copper, 4 per cent. magnesium, and 4 per cent. magnesium silicide. The results showed that when copper, magnesium, or magnesium silicide are present in aluminium, any two of these components have a marked effect on the solubility of the third. The sum of these effects is that ultimately $CuAl_2$ and Mg_2Si are both thrown out of solution. Also, if copper and magnesium are present in a ratio greater than 12 to 5 approximately, then alloys when quenched from high temperatures age-harden at room temperature, owing to the difference in the solubility of Mg_2Si at the quenching and ageing temperature. If, however, the ratio of copper to magnesium is less than 12 to 5, then no age-hardening takes place, since there is little difference in the solubility of Mg_2Si at high and low temperatures. The age-hardening of alloys of the "Duralumin" type is due therefore primarily to Mg_2Si, and the addition of magnesium and copper is important, since both reduce the solubility of Mg_2Si at high and low temperatures and consequently reduce the maximum age-hardness due to Mg_2Si.

The Electro-Chemical Character of Corrosion.

In a paper by Ulick R. Evans, M.A., experiments were described which indicate that the corrosion of metals is mainly—probably entirely—electro-chemical in character. There are two main types. The type accompanied by evolution of hydrogen gas is characteristic of reactive metals placed in acid solutions, but the velocity varies greatly with the degree of purity of the metal. Where this type is impossible, slower corrosion can take place at a rate determined by the diffusion of oxygen to the metal, and comparatively independent of the purity. When a metal is immersed in a solution of potassium chloride, one can observe the production of alkali at the cathodic portions, the production of the chloride of the metal at the anodic portions, and the precipitation of hydroxide where these meet.

The electric current can be trapped and measured, and is found (by applying Faraday's law) to account for the greater part of the corrosion actually observed. Generally the cathodic areas are those to which air has free access, whilst the anodic areas are those protected from aeration. It is significant that corrosion usually proceeds most rapidly at the comparatively "unaerated" places—hence the intense corrosion observed in "pits" and over areas covered up by porous corrosion-products. (See page 307 for a fuller account of this paper.)

The Effect of Oxygen on Copper.

This paper, by D. Hanson, D.Sc., C. B. Marryat, B.Sc., and Grace W. Ford, B.Sc., was the first part of a comprehensive investigation of the effects of impurities on copper, and described the effect of oxygen, up to a concentration of 0.36 per cent., on the properties of pure copper. The results indicate that oxygen has a relatively small effect on the properties of copper, and is neither seriously deleterious nor remarkably beneficial. The mechanical properties are not much affected by small quantities of oxygen, and copper containing as much as 0.1 per cent. differs very slightly from pure copper. The electrical conductivity does not fall rapidly, and values exceeding 100 per cent. of the International Standard are obtained in all annealed materials containing less than 0.1 per cent. of oxygen. The relatively small effect of oxygen is without doubt due to the fact that the solubility of the oxide in solid copper is extremely low—so low, in fact, that for all practical purposes oxygen may be regarded as insoluble in solid copper. These conclusions,

however, are applicable strictly only to pure copper containing oxygen and free from other impurities. The effect of the simultaneous presence of other impurities may be very appreciable, and requires special investigation, for which the present Report furnishes a necessary basis.

Other Papers Presented.

The following papers were also presented to the meetings: "Stereotyping," by A. H. Mundey and John Cartland, M.Sc.; "The Effects of Rate of Cooling on the Density and Composition of Metals and Alloys," by R. C. Reader, Ph.D., M.Sc.; "The Measurement of the Change in Volume in Metals During Solidification," by Hikozo Endo; "Experiments with Some Copper Wire—Cohesion a Function of Both Temperature and Cold Work," by Douglas H. Ingall, M.Sc.; "Equilibrium in the System Gold-Zinc," by Professor P. Soldau; "The Behaviour of Metals Under Compressive Stresses," by H. I. Coe, M.Sc.; "Hardness Tests on Crystals of Aluminium," by Hugh O'Neill, M.Met.; and "A Dilatometric Study of the Transformations and Thermal Treatment of Light Alloys of Aluminium," by Albert M. Portevin and Pierre Chevenard.

HYDROGENATED PHENOLS AND CRESOLS.*

THEIR USE IN SOAPS AND FOR GENERAL TEXTILE PURPOSES.

BY the process first discovered by Sabatier, phenol is easily hydrogenated in the presence of nickel, and if the reaction is carried out at 180° C. yields a product consisting of cyclohexanol $C_6H_{11}OH$, about 4 to 5 per cent. of unchanged phenol and small quantities of cyclohexanone and cyclohexane as impurities. By hydrogenating this crude product (B.P. 155-165° C.) a second time at 150-170° C., purification is effected, the phenol and cyclohexanone becoming converted completely to cyclohexanol.

The Hydrogenation of the Cresols.

At a temperature of 200-220° C., orthocresol gives a yield of over 90 per cent. of ortho-methylcyclohexanol. The little ketone that is formed may be removed by means of sodium bisulphite. Under similar conditions, meta-cresol gives a mixture of the alcohol and ketone, but after a second hydrogenation gives almost pure meta-methylcyclohexanol. Working at a temperature of 200 to 230° C. para-cresol gives para-methylcyclohexanol containing traces only of ketone.

Control of Catalyst and Hydrogen Supply.

L. Brunel (*Chem. Zeit.*, 1906, p. 345), by volatilising phenol to which a little water had been added and reducing over nickel at 170-175° C., obtained a smooth reaction and almost complete conversion to cyclohexanol in one operation. The metallic nickel catalyst is made by reducing nickel oxide in hydrogen at a temperature of 250-280° C. If the temperature exceeds 350° C. the nickel formed is unsatisfactory for the hydrogenation of aromatic nuclei. The slightest traces of chlorine, bromine, or iodine in the nickel also spoil its catalytic activity. The nickel oxide used is prepared from the basic nitrate or the sulphate of the metal. The hydrogen used in the hydrogenation process must be of exceptional purity. Arseniuretted hydrogen, sulphuretted hydrogen, and other sulphur compounds, phosphine, volatile hydrocarbons, and especially carbon monoxide, are powerful catalyst poisons. Cyanogen compounds, chloroform, acetone, and free mineral acids also impair materially the activity of the catalyst.

According to Sabatier and Senderens, the nickel forms an unstable hydride which decomposes with the liberation of active monatomic hydrogen. The formation and decomposition of the nickel hydride proceed rapidly and continuously in the presence of a substance that can combine with the active hydrogen. The nickel hydride intermediate product formed according to this theory has never been isolated, but, on the other hand, none of the numerous experiments on the subject have given data incompatible with the theory.

"Hexalin" and "Methyl Hexalin."

Cyclohexanol is put on the market under the name of "hexalin," and the mixture of the three isomeric methylcyclohexanols obtained by the catalytic reduction of commercial cresol is sold as "methyl hexalin." Both materials are manufactured on the large scale by the Tetralingesellschaft m. b. H. at Rodleben, near Roszlau, Anhalt. The products are technically pure, free from the slightest traces of unchanged phenol or cresol, and have the following constants:

	D 20°	B.P.	Ignition Pt.	Refractive Index.	Acetyl Value.
Hexalin $C_6H_{11}OH$ ..	0.945-0.949	155-160° C.	68° C.	1.4680	561
Methyl hexalin $C_7H_{13}OH$	0.930	160-180° C.	68° C.	1.4635	492

The odour of these materials resembles that of menthol or camphor, and is in no way similar to that of phenol or cresol. Hexalin and methyl hexalin dissolve fats, oils, waxes, resins, mineral oils, highly-oxidised fats, linoxyn, rubber, cellulose acetate, celluloid, metal fatty acid salts, and metal resinates. With turpentine, tetralin, dekalin, benzine, benzol, aniline, chlorhydrocarbons and carbon bisulphide, hexalin and methyl hexalin are miscible in all proportions. Being alcohols of high molecular weight, they are only slightly soluble in water and aqueous solutions. The two materials are water-white, viscid, oily liquids, ressembling in appearance distilled glycerine, but possess the valuable property of forming clear mixtures with aqueous soap solutions of the usual fatty acids, which mixed solutions possess remarkable solvent or emulsifying powers for fats, fatty acids, mineral oils, or waxes.

Solubility in Aqueous Soap Solutions.

The solubility of methyl hexalin in aqueous soap solutions is somewhat lower than that of hexalin, and varies somewhat with the nature of the soap. In most cases, however, the amount of methyl hexalin or hexalin going into solution is considerably more than double the weight of the soap in the solution. According to Hueter (*Zeit. der Öl und Fett Industrie*, 1921, No. 34), a potash olein soap containing 25 per cent. of water will dissolve considerable quantities of hexalin, and even aqueous solutions of such soaps, with a soap content of 5 per cent. and under, dissolve hexalin in proportions many times that of the soap content.

Valuable Properties of Hexalin Soaps.

Hexalin and methyl hexalin, as well as their solutions in soaps, also possess the property of readily dissolving lime and magnesia soaps. In addition to their solubility in hard waters, these new soaps are also stable to dilute organic acids. Albumen emulsions, such as are present, for example, in cow's milk, are completely clarified by the addition of hexalin soaps. Blood, serum, and similar fluids loose their property of coagulating if a little hexalin soap is added, and there is thus no doubt that soap preparations which contain a greater or less amount of hydrogenated phenols possess a detergent power considerably exceeding that of the soap products usually met with in commerce. It is quite immaterial whether sodium or potassium soaps are used with the hexalin or methyl hexalin; the result—namely, the energetic washing and purifying action and the excellent solubility—differs only in degree for both classes of soaps.

The Lathering Powers of Hexalin Soaps.

The lathering power of a soap is not harmed by small amounts of hexalin or methyl hexalin, although large amounts will completely prohibit foam formation, a property possessed by alcohols in general. It is therefore advisable in cases where marked lathering power is desired to choose as the fat ingredients of the soap, a mixture of coconut oil, palm kernel oil or their fatty acids, on the one hand, and of high molecular weight fatty acids (olein, stearic acid, etc.) on the other. The lathering power of such neutral soaps containing hexalin or methyl hexalin can be still further enhanced by the addition in small quantity of any fatty acid (olein or the fatty acids of castor or coconut oils), without the solubility properties of the soap being in any way impaired.

The presence of hexalin or methyl hexalin in neutral soaps also reduces the amount of hydrolysis of such soaps in aqueous solution to very small proportions. By the addition of a hydrogenated phenol the whole character of the soap body undergoes a far-reaching change, the character of which may be best summarised by stating that the capacity of such soaps to be "salted out" is very greatly reduced. Even pure tallow soaps or soaps composed principally of hydrogenated fats undergo a change on the addition of hexalin, which brings their properties almost on a level with those of the lye soaps or of the soaps made from castor oil. Schrauth (*Zeit. der Öl u. Fett Industrie*, 1921, No. 9) points out with truth that these new soap compositions open out an almost unlimited field of application in the textile industries, especially for wool-washing purposes.

(To be continued.)

* A Report by Ing. Chem. Welwark, of Vienna. Translated and rearranged from the *Chemiker Zeitung*, Sept. 3, 1923.

MODERN METHODS OF WATER PURIFICATION.

DETAILS OF LARGE THAMES-WATER INSTALLATION.

IN a paper at the Shipping, Engineering and Machinery Exhibition, Olympia, on Friday, September 7, Mr. J. P. O'Callaghan, F.C.S. (of United Water Softeners, Ltd.), briefly reviewed the leading methods used at present for industrial water purification. During the past five years, he said, comparatively little had been written regarding the treatment of waters of various sources and character for industrial purposes.

The experience of steam users in every part of the world seemed to show that satisfactory boiler feed water as a rule could only be obtained by the use of well-designed and carefully operated purification systems, which repaid their cost in a longer or shorter period.

The leading methods used nowadays for water treatment the author summarised as follows:—(1) Sedimentation and filtration; (2) lime-soda softening by the cold process; (3) lime-soda softening by the hot process; (4) permutit softening; (5) de-concentration; (6) de-gassing; (7) evaporation; and (8) boiler compounds.

A Combined Sedimentation and Filtration Plant.

Dealing with sedimentation first, Mr. O'Callaghan described a combined sedimentation and filtration plant recently put into operation at the Beckton works of the Gas, Light and Coke Company, capable of dealing with 4,000,000 gallons of Thames water per day. The water at Beckton was tidal, and was frequently excessively turbid, so that a thoroughly efficient filtration plant was essential. The plant consisted of four large sedimentation basins, and 8 rapid sand filters of the gravity type, and was particularly interesting on account of the high degree of efficiency obtained by the primary basins. The water to be treated was raised from the river by centrifugal pumps driven by vertical spindle electric motors. The pumps were placed at about half tide level, thus being entirely submerged at high tide, and having a maximum suction lift of approximately 14ft. at extremely low tide. The delivery to the filtration plant was through two 12in. C.I. mains. The filtration plant was built on 121 reinforced concrete piles 14in. square and 38ft. long, and comprised 8 filters, housed in a suitable building, with adjoining basins for coagulation and sedimentation, together with a water tower for storage of cleansing water for washing the filter beds, air blower, pumping plant, and filtered water reservoir, from which the supply was drawn and discharged into the works' mains. The water delivered to the plant from the river was received into a chamber fitted with baffling and diaphragm partitions, then passed into a measuring channel, and overflowed 2 brass plate rectangular weirs.

Details of the Chemical Treatment.

As to chemical treatment, a definite proportion of the total incoming flow passed through the smaller weir into an automatic measuring apparatus fitted with a chemical container, and the chemical valve fixed to the latter was adjusted to deliver the exact quantity of lime to effect coagulation and precipitation of the suspended siliceous matter contained in crude Thames water. The intimate admixture of the lime with the water was obtained by its fall into a trough, and thence along distributing channels communicating with the coagulation and sedimentation tanks. These basins were of sufficient size to hold approximately 600,000 gallons of water, thus allowing for nearly four hours time period for reaction and sedimentation when the plant was working at its full rated capacity. The design of the basins permitted of speedy and efficient cleansing through the sludge valves and drain sewers. After allowing the heavier impurities and a considerable portion of the coagulated flocculent to precipitate in the sedimentation basins, the water was decanted over a trough communicating with the filter inlets.

The Filter Units.

The filter units, 8 in number, were of the open gravity type. Each was 22ft. long by 12ft. wide. When the rated flow of 4,000,000 gallons per day was being dealt with, and all the filters were working, each square foot of filtering area would pass 79 gallons of water per hour. The flow through the inlet valve of each filter passed along a system of communicating troughs placed above the surface of the same bed, and the incoming water was thus distributed over the entire filtering area by overflowing the edges of these troughs. The filtering medium employed was a specially sifted and suitably graded mined quartz sand supported on a bed of double-washed and graded gravel. Below this, a manifold system of lateral collecting tubes fitted with safety strainers was arranged, which uniformly drew off the water from the entire filter bed area. The filtered water thus collected was discharged through a central pipe and automatic rate of flow control valve into a chamber. From this it flowed out through a weir into the filtered water channel and thence to the reservoir sump, of 60,000 gallons capacity, from whence it was picked up by high lift motor-driven centrifugal pumps and discharged to the works.

Cleansing the Filter Beds.

The filter beds were cleansed with air and wash-water. The operation was performed by agitating the filtering medium with air for about two minutes at a pressure of 3 to 5lb. per sq. in. A reverse current of cleansing water was then applied to the underside of the filter bed, and in its passage upwards through the bed the impurities deposited on the sand were floated over into the collecting waste troughs and carried out through a waste pipe to the drain channel. In this manner, each filter was thoroughly cleansed and restarted to work within the space of 10 to 12 minutes. The air for the aeration of filters was obtained from a motor-driven rotary blower. The filtered water used for washing the filters was raised from the filtered water reservoir to a tower storage reservoir having a capacity of 40,000 gallons, and was drawn from there and used as required.

The water for use in the works, after treatment, was picked up by four sets of centrifugal pumps, which had their suction in the reservoir or sump constructed directly underneath the pump room, and these delivered into the Company's main at a pressure of 80lb. per sq. in. The coagulating and sedimentation tanks, filters, platforms, chemical house, inspection chambers, channelling, filtered water sump and wash water tower were of reinforced concrete construction. The floors of the pump room and the upper and lower platforms of the filter house were laid with terrazzo, and green glazed brick coping was laid around the filter tanks and platforms. The plant was one of the largest ever put to work, and, by its use, the Gas, Light and Coke Company relieved the London water supply of over a thousand million gallons per annum.

Permutit B, A Valuable New Zeolite Product.

The lecturer then dealt briefly with lime-soda softening both by the cold and the hot processes. Softening by the Permutit zeolite process was then dealt with. Another type of Permutit had recently been introduced for industrial use. This new material, named "Permutit B," differed from ordinary Permutit both in physical characteristics and molecular constitution, these differences causing a radical change in the timing of the periodic cycle of softening and regeneration, and enabling day and night continuous duty to be performed by one unit only, instead of two. In the case of ordinary Permutit a single unit was usually designed to soften continuously for a maximum period of 10 or 12 hours, and it then required an equal length of time for regeneration. In the case of Permutit B, the plant was designed to operate for periods varying from three to six hours at a time, and was then completely exhausted. The material, however, was capable of extremely rapid regeneration, and a large industrial unit could be completely regenerated and recommissioned in an hour. Although the actual base-exchange activity of the new material was somewhat less than that of the ordinary Permutit, this was amply compensated for by the more rapid action of the material in both directions—*i.e.*, during softening and regeneration. By taking advantage of this, a higher rate of flow during softening could be attained, while the reduction of the period of regeneration from 12 hours to 1 hour had become ordinary practice. A very important advantage was that a reduced salt consumption in regeneration was possible with Permutit B as compared with the older material. Again, the new material was of a hardier physical character, and, therefore, less susceptible to loss through wear and tear in general usage.

Softening Boiler Feed-water by Permutit Process.

In many respects softening boiler feed-water by means of zeolite was ideal. The method was not applicable, however, to all conditions, and careful preliminary investigation should be made of the quality of the raw water supply, the

operating conditions of the boilers, and the service to be rendered. The question could only be satisfactorily decided in the light of a reliable analysis of the water, due regard being paid to the proportions of temporary and permanent hardness, the boiler pressure, type of boiler, etc. The author had observed a number of Permutit plants softening water for boiler feed, and in no instance had any scale or sludge been deposited within the boilers fed, even after prolonged periods of steaming.

At several places combined lime-soda and Permutit systems had been installed, and were operating satisfactorily. In general, it was not usually economical to treat a water entirely by the regenerative process, where the hardness of the water was in excess of 40 grains per gallon, but this depended largely upon local conditions, as waters containing 40 grains per gallon or more were being treated successfully by this method alone.

MECHANISM OF METALLIC CORROSION.

GENERAL CONCLUSIONS AS TO ELECTRO-CHEMICAL CHARACTER.

AMONG the important papers which were read before the Institute of Metals at Manchester this week was one by Mr. Ulick R. Evans, M.A., on "The Electro-chemical Character of Corrosion." A summary of this paper appears elsewhere in this issue, but, in view of the importance of the subject, we give below, in greater detail, some of the author's general conclusions. Mr. Evans states:

If the experiments described above, dealing with eight different metals (iron, lead, copper, silver, zinc, cadmium, aluminium, and nickel), are considered as a whole, it may be claimed that each part of the electro-chemical mechanism of corrosion has been demonstrated. Where the metal is immersed in a neutral salt solution, it has been possible to show: (1) The production of a current. (2) The production of a metallic salt at the anodic portions. (3) The production of alkali at the cathodic portions. (4) The precipitation of hydroxide where they meet.

The Cathodic and Anodic Areas.

If the aëration is uniform, it is apparently the distribution of impurities that determines which portions shall act as cathodes and which as anodes. If, however, the aëration is not uniform, then—provided there is a sufficient amount of noble impurities distributed throughout the metal as a separate phase—the cathodic and anodic areas are determined by considerations of the supply of oxygen, the "aërated" areas being cathodic and the unaërated anodic. Experiments on pure cadmium and lead seem to show that some impurities are actually needed on the aërated portions to act as cathodic particles; mere selective aëration of one area will not cause it to become cathodic, unless a suitable noble impurity is present. If, however, there are noble impurities scattered throughout all parts of the metal, the machanism of selective aëration must be as follows: When one part of a piece of metal is aërated, and one is protected from aëration, the foreign particles in the protected area cannot (after the first moments) function as cathodes, because there is no supply of oxygen for the cathodic reaction. The foreign particles on the aërated portion act as cathodes, therefore, to the dominant metal in both areas; but in the aërated area the accumulation of insoluble corrosion product soon begins to interfere with the anodic function of the metal surrounding the foreign particles; and accordingly we are left with the foreign particles in the aërated area acting as cathodes, and the bright unobstructed metal of the unaërated area acting as anode. The anodic attack would be expected to be most pronounced in the portions of the unaërated area closest to the aërated area, as has been found to be the case.

Corrosion in Inaccessible and Accessible Places.

We thus obtain a rational explanation of the dangerous corrosion occurring at the bottom of pits and crannies, and other *inaccessible* places, as well as in areas covered with porous debris—a phenomenon well known to practical men. At such places, which are wholly anodic, owing to the absence of oxygen, the product of corrosion is generally a soluble metallic salt, which does not interfere with the subsequent course of corrosion. Over the *accessible* parts of the surface of a metallic article we may indeed temporarily experience electro-chemical corrosion; but here the cathodic and anodic areas are close together, and insoluble metallic hydroxide is produced close against the metallic surface and tends to protect it, and thus stop the action. The electro-chemical explanation of the intense corrosion occurring at sheltered places is the only satisfactory one.

The production of a protective film on the anodic areas of the metal often introduces a complicating factor; this is most serious in the case of aluminium. Indeed, the "influence of the corrosion product" is probably the most vital factor in determining the course of the later stages of corrosion. On the other hand, the presence of a porous, gelatinous precipitate over these areas may act as a diaphragm, allowing the current to pass, but hindering the diffusion of oxygen to those areas; this will actually favour the reaction.

The Influence of Colloidal Processes.

It may be asked, "How far do considerations of colloidal chemistry affect corrosion?" The answer is simple. Considerations of colloidal chemistry enter into the precipitation of all gelatinous hydroxides, since the gelatinous precipitate is merely an aggregation of particles of colloidal size. Under certain circumstances, the hydroxide may remain in the state of colloidal solution for some time; under other conditions, precipitation may occur quickly. There is, however, no justification in adopting a view that corrosion in its early stages is a colloidal phenomenon in a sense other than ordinary precipitation is a colloidal phenomenon. In the later stages of corrosion, colloidal processes enter into consideration in another way. The "loosening" effect of certain salts, notably chlorides, on the corrosion product is probably akin to peptisation. If Bancroft's theory of peptisation is accepted, this means that complex colloid particles are formed by the union of metallic ions with the insoluble corrosion product.

Effect of Differential Aëration on the Total Corrosion.

It has been proved that the unequal aëration of a metallic surface tends to produce intense corrosion at certain points—namely, those parts of the unaërated area which are most close to the aërated area. An important question, however, remains to be decided: Is differential aëration actually a necessary factor for corrosion, or does it merely cause the corrosion which would otherwise be distributed over the whole area to be concentrated at certain points? Experiments were conducted to settle this matter.

A glass desiccator vessel of the familiar form (but without the zinc grid) was filled with 1½ litres of potassium-chloride solution, and before the experiment air was bubbled through the solution. Numerous pieces of metal, previously weighed, were placed in the solution and kept there for some days. Some were placed flat on the annular glass shelf around the vessel, while others were supported at the same level by being placed across two very fine glass threads which extended across the centre of the vessel. The latter specimens were exposed to the action of diffusing oxygen over their whole surface, the area covered up by the glass thread at the points of support being negligible. The specimens placed flat on the shelf, on the other hand, were protected from oxygen on their lower surface. They showed—when the specimens were examined before and during removal—all the phenomena typical of differential aëration. Around the lower edge of each specimen was a quantity of metallic hydroxide, formed where the metallic salt from the lower (anodic) area had intermingled with the alkali from the upper (cathodic) area. After rubbing, washing, and drying, the specimens were reweighed.

The results show very clearly that differential aëration is *not* needed for corrosion; the specimens supported on the glass threads were in general corroded more quickly than those placed on the glass bottom. If the corrosion rate is determined by the diffusion of oxygen to the surface, this is indeed to be expected.

Apparently, therefore, the effect of restricting the access of oxygen to one part is not to increase the *total* corrosion of the specimen (at least during the early stages of corrosion), but to concentrate on the non-aërated area the corrosion which would otherwise be spread over the whole surface. Therein lies the danger of unequal aëration. An amount of corrosion which would be quite harmless if spread evenly over the surface of an article may become serious if confined to one particular area; while if it is concentrated within one single pit, it may quickly cause perforation of the article in question.

PHENOLS IN COAL-TAR OILS.

RAPID METHOD OF ACCURATE ESTIMATION.

FROM time to time a great many methods have been advocated for determination of actual phenols or tar acids in coal-tar oil, such as creosote oil, dip oil, etc., and in crude carbolic acid. Where only a rough determination has been required, almost any of these methods is suitable. A demand for a greater accuracy of determination and closer check between producer and consumer is, however, frequently made, and it was to meet this demand that an investigation of some of the existing methods has been made by J. Bennett Hill, of The Barrett Company, New York (*Industrial and Engineering Chemistry*, August, 1923).

The "Contraction" and "Liberation" Methods.

The successful methods for determination of phenols in oils and crude acids are all based on their solubility in soda and their extraction from the oils with a solution of sodium hydroxide. They may be divided into two main classes—first, those which use the contraction in the volume of the oil or the increase in the volume of aqueous soda as the measure of the phenols; and second, those which liberate the phenols from the carbolate solution obtained and measured the volume of liberated acids. The first class may be called the "contraction" methods, and the second class the "liberation" methods. Among the detailed methods belonging to the first class may be mentioned those of Weiss and of Chapin. Weiss uses a simple repeated extraction of the distilled oil in a specially graduated separating funnel, and takes the contraction in volume of the oil as the volume of phenols contained in it. The method of Chapin consists of steam distillation of the original oil, a somewhat elaborate procedure for concentrating the phenols in the steam distillate into a small quantity of benzene, and final measurement by shaking with caustic soda solution and measuring the increase in volume, multiplying the result by a factor empirically determined, which happens to be the reciprocal of the specific gravity of the phenols.

Among the liberation methods are included those of Weiss, Allen, and most of the methods in use by various industrial laboratories. The methods in general differ only in detail, the liberation method of Weiss differing also from the others in that the phenols after liberation are dissolved in refined coal-tar naphtha before measurement.

It has been generally believed that the contraction method gave results higher than the correct values, and the liberation methods results lower than the actual, but much closer than those obtained by the contraction methods. Mr. Bennett Hill's experience has failed to bear out this impression, however, and it was therefore hoped that the present work would throw real light on the relative accuracies of the various methods.

Analyses of Synthetic Mixtures.

The first part of the investigation consisted of the analyses of synthetic mixtures by the various methods. For the preparation of these mixtures a neutral coal-tar oil was used from which the phenols and pyridine bases had been completely removed by extractions with soda and with sulphuric acid. The phenols consisted of a mixture of specially purified, oil-free phenol, *o*-cresol, and *m*-*p*-cresol in proportions to approximate their natural occurrence. Mixtures of the oil and phenols were made up by volume with great care. In order to determine the effect of a less careful purification of the oil used in the mixtures, two mixtures were made from oil in which the pyridine bases were not extracted and the tar acids only roughly extracted. This showed a pyridine-base content of 4 per cent. and a tar-acid content of 0.3 per cent., the tar acids being determined by a liberation method, and being, therefore, actually isolated and identified as phenols. All these mixtures were analysed by the modified Weiss contraction method, and some by the modified Weiss liberation method. The results appear in Table I.

TABLE I.—ANALYSES OF SYNTHETIC MIXTURE.

Sample.	Phenols Present Volume, Per Cent.	Phenols Found Volume Per Cent.		Remarks.
		Contraction Method.	Liberation Method.	
1	3·0	3·0	—	—
2	20·0	20·0	20·3	—
		19·8	20·2	—
		20·2	—	—
3	25·0	25·0	—	—
4	25·0	25·2	—	Pyridine not extracted.
5	25·2	25·2	25·9	Pyridine not extracted.
		25·3	26·0	Pyridine not extracted.
		25·5	—	Pyridine not extracted.
6	95·26	95·2	—	—
		95·6	—	—

It will be noted from the table that the results with the contraction method are slightly higher than the theoretical, while the results with the liberation method are still higher. The incomplete extraction of the oil used in the mixtures appears to have very little effect on the contraction method at least.

Analysis of Commercial Oil.

The fact that the contraction method gives good results on a synthetic mixture of a purified oil and a purified tar-acid mixture, does not necessarily show that it gives equally as good results on a natural coal-tar oil which has not been extracted. Accordingly, determinations were made by both the contraction and liberation methods on two samples of commercial dip oils. The results given in Table II. show a good check between the two methods.

TABLE II.—ANALYSES OF COMMERCIAL OILS.

Sample.	Phenols Found, Volume Per Cent.		
	Contraction Method.		Liberation Method.
7	11·8	....	15·0
	15·0	....	15·0
8	25·6	....	25·1
	25·6	....	25·2
	25·3	....	—

It was noticed in the course of the work on the liberation method that in general the lower the volume of carbolate, the higher the final result. For example, in the results on Sample 5 in Table I., where results were obtained which are comparatively the highest, the lowest volume of carbolate was obtained. If this method is to be used, the volume and strength of carbolate to be obtained, together with the quantity of sulphuric acid to neutralise, should be standardised.

Details of Recommended Method.

The results of this work tend to establish the accuracy of the simple contraction method for determination of tar acids in oils and crude carbolic acid. The method recommended by Mr. Hill for general use on coal-tar oils and crude carbolic acids is in the following form:—

Apparatus.—Tar-acid funnel, 200-c.c. distilling flask; 100-c.c. standardised pipette; condenser

Reagents.—Sodium hydroxide, 10 per cent. solution.

Procedure.—A 100-c.c. sample of the oil at 25° C. is measured into the distilling flask and distilled to decomposition, the distillate being collected in the tar-acid funnel. The volume of the distillate is carefully read at 25° C., and, if no solids have separated, is extracted with three successive portions of 100 c.c., each of 10 per cent. caustic soda solution. In each case after the soda is added to the oil the whole is thoroughly shaken and is then allowed to settle completely before drawing off the soda layer. The volume of the residual oil after complete settling is carefully noted at 25° C. The decrease from the volume of the distilled oil before extraction to the volume after extraction is the per cent. by volume of phenols.

In the case of samples containing so much naphthalene as to show separated solids at 25° C., the temperature of the three measurements may be raised to 40°, or even 60° C., extraction being made also at the same temperature.

If the sample contains over 35 per cent. tar acids, the quantity taken for distillation should be cut to 50 c.c. or 25 c.c. so as to give not more than 35 c.c. of tar acids. Before distillation the material should be made up to 100 c.c. with clean, dry kerosene. The result obtained should be multiplied by 2 or 4.

Where the sample to be tested contains water it should be removed by catching the first few cubic centimetres of distillate in a small separating funnel containing a little saturated salt solution, separating the water and adding the oil to the rest of the distillate in the tar-acid funnel.

If no diminution in volume takes place on extraction, a trace of tar acids may be detected by acidifying the soda drawn off and noting the odour.

COMMERCIAL ETHYLATIONS.

THE USE OF DIETHYL SULPHATE.

ALTHOUGH dimethyl sulphate has been long known and widely used commercially for methylation purposes, the use of its ethyl homologue has not been developed to anything approaching the same extent. This state of affairs has been brought about by two main reasons. Firstly, the neutral ethyl ester of sulphuric acid has not been available for use in large quantities and in a pure state until recently; and, secondly, the information compiled by the earlier workers on the physical, chemical, and physiological properties of the ester has been rather inaccurate and misleading. Mr. Arthur S. Cade, who holds a Fellowship at the Mellon Institute of Industrial Research, sustained by the Carbide and Carbon Chemicals Corporation, of New York, has undertaken work to correlate the many loose individual facts and data already available on diethyl sulphate. His work has included not only a reinvestigation of all the fundamental properties of the material, but an examination of a wide range of type reactions to find out the best conditions for commercial ethylation in each individual case. The results so far obtained by Mr. Cade have been published in *Chemical and Metallurgical Engineering*, August 20, 1923. The following particulars are abstracted from this account:—

Physical and Chemical Properties.

Diethyl sulphate is, when pure, a colourless liquid with a pleasant though faint ethereal odour. It boils without decomposition at 96° C. at 15mm. pressure, and at 120.5° C. at 45mm. pressure. At temperatures above 150° C. it begins to decompose slowly, and at 208° C. it boils with considerable decomposition; the true boiling point probably lies several degrees higher. It has a density $D\ \frac{19}{4}$ of 1.1837. On cooling it forms crystals which melt at −24.5° C. This liquid is entirely neutral in reaction. It is nonmiscible with cold water; with warm water it is slowly hydrolysed, and on boiling it yields eventually 2 mols of ethyl alcohol and 1 mol of sulphuric acid. Diethyl sulphate is non-flammable.

Diethyl sulphate possesses several valuable natural advantages, chief among which are ease of manipulation, low working pressures, intensity of reaction, and ready availability. It is non-toxic, non-flammable, and non-corrosive. Having such a low vapour tension, due to its relatively high boiling point, it is possible to work with diethyl sulphate in vessels provided with an ordinary reflux apparatus.

Diethyl Sulphate, Non-Poisonous.

No toxic effects, similar to those noted and reported for dimethyl sulphate, are produced in the handling of diethyl sulphate. This is contrary to some incorrect statements which have appeared in the literature, and has been substantiated by Mr. Cade and others who have worked with the material over a long period of time. Closely observed, large-scale operations with diethyl sulphate over a period of years have failed to indicate the slightest danger attending its use. All that is necessary is to observe the ordinary precautions that should be observed in the use of any organic substance.

In general, the reaction of the first ethyl group in diethyl sulphate is extremely rapid even at room temperatures, and temperatures around 50° to 55° C. In some cases a slightly higher temperature of 110° C. is required to bring about complete reaction in the shortest time. A still higher temperature of about 145° C. and a longer time of heating are required for the second ethyl group to react efficiently as an ethylating agent. In other words, one ethyl group of diethyl sulphate reacts spontaneously and vigorously, while the other ethyl group reacts like the ethyl in sodium ethyl sulphate.

Experiments have been conducted to test the applicability of diethyl sulphate in a variety of compounds, amplifying the data given by previous workers. General types of compounds were chosen with which to form the alkylated derivatives. These include ethers, esters, amines, and imides. For this work a commercial grade (94 to 96 per cent.) and a practically 100 per cent. diethyl sulphate were used. This material was entirely free from foreign aliphatic radicals, thus insuring that only ethyl derivatives would be produced.

As a result of this investigation, the following general and specific conclusions have been drawn:—

Ethylation of Type Compounds.

1. Diethyl sulphate has reacted under various conditions as a most satisfactory general ethylating agent for the preparation of ethyl ethers, esters, amines, and imides.

2. Diethyl sulphate reacts best, utilising both ethyl groups, with dry reagents, but absolute dryness is not a necessity.

3. Diethyl sulphate reacts in the presence of large amounts of water to the extent of one ethyl group reacting completely, whereas the efficiency of the second ethyl group is somewhat impaired under these conditions.

4. One ethyl group in diethyl sulphate reacts easily and completely at room temperatures under many conditions, but a temperature of about 110° C. has been found more favourable for the most efficient utilisation of this one ethyl group, while a temperature of about 145° C. and a prolonged heating for 3 to 5 hours is essential for the utilisation of the second ethyl group as an ethylating agent.

5. Ethers, both aromatic and aliphatic, are prepared readily in practically theoretical yields, utilising both ethyl groups, by the heating of the corresponding alcohol or phenol in the presence of an alkali. Small amounts of water present are not harmful. When large amounts are present only one ethyl group reacts.

6. Diethyl sulphate reacts vigorously with amines at room temperatures, yielding a mixture of mono- and di-ethylated products, depending upon the conditions of the reaction. Only one ethyl group reacts, the other being transferred to an ethyl hydrogen sulphate molecule, which combines with the ethylated amine to form a water soluble salt therewith. By the use of hydrated lime and heating for a time at temperatures between 140° and 145° C. the second ethyl group may also be utilised to ethylate the amine.

7. Diethyl sulphate reacts favourably to form the ethylated imides, by merely mixing the former in the dry or in a suitable solvent with the alkali imide salt.

8. Many acids, preferably their alkali salts, react readily with diethyl sulphate to form the respective ethyl esters. Yields nearing the quantitative are obtainable in most cases, provided a suitable means is applied to remove the ester as formed and to prevent its hydrolysis. The use of potassium salts gives better efficiency than that of sodium salts.

POTASSIUM PERMANGANATE IN VOLUMETRIC ANALYSIS.

TREATMENT AND CONTROL OF SOLUTIONS.

IN the *Chemiker Zeitung* of July 19, G. Bruhns contributes a lengthy article dealing with the results of his experience in the use of potassium-permanganate solutions for purposes of accurate volumetric analysis. The following summary of his recommendations appears in the *Journal of the Society of Chemical Industry* (September 7, 1923):

Finely crystalline oxalic acid is best used in standardising permanganate solutions, as it occludes no mother liquor and does not effloresce, even over calcium chloride. Large crystals of permanganate were found to be purer than small ones, and the solutions made with them kept better. Bottles and flasks intended for storing standard solutions of permanganate should be first allowed to stand for a few weeks filled with a moderately dilute solution of permanganate before being used for the standard solution. The distilled water used for making up the solution should not decolourise more than 0.7 c.c. of $N/100$ permanganate per 100 c.c. of water.

The solution should not be accurately standardised for about one week after being made up, or alternatively the solution should be heated for several hours on the water bath before standardisation. Precautions to be taken in the use of permanganate for accurate titrations are fully described. Owing to the reducing impurities present in the air of most laboratories, accurate work with permanganate solutions demands the greatest attention to details. If proper care is taken, the standard solutions will keep for years unaltered, even at a dilution of $N/100$. The slight deposit of manganese dioxide which forms in stock bottles may introduce small errors, as it takes as long as 7 hrs. to settle after being disturbed. Permanganate solutions cannot be filtered, even through ignited asbestos, without change in concentration. The purest crystals of potassium permanganate have a bronze colour, the violet and steel blue colours being an indication of incipient surface decomposition. In titrating oxalic acid, the reaction may be started by adding a little manganese sulphate, and warming may be dispensed with.

NOTES ON THE ITALIAN CHEMICAL INDUSTRY.

(From Our Own Correspondent.)

Genoa, August 31.

General News. One hundred thousand workpeople are employed in Italy in 430 chemical works, but at present the activity of the Italian chemical industry is much below the productive capacity of the works. The citrate of lime industry, that has its headquarters in Sicily and in Calabria, and which represents about one-half of the total production of the world, merits special attention. At Messina two new citric acid works—namely, the Sada and Isac works—have been erected. The latter, however, has not yet been able to commence production.

From August 16 the unloading and loading tariffs at Genoa for nitrate of soda have been increased by 50 per cent. The loading tariff for china-clay has been fixed at 3.70 lire per ton, and the unloading tariff at 3.70 lire. For phosphates, the new loading tariff is 3.50 lire, and the unloading tariff 3.20 lire; for superphosphates, the loading tariff has been fixed at 3 lire, and the unloading tariff at 3.20 lire.

Italian Overseas Chemical Trade.—During the latter half of July imports into Genoa included 800 tons of manganese, 240 tons of tallow, 3,400 tons of phosphates, 65 tons of castor oil, 200 tons of cellulose, 3,390 tons of lubricating oils and fats, 1,180 tons of unspecified chemicals, 115 tons of colours and varnishes, 126 tons of sulphur, 469 tons of salt, 2,100 tons of naphtha, and 319 tons of caustic soda.

During the first three months of this year Italy imported 2,067,942 tons of coal, against 1,740,420 tons in the same period of 1922; 41,383 tons of residues from the distillation of mineral oils, against 41,068 tons in 1922; 28,880 tons of petroleum, against 21,930 tons in 1922; 14,874 tons of benzine, against 22,410 tons in 1922; and 13,400 tons of mineral lubricating oils, against 18,892 tons in 1922. Some of the exports were as follows: Sulphur, 56,339 tons, against 36,434 tons in 1922; and essential oils and essences, 299,617 kilos., against 235,989 kilos. in 1922.

Italian Production Statistics.—During 1922 Italy produced 630 tons of aluminium, against 740 tons in 1921, 1,715 tons in 1918, 904 tons in 1915, and 824 tons in 1912; 6,700 kilos. of ingot silver, against 6,878 kilos. in 1921, 10,115 kilos. in 1918, 15,361 kilos. in 1915, and 14,363 kilos. in 1912. During the period 1921-1922 the production of methylated spirits was 76,735 hectolitres, against 63,753 hectolitres in 1920-1921; 40,179 hectolitres in 1918-1919, 93,503 hectolitres in 1915-1916, 123,981 hectolitres in 1912-1913, and 94,732 hectolitres in 1909-1910. Of absolute alcohol (100°), 442,359 hectolitres were produced, against 428,644 hectolitres in 1920-1921, 299,912 hectolitres in 1917-1918, 297,964 hectolitres in 1914-1915, 260,632 hectolitres in 1911-1912, and 418,921 hectolitres in 1909-1910.

Petroleum News.—Negotiations are in progress for the concession to an Italian-Belgian company of 8,000 hectares of virgin petroliferous territory in Russian Georgia. The expenditure incurred by the Italian State in the search for petroleum in Italian territory during the period July, 1918, to May, 1923, reached a total of 10,783,553 lire. The investigations have been confined to the Ripi zone in Frusinate. The oil produced during the period of Government control of Ripi totals 400,000 litres. Attempts are now being made to transfer the operations to the hands of private companies, who will meet all the expenses, the Government supplying only the boring plant. In case of success, the private companies will have the option of acquiring the complete rights over the deposits. The Government will leave a number of other zones completely to private initiative.

American Loans.—An American financial corporation, the Mantell Investment Company of New York, has forwarded to various public corporations in Italy a circular in which it offers to finance the development of the civic and other social services. The loans proposed will be from five to fifty years' duration, and will be granted mainly on mortgage, and the borrowers will pay a yearly interest of 6 per cent. The loans will be made in dollars, and their repayment can be also in dollars, or in Italian lire, at a determined exchange rate of 19.50 lire to the dollar.

Company News.—At Leghorn, the firm of Fabbrica Italiana Magnesiaci De Amici, Jori e Parlanti, has been formed, with a capital of 60,000 lire, for the production of and trade in magnesium compounds. The "Industria Chimica Subalpina" was formed at Chieri, with a capital of 60,000 lire, for the production of and trade in general chemicals. The "Stabilimenti Estratti Tannici Società Anonima" has been established at Cividale (Veneto), with a capital of 700,000 lire, for the production on a large scale of tanning extracts, and especially of chestnut extract. The "Società Esercizio Oleifici" is a new Milan company, with a capital of 10,000,000 lire, for trading in olive-oil products. At an extraordinary meeting the "Società Anonima per la Distillazione del Legno," of Milan, decided to reduce its capital from 600,000 lire to 6,000 lire. At an extraordinary meeting of the important Società Anonima Raffineria di Olii Minerali, of Fiume, increase of the capital from 5,000,000 lire to 15,000,000 lire was considered. During the past financial year of the Industria Siciliana Acido Citrico, of Messina, a loss of 1,115,845 lire was recorded. The Società Solfifera Siciliana, of Milan, has decided to reduce its capital to 3,200,000 lire from 8,000,000 lire.

CASEIN IN THE PAINTS INDUSTRY.

USE AS A BINDER IN DISTEMPERS.

(*Concluded from page 252.*)

THE preparation of paints from casein dry colours is simple enough, though a little care is required. A mixer provided with a mechanical agitator is advisable, and the operation of mixing is commenced by placing the colour powder into the vessel. To every 50 kilogrammes of powder there is added gradually 25 litres of water, with constant agitation. The mixing is continued until an absolutely homogeneous paste is obtained. The stirrer is then stopped, and a layer of water about 1 centimetre deep is run on to the top of the paste. The whole is left undisturbed for one hour, and then the mixing recommenced, with the gradual addition of further water, until the resultant product has the consistency of average oil paint.

In the use of casein paints there is one point that must not be overlooked. When once prepared, they begin after 12 hours to lose their adhesiveness, and a quantity greater than is intended to be used in the course of a day should never be prepared.

When applied efficiently, the coating of casein paint dries rapidly, and after 48 hours they are usually quite hard and can be washed over with water. They are sufficiently flexible and elastic to be varnished over. The surface of the paint is matte, but can be brightened for purposes of interior decoration by spraying over it a solution of 10kilos. of pale carnauba wax and 5kilos. of bleached beeswax in 110kilos. of turpentine.

Addition of Magnesium Silicate.

For exterior painting it has been found that the addition of magnesium silicate to the casein paint gives coatings almost as resistant to atmospheric conditions as oil paints. A typical base formula for this purpose would be:—

Soluble casein	15kilos.
Hydrated lime	20kilos.
Precipitated chalk	10kilos.
Sodium borate	0.15kilo.
Magnesium silicate	110kilos.

The preparation of this paint is similar to that of those described above, and it is applied in the same manner. The coatings obtained are fast to water, hard as enamel, and can be washed over or varnished 48 hours after application. The use of this type of magnesium silicate casein water paint is particularly advisable for covering large surfaces, such as public halls, railway stations, theatres, churches, and hospitals upon all materials such as wood, cement, stone, and brick, but not iron or other metals.

The majority of casein paints contain also a certain amount of antiseptic, added not only to preserve the paint itself before application, but also to preserve it when coated over damp surfaces or in places where considerable humidity prevails.

FRENCH ARTIFICIAL SILK INDUSTRY.

NEW SCHEMES FOR EXPANSION.

IN spite of the rapid growth in recent years of the French artificial silk industry, the output, which is estimated at 1,500 tons yearly, is far below the consumption, and lately the excess of imports over exports has been steadily increasing. At present the "viscose" artificial silk appears to be more favoured than "Chardonnet" silk, states a correspondent of the *Times* (Trade Supplement). Hitherto most of the artificial silk mills were situated in the South of France, mainly in the Rhône Valley—Albi, Besancon, Chavanoz (Isère), Flaviac (Ardèche), Vals-les-Bains (Ardèche), Voult-sur-Rhône (Ardèche), Arques-la-Bataille (Seine-Inférieure). The building of a new mill at Castres (Tarn) is nearly finished, and the erection of two mills in Normandy is contemplated. Further, the Société Borvisk Française has just been formed with a capital of 10,000,000f. for the purpose of manufacturing artificial silk and all cellulose products. In addition to these new enterprises, there is a movement in favour of the extension of the artificial silk industry in the North of France, where, up to now, this branch of French activity has been very little developed. In fact the Nord and Pas-de-Calais departments contain all sections of the textile industry with the exception of artificial silk, although it is used largely in their factories. The netmakers of Caudry, the lacemakers and embroiderers of Calais and Saint Quentin, are bound to follow the requirements of fashion, and are using artificial silk in increasing quantities. This material is bought either in other departments of France or in Belgium. By establishing additional mills, not only in the neighbourhood of Lyons, but also in Northern France, it is hoped to bring prices down. Three companies are now engaged in preliminary work, which, if successful, will result in the establishment in the Nord region within two years of three viscose mills. One would be built at Valenciennes by Roubaix manufacturers. The Société Tubize, Belgian manufacturers of Chardonnet silk, are now looking for a town in Northern France where sufficient labour could be found to operate a new viscose silk mill. A viscose silk factory is also to be built at Gauchey (Aisne).

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Alseveor China Clay Company, Ltd., St. Austell.—Registered August 24, deb., to Lloyds Bank, Ltd., securing all moneys due or to become due to the Bank.

Aluminium Corporation, Ltd., London, S.W.—Registered August 23, £300, mort., to G. Williams, Regent House, Talybont.

Austin and Son (Nechells), Ltd., chemists, etc.—Registered August 23, £669, 17s, deb., to A. J. Corrall, 395, Nechells Park Road, Birmingham.

Mordle (F. Dare) and Co., Ltd., Nottingham, starch manufacturers.—Registered August 27 (by order on terms), transfer of mort. dated February 22, 1922, securing £4,000., to H. J. Hallam, Low Pavement, Nottingham.

Needwood Plaster and Cement Company, Ltd., Burton-on-Trent.—Registered August 28, £1,800, debs.

Taylors' Drug Company, Ltd., Leeds.—Registered August 27, £800, mort., to Mrs. E. Speight, 101, Harrogate Road, Leeds, and others.

Welsh Drug Houses, Ltd., Mountain Ash.—Registered August 27, £600, debs.

SATISFACTIONS.

Carter (John J.) and Sons, Ltd., Southampton, dyers, etc.—Satisfaction registered August 22, £100., part of amount outstanding July 1, 1908.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Goddon and Co., Ltd., London, W.C., manufacturing chemists.—J. W. Dodds, Boxmoor House, Boxmoor, apopinted receiver August 23.

North of Ireland Chemical Company, Ltd.—Claims to H. Bell, 2, Wellington Place, Belfast, liquidator, by October 12.

Veglene Oil Refinery and Chemical Works, Ltd., Cardiff.—E. S. Foden, 15-16, Merchants Exchange, Docks, Cardiff, appointed receiver. August 27.

BANKRUPTCY INFORMATION.

Keene, Irving A., described in R.O. as the Keene Company, 52, Gray's Inn Road, London, manufacturing chemists. 1st and final dividend, 3s. 6½d., at 28, Kimberley House, Holborn Viaduct, London, September 12.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Blunt, W. H., and Son, 79, Snow Hill, Birmingham; manufacturing chemists; £16. 11s. 9d., July 17; and £10. 13s. 10d., July 25.

Tomlinson, Herbert, 7, Alexander Terrace, Undercliffe, Bradford; analytical chemist; £20. 11s. 6d. July 26.

Wenyon, Conrad G., 58, Bankfield Road, Huddersfield; analytical chemist; £15. 10s. 6d. June 29.

SOUTH WALES NOTES.

[Specially Contributed.]

Business in the tinplate trade remains very steady, and there is a slight increase in the orders coming in from the Far Eastern markets. The general position of the industry, in the opinion of merchants, warrants further reductions in prices, and they are holding back before finally signing contracts for over the current quarter. On Tuesday the Joint Stabilisation Committee decided, however, to make no change in the prices. The steelworks have not anything like the number of orders for all the works to operate to their full strength, and in some districts there is only partial employment. The Briton Ferry steelworks have stopped operating, in order to put in a more modern plant, which will take some six or eight weeks to instal. Generally, the patent-fuel trade is none too active. The decline in values of pitch is having some effect, but as yet manufacturers are not disposed to relax their prices any further. Cokes are more plentiful, and with a lessened inquiry stocks are slowly accumulating. The outlook in copper is now much brighter, and there are important sales noted for Continental purchasers. Nickel makers are fairly well employed. Manufacturers of heavy chemicals report better conditions, and employment at the oil works has strengthened.

Among the week's imports to Swansea were 4,000 tons zinc concentrates from Port Pirie and 13 tons calcium carbide from Rotterdam; to Cardiff, 15 tons lithopone from Antwerp, and 1,160 tons asphalt from Trinidad. Exports included 2,000 tons creosote to Savannah from Cardiff, and three tons zinc chloride from Newport to Calcutta.

NEW COMPANIES.

Cyanamid Products, Ltd.—Private company. Capital £5,000., £100. shares. Manufacturers, refiners, and dealers in cyanamide and other chemical products, etc. Office: 232, Salisbury House, London Wall, London, E.C.

H. Edward Hope and Co., Ltd.—Private company. Capital £7,600., £1. shares (6,000 5 per cent. cumulative preference and 1,000 ordinary). Paint and varnish manufacturers, etc. Office: 21, Lower Mall, Hammersmith, W.

H. Edwin Coley, Ltd.—Private company. Capital £21,500., in 30,000 A ordinary shares of 1s., and 40,000 B ordinary and 10,000 10 per cent. participating preference shares of £1. Mineralogists, metallurgists, etc. Office: 6, Bury Court, St. Mary Axe, London, E.C. 3.

Pharmaceutical Supply Company, Ltd.—Private company. Capital £3,000., in 2,985 6 per cent. cumulative preference shares of £1, and 300 ordinary of 1s. Solicitors: Cohn, Seligman and Bax, 52, New Broad Street, London, E.C.

Industrial Products, Ltd.—Private company. Capital £5,000. Manufacturers of electrical compounds and special paints. Office: 17, Herschell Street, Anniesland, Glasgow.

Jamaica Sugar Syndicate, Ltd.—Private company. Capital £35,000. Office: 116, Hope Street, Glasgow.

ITEMS OF INTEREST.

Safety in Mines.—The first general Report of the Safety in Mines Research Board has been published and is now on sale, price 9d.

Change of Address.—The Rosario Nitrate Company, Ltd., announce that the registered office of the company is now 145, Dashwood House, New Broad Street, London, E.C. 2.

Obituary.—We regret to record the death of Mr. A. E. Rice, on August 26, at Yellowstone, U.S.A. He was president of the Pennsylvania Salt Manufacturing Company, with which he had been connected since 1888.

German Dyestuff Production in July.—According to an American Consular Report, the production of coal-tar dyestuffs in Germany for the month of July totalled 9,032,286lb., including 366,855lb. of alizarin red and 236,677lb. of vat colours.

Middlesbrough Steelworks Fatality.—Five men lost their lives and several others were seriously injured in an accident on Saturday last at the North-Eastern Steel Works, Middlesbrough. A rope attached to a ladle broke, and the men working near were caught under a shower of molten metal and slag.

Disposal of Belgian Reparation Dyestuffs.—We are informed that the Société Anonyme de Couleurs d'Aniline et Produits Chimiques S.A.C.A., 60, Rue de Mérode, Brussels, have been appointed by the Belgian Government, sole distributors of the aniline dyes seized in the German factories as reparations.

American Chemical Exposition.—The forthcoming exposition, to be held from September 17 to 22, will be the last annual event, exhibitors having expressed a preference for a biennial exhibition. The new one will take place in 1925. It is stated that these annual expositions have never fully met the expectations of some of the early promoters.

Trade Mission to South America.—An important commercial mission has been arranged by the Federation of British Industries to South America, headed by Mr. G. H. Locock, an assistant director of the Federation. The itinerary embraces Brazil, Uruguay, Argentina, Chile, Bolivia, Peru, Ecuador, Colombia, Venezuela, Panama, and Cuba.

American Cyanamid Progress.—The American Cyanamid Company reports for July that at the New Jersey plant the production of ammo-phos was at the rate of 20 per cent. of capacity, and, in addition, there was continued the manufacture of certain secondary products. At the phosphate mines in Florida operations were at a rate somewhat less than capacity, while at the Niagara Falls plant operations were upon the basis of full capacity.

August Trade Returns.—The Board of Trade figures for August show imports at £88,743,000, against £76,818,000, in July and £82,616,000, for August, 1922. British exports totalled £69,103,000, compared with £59,504,000, in July and £60,032,000, in August last year. The figure for re-exports at £6,129,000, was the lowest since before 1921. Imports of chemicals amounted to £1,315,825., an increase of £190,804, compared with last year; exports were lower at £1,645,856, by £16,753.

Cochineal Insects Check Prickly Pear. — Imported cochineal insects are reported to have made some headway in checking the prickly pear invasion of Australia. Since the plant was first introduced 60 years ago, it has spread over 40 million acres of fertile lands in Queensland and New South Wales. Industrial use of the weed and Government bonuses for clearing it from the land have had little effect in staying its progress. Insect control is sought as a last resort, but with a risk that a new pest will be established.

Dyestuffs Applications During August. — The total number of applications received by the Dyestuffs Advisory Licensing Committee during August was 391, of which 269 were from merchants or importers. To these should be added the 29 cases outstanding on August 1, making a total for the month of 420. These were dealt with as follows:—Granted—282 (of which 248 were dealt with within seven days of receipt). Referred to British makers of similar products—74 (of which 63 were dealt with within seven days of receipt). Referred to Reparation supplies available—30 (all dealt with within two days of receipt). Outstanding on August 31—34. Of the total of 420 applications received 341, or 81 per cent. were dealt with within seven days of receipt.

Mining and Metallurgy Congress.—The Prince of Wales has consented to become Honorary President of the forthcoming Empire Mining and Metallurgical Congress, which will be held at the British Empire Exhibition in London during the first week in June next.

British Coal Output.—The coal output for the mines of Great Britain during the week ended September 1 was 5,280,600 tons, compared with 5,163,800 during the previous week and 5,203,600 tons during the corresponding week last year.

Canadian Output of Salt and Gypsum.—According to the Dominion Bureau of Statistics, the output of salt from all sources in Canada during 1922 totalled 183,438 tons. The total output of gypsum rock during the year amounted to 484,629 tons, of which quantity 145,954 tons, or 30 per cent., was calcined.

Explosion in New Jersey.—Four people were killed and twenty-seven injured, fifteen probably fatally, states *Reuter*, in a series of explosions of a thousand cases of smokeless powder, which were being transferred from barges to railway wagons. The first explosion was due to a fire originating in one of the barges.

Congress of Industrial Chemistry.—The Société de Chimie Industrielle has invited members of the American Chemical Society to attend the third Congress of Industrial Chemistry to be held at Paris, October 21 to 26. The American chemists are also invited to contribute papers and to take part in the discussions.

The U.S. Coal Strike.—The representatives of the miners and mine-owners in the anthracite fields of Pennsylvania have signed a two-year contract embodying a ten per cent. increase in wages, and the eight-hour day. The contract is subject to the approval of the Miners' Convention, to be held on the 17th inst. The men's leaders are confident that operations will be resumed on the 19th.

Synthetic Jewels.—There are several factories in Switzerland turning out large quantities of synthetic precious stones—rubies—for watches, electric meters, measuring instruments, etc. The possible annual production has been put at 125,000,000 carats, but in fact production, limited by demand, is much lower. Owing to hardness and uniformity of structure it is stated that 90 per cent. of all watch stones and 50 per cent. of stones for meters, etc., are made of synthetic material. The average price of synthetic rubies is about £10. per kilogramme—unworked—and £150. when cut. Synthetic blue sapphires cost £24. uncut and £400. cut.

U.S. Commerce Bureau.—In the 11 years which have elapsed since the organisation of the American Bureau of Foreign and Domestic Commerce its personnel has increased from 89 to 935, its appropriations for regular work from 363,000 dollars for 1913 to 2,076,000 dollars for 1924, and the number of trade inquiries from a few thousand in 1913 to 974,000 in 1923. A notable addition to the Bureau's publications during the current fiscal year will be the first issue of a new annual Commerce Yearbook, preparation of which is now nearing completion. This volume will present a comprehensive survey of trade and industry during 1922 and the first six months of 1923 in the United States and in foreign countries.

Acetic Acid in British Malaya.—In 1921, Canada furnished almost 50 per cent. of the acetic acid imported into British Malaya, but by 1923 she altogether ceased to compete in the market. The bulk of the acid is now supplied by European continental countries. Details as to the respective quantities exported by the different countries of the Continent in 1922 and 1923 are not yet available, but in 1921 the Netherlands and Germany were the only two European continental countries exporting the acid to Malaya. The following table gives the value of acetic acid imported into British Malaya in 1921, 1922, and the first half of 1923, showing countries of origin:

	1921	1922	1923 (6 months)
	£	£	£
United Kingdom	390	7,920	4,792
British Possessions	11,332	540	—
Continent of Europe	3,819	80,347	52,213
U.S.A.	5,565	751	1,017
Japan	2,366	29,121	4,450
Other Countries	—	245	—
Total	£23,472	118,924	62,472

Biological Chemistry in America. — The American Chemical Society announces that a trust fund for establishing a Fellowship in biological chemistry in the College of Physicians and Surgeons, Columbia University, to be named in honour of the founder, Professor W. J. Gies, will be presented at the twenty-fifth anniversary of that department on October 1.

Tariff Notes. — Certain rebates on the Customs duties leviable on salt, turpentine, eucalyptus, pine, and certain other oils, soya bean oil, citronella and mirbane oil, various waxes, and linseed oil have been allowed on importation into South Africa. — Oil-shale distillation machinery and apparatus, except mining machinery, may be imported into Esthonia free of duty from September 1, 1923, until February 1, 1924, under certificates of the Esthonian Ministry of Trade and Industry.

British Unemployment Increasing.—The number of persons on September 3 recorded on the live registers of the Employment Exchanges in Great Britain as wholly unemployed was 1,233,300. This was 5,130 more than in the preceding week, but 252,578 less than the figure recorded on January 1, 1923. The number working short-time and drawing benefit for intervals of unemployment was 72,800 on September 3, as compared with 67,993 on August 27, and 56,261 on January 1, 1923.

Oil Separator for the Clyde.—To meet the provisions of the Oil in Navigable Waters Act, which recently came into operation, the Clyde Navigation Trust have followed the lead of other port authorities in England, notably the Port of London Authority, and decided to instal a floating oil separator. Smith's Dock Company, of the Tyne and Tees, who have carried out contracts at home and abroad for their special oil separating barge, have secured the contract, which will be put in hand immediately.

Detecting Subterranean Water and Minerals.—A considerable amount of investigation has been carried out recently in the Laboratory of the Science Museum, South Kensington, on a remarkable instrument known as the Eötvös Torsion Balance. This instrument is fundamentally a very delicate apparatus for measuring minute differences in gravity pull at different points on the earth's surface. It is believed that the instrument will be of great practical value in detecting oil, water, or minerals many feet below the earth's surface.

Personal.—Dr. Andrew Balfour, for the past ten years Director-in-Chief of the Wellcome Bureau of Scientific Research, London, resigns that position on October 31. He will be succeeded by Dr. C. M. Wenyon, who for the past nine years has been Director of Research in the Tropics at the Wellcome Bureau of Scientific Research.—Dr. Alfred Rée has been elected this week a vice-president of the Manchester Chamber of Commerce in succession to Sir Edward Rhodes. Dr. Rée is a past president of the Society of Dyers and Colourists.

Inquest on Rubber-Mixer's Death.—At an inquest held in Manchester this week on the death of Patrick Hanley, a rubber mixer employed at W. T. Glover's works in Trafford Park, a verdict of "death from natural causes" was returned, the immediate cause of death being found to be cancer of the stomach. Interest attached to the case since the deceased had employed for some time in his work an aqueous paste of "accelerene" (the proprietary name of para-nitroso-dimethylaniline—a rubber vulcanisation accelerator), and it was thought that the toxicity of this material might have been a contributory cause to the man's death.

Electrolytic Fur-Dyeing Process.—According to the *Deutsche Farber Zeitung*, a new method of electrolytic oxidation of dyestuffs in the dyeing of furs has been introduced in Germany. Ordinarily, the compounds sold and used under the names "Nako" "Ursol," "Furrol," and so on, are oxidised in the dyer's bath with peroxide of hydrogen. With the electrolytic process, furs can be dyed with aniline salts without the usual damage to the skin from the chlorates used in developing aniline black. The electrolytical oxidation of the aniline black produces a deep black without green shading, superior to any other fur black in lustre and durability. In seal dyeing particularly favourable results obtain, the skin remaining soft and pliable and the fur having a fine lustre. The colour is fast and highly resistant to alkalis and acids. Much time is saved in the new process, which is also cheap and easily controlled.—*Oil, Paint, and Drug Reporter* (New York).

Iron Ore in Ontario.—The special committee appointed by the Ontario Government to investigate the iron ore industry of the province recommends that the industry be encouraged and developed by a bounty for ten years, half to be paid by the province and half by the Dominion; also that a properly qualified geologist be permanently assigned to the work of studying and reporting on Ontario iron ore deposits. The committee recommends that the section of the Mining Act prohibiting the export of iron ore be repealed in order to encourage the entrance of foreign capital for developing this industry.

Carbon Black Production in America. — The quantity of carbon black produced from natural gas in the United States in 1922 amounted to 67,795,000 pounds, over 13 per cent. more than in 1921, according to a statement issued by the Department of the Interior through the Geological Survey. Increased demand for carbon black during the latter half of the year, especially by the rubber industry, required practically all the product of the year, and, in addition, between 12 and 15 million pounds that had been held in storage. Increased demand was reflected by a rise in spot prices. The reported average price realised for the year at works was 8.6 cents a pound.

The Toxicity of Arsenical Insecticides. — A thorough investigation of a number of commercial arsenicals and laboratory preparations is described by F. C. Cook and N. E. McIndoo (U.S. Dept. Agric. Bull. No. 1147, 1923), together with analyses, toxicity tests, compatibility of mixtures, etc. Acid lead arsenate was found to have a greater toxicity than "basic" lead arsenate. Samples of calcium arsenate varied considerably. The addition of lime or Bordeaux mixture considerably lowered the toxicity of arsenates. Acid lead arsenate and zinc arsenite were the most adhesive to potato foliage, and Paris Green the least adhesive. Paris Green and zinc arsenite were more toxic than acid lead arsenate, which in turn was more toxic than the arsenates of other metals. The percentage of water-soluble arsenic in arsenical insecticides had little influence on their toxicity, except in the case of freely soluble ones. Chemical analysis alone is considered insufficient to determine the insecticidal value of arsenicals; direct toxicity tests should be made in addition. —*J.S.C.I.*

COMING EVENTS.

British Association. — Annual meeting, **September 12-19,** at Liverpool. On **Friday, September 14,** presidential address to Chemistry Section: "The Physical Chemistry of Interfaces," by Professor F. G. Donnan. Papers before Chemistry Section: "The Quantum Theory in Chemistry," by Professor G. N. Lewis; "The Bohr Atom and the Periodic Law," by Dr. N. V. Sidgwick; "On High Frequency Spectra and the Theory of Atomic Structure," by Dr. D. Coster; "The Activation of Hydrogen in Organic Compounds," by Miss Usherwood; "The Nature of Hevea Rubber," by Professor G. S. Whitby. On **Monday, September 17,** "Enzymes," by Dr. E. F. Armstrong; "Relation of Certain Enzymes to Tissue Differentiation and Tumour Growth," by Dr. K. G. Falk; "Catalytic Actions in Presence of Copper," by W. G. Palmer; "Aluminosilicates," by Professor W. Vernadsky; "The Chemistry of Hafnium," by Dr. Hevesy. On **Tuesday, September 18,** "The Utilisation of Volcanic Steam," by Senatore G. Conti; "The Biochemical Effect of Polarised Light," by Miss Semmens; "Cotton Wax," by Dr. R. G. Fargher; "The Absorption of Methylene Blue by Cotton," by Dr. D. A. Clibbens; "The Sulphonation and Nitration of Naphthalene," by Professor H. E. Fierz. Visits to the works of Prices Patent Candle Company, the British Oxygen Company at Bootle, and Joseph Crosfield and Sons have been arranged for Friday, Monday, and Tuesday afternoons respectively.

Institution of the Rubber Industry.—Meeting, **Monday, September 17,** at **8 p.m.,** at the Engineers' Club, Coventry Street, London, W. Paper: "Rubber Floors and Rubber Roadways," by E. J. Edwards

Iron and Steel Institute.—Autumn meeting, **Monday and Tuesday, September 17** and **18,** at Milan.

National Gas Exhibition.—From **September 17** to **October 3,** at Birmingham.

Chemists' Exhibition.—From **September 17** to **September 22,** at St. Andrew's Hall, Glasgow.

REPORTS OF COMPANIES.

Calico Printers' Association, Ltd.

The accounts show that the profits for the year to June 30 last, after providing £597,305. for maintenance, depreciation, repairs, renewals and upkeep, and £128,000. for debenture interest, amount to £800,208.; add amount brought forward from last account, £237,371., making £1,037,579. The directors recommend that this balance should be appropriated in the following manner:—To payment of a dividend at the rate of 5 per cent. per annum on the preference shares for the year ended June 30, against which the directors have declared and distributed an interim dividend on March 31 for the half-year ended December 31, 1922, £150,805.; to payment of a dividend on the ordinary shares for the year ended June 30 at the rate of 10 per cent. per annum, £201,073.; to payment of a bonus on the ordinary shares for the year ended June 30 at the rate of 2½ per cent., £50,268.; to reserve account, £150,000.; to reserve for equalisation of dividends, £150,000.; to employees' benefit fund, £100,000., leaving a balance to be carried forward of £235 432.

Burt, Boulton and Haywood, Ltd.

Report for half-year to June 30 states that the past six months have more than maintained the improvement in the company's affairs since the great slump. The board have decided to issue to the shareholders the balance of the unissued capital of the company, and the terms on which these shares will be offered will be communicated to them in due course. The net profit earned during the six months, after writing off £10,000. to depreciation, amounts to £43,720., to which amount must be added £2,398. brought forward. From this total £246. must be deducted to provide payment in respect of workers' certificates. The shareholders will be asked to vote £14,960. for the payment of 4 per cent. dividend, free of tax, on the ordinary shares, making 8 per cent. free of tax for the company's year from July 1, 1922, to June 30, 1923, and to sanction the carrying of £20,000. to reserve, leaving £10,162. to be carried forward.

Nobel Industries, Ltd.

The gross profits for the year ended December 31 last were £1,157,137. (as compared with £809,242. in 1921). After providing £176,999. interest (less tax) paid and accrued to December 31, 1922, upon the eight per cent. seven year secured notes, the balance was £980,138. There is deducted £37,236. to write off the cost of note issue, leaving a net profit of £942,901. (against £604,264). The balance brought forward was £463,349. After allowing for the preference dividend for the year it is proposed to pay a dividend of 7 per cent. on the ordinary shares (against 5 per cent.), less tax, to write off the balance of "cost of eight per cent. note issue," the notes having been repaid in May, 1923, £148,945., and to carry to reserve £50,000. (against £350,000.). The credit balance carried forward is £509,018.

Elliott's Metal Company, Ltd.

The report for the year ended August 4 states that after paying debenture interest and providing for corporation tax there remains a profit of £85,553., to which is added £26,865., the balance from 1922, making a total of £112,418. The directors propose to pay a dividend at the rate of 3s. per share on the ordinary shares, less tax (of which an interim dividend amounting to £22,149. has already been paid); to write off balance of expenses of fusion with Muntz's Metal Company, £1,805.; and carry forward £32,904.

DIVIDENDS.

Aberthaw and Bristol Channel Portland Cement Co., Ltd.—The directors have decided to pay interim dividends of 3¾ per cent. on the 7½ per cent. preference shares and 7½ per cent. on the ordinary shares (both less tax), in respect to the year ending December 31.

Broken Hill (South), Limited.—Net profits for the past year were £322,000., and appropriation for new land and developments £80,000.

North Broken Hill Company, Ltd.—To the dividend of 2s. per share, declared in August, there is to be added 1.56d. per share, being balance of relief in respect of Dominion tax applicable to dividend paid June 27, thus making a net distribution of 1s. 9.72d. per share.

Zinc Corporation, Ltd.—Dividend of 2s. per share on preference, being first half of fixed preferential dividend of 20 per cent. for 1923.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

The resumption of operations at the Whitehaven collieries and coking plants at the termination of a dispute which has lasted seventeen weeks comes at a time when all the industries of the district—iron, steel, iron-ore and coal-are in a depressed condition. There is little information available as to the likelihood of steel makers receiving sufficient orders to put their rail mills into full or even partial operation, although it is stated this week that the outlook is a little more hopeful. Other outlets for the disposal of the make of iron are not large. Neither Continental nor home consumers are buying more iron than they need, and then from hand to mouth, and in the southern portion of the district stocks are accumulating so quickly that a decision will soon have to be taken as to whether all the furnaces now blowing can be kept in blast. Should output have to be diminished then a material increase in the Continental demand for coke will have to be experienced if the native make is to be marketed. The damping down of a furnace or two in the Furness district would clearly deprive the Whitehaven ovens of their ordinary outlet. The West Cumberland ovens send the greater part of their production to the Workington and Cleator Moor furnaces, and in the West Cumberland district the number of furnaces in draught is at present seven. There is no change in prices, local smelters paying from 29s. to 33s. per ton according to carbon content, while the Continent is paying from 34s. to 37s. per ton. It is hoped that the Continental outlet will become more important in the autumn and winter, and it is stated that shipments will presently be on a more substantial scale. The depression in the iron and steel industries is affecting the demand for industrial fuel, and this market is rather slack. Best steam, however, still commands 30s. per ton delivered and washed steam 29s. per ton delivered. There is a big Irish demand for house nuts at 26s. and for washed nuts at 23s. 6d., but these classes of coal and smalls are being in the main reserved for the coking plants. Residuals are all being marketed. The tar is going to the chemical works, and the make of crude benzol and sulphate of ammonia is being absorbed. Chemical products are a fair trade. East Coast coke supplies this week are 8,100 tons.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," September 15, 1888.)

The Innocents Abroad.—In numerous instances the statues in the hall of the Brunner Free Library, Northwich, have been taken by inhabitants of the Emerald Isle, and in some cases by English people, too, for Northwich worthies and other persons quite different from those whom they are supposed to represent. Especially is this the case with respect to the central figure—a life-size representation in marble of England's greatest bard, Shakespeare,—who is very frequently taken for the donor of the handsome institution. The remarks passed by such visitors when in the hall are very amusing, but a description which was given of the statues on Wednesday evening is the best we have heard of. An Irishman who has been in Northwich for some years was showing two recent importations from the sister isle the various figures and describing them, when he proceeded to enlighten his two companions upon Shakespeare as follows: "Ah, this is the gintleman. I've worked for him thirteen or fourteen years, and he's a gintleman. I know him well, and, faith, it's a good likeness, too." One of the others replied, "God bless him, and is that Mr. Brunner?" These ardent admirers of the member for Warrington then turned their attention to "The Two Wrestlers" on the left of the entrance going in, whom their guide informed them were Cain and Abel. "This man has got his head down, looking at his thick leg," was the description given of "The Dying Gladiator"; and "Mercury" was "the great slave driver, a relation of King Herod, that ordered all the small children to be destroyed. His arm was struck off when slaughtering the children." This interesting native of Erin, however, gave the most amusing description when he said "Jupiter" was Mr. Brunner's partner, Mr. Mond. The credulity of these innocent Irishmen stands out in bold contrast to the tactics adopted by Mark Twain and his friends with respect to their guides. Evidently, the schoolmaster was very far abroad when these Irishmen were boys.

FERTILISER NEWS.

Nitrate of Soda.—The shipments from Chile during the month of August totalled 212,000 tons, of which 130,000 tons to Europe and Egypt, 69,000 tons to the United States, and 13,000 tons to Japan and other countries. When compared with 1922 and 1921, these figures show a considerable increase, but the large stocks of nitrate in the consuming centres during these years did not allow of large shipments so early in the season. While exports are large, however, the market has lately been very dull, although it is stated that there has been a revival during the past few days. Sales have assumed larger proportions, and the total amount of nitrate sold for shipment after July 1 last is now given as about 944,000 tons. The few thousand tons of second-half November delivery which were available at the end of August at the Association's price of 20s. 7d. per metric quintal have since been sold, so that the cheapest material on offer at first hand is for December delivery at 20s. 9d. per quintal. As was forecasted in this column last week, the estimated production during August has been considerably modified, and the cabled figure as quoted by one of the leading brokers, amounts to 165,000 tons. On this basis, and allowing for the alteration in the export figures, the total visible supply of Chilean nitrate at August 31 amounts to 1,426,000 tons, of which 939,000 tons are on the West Coast, 310,000 tons in or en route for Europe and Egypt, 140,000 tons for the United States, and 37,000 tons for other countries. On Monday last, the regretted death occurred of Mr. George A. Lockett, a well-known figure in the nitrate industry. Born in Liverpool 68 years ago, he was the fourth son of the late Mr. Richard Lockett, who, with Colonel J. T. North, and Sir Robert Harvey, was one of the pioneers of the industry. He had a first-hand knowledge of nitrate trading conditions, having frequently visited the Chilean nitrate grounds.

Sulphate of Ammonia.—The home market for this fertiliser continues to be very quiet, and although there is a little business passing, it is of such small dimensions as to arouse little comment. Of interest, now, unfortunately, mainly historical, is a report received this week from our Japanese correspondent at Osaka, under date of August 15. He states that at the time of writing there was something in the nature of a slump in the price of sulphate. In the early part of the year, heavy commitments were entered into with British exporters, and it is said that many of these purchases were of a speculative character. The demand, in the face of very unfavourable weather conditions during July and August which have had an adverse effect on the crops, has been considerably delayed. Consequently, importers have been reducing prices to a certain extent in order to encourage consumers. Dealers who had indulged in speculative purchases, contracted for at about yen 200 per ton, have been endeavouring to get rid of the material at prices as low as yen 140 per ton for immediate delivery. The market, therefore, at the time of writing, was in a very low condition, with little prospect of early recovery. It is impossible, of course, to forecast what effect the recent disaster in Japan will have upon the industrial and agricultural life of the country. Yokohama, the chief port, has, according to the information available, been completely destroyed, and although stocks of sulphate in Osaka and Kobe at August 15 were over 6,000 tons, it is not known how much sulphate was stored at Yokohama. Up to the end of July, the total amount of sulphate despatched from this country to the Japanese market amounted to 28,664 tons, while shipments during August account for a further large tonnage. Reports from the United States announce that the miners' strike has been settled, and that a speedy resumption of work is anticipated. The success of the British producers of sulphate in the markets of the world has caused some concern to the American exporters. Vague talk about the control of a "trust" which would be "considered illegal" in the States, and the "undercutting" in prices, indicates the feeling which exists, and the implication of all this grumbling is that Great Britain has secured an unfair advantage. It is probably nearer the mark, however, to infer that the American merchants and producers, having forced domestic prices up to a very high level—about £18. per ton—find it difficult to lower their prices for such export material as is available in case it should arouse unfavourable comment, and action, amongst the home consumers.

American Fertiliser Exports in 1923.—Exports of fertilisers and fertiliser materials during the period January 1 to June 30, 1923, amounted to 550,953 tons valued at 11,382,529 dollars, which compares with 496,801 tons, valued at 9,423,504 dollars in the corresponding period of 1922. Sulphate of ammonia exports decreased by 3 per cent. in quantity, but increased by 21 per cent. in value, largely due to the shortage and consequent raising of prices. This shortage was particularly acute during the first quarter of 1923. The Far East, including Japan—which took nearly two-thirds of the total shipments—offered the best market, while much of the remainder was taken by Cuba, a comparatively near market. In addition to sulphate, some 19,050 tons of other nitrogenous fertilisers, valued at 968,014 dollars were exported during the six months. In spite of the unsettled conditions prevailing in the phosphate market the 396,642 tons, worth 2,951,058 dollars of phosphate rock which were exported to foreign countries during the first half of 1923 represented an increase of 7 per cent. in tonnage, but a decrease of 8 per cent. in value, as compared with the corresponding period in 1922. Only 113 tons, worth 8,385 dollars, of superphosphates were exported in June, 1923, while in April the shipments equalled 10,718 tons, 184,542 dollars, and the total exports for the six months were 18,742 tons, 338,965 dollars. Prepared fertiliser mixtures failed to reach the figure of 9,204 tons, 469,366 dollars, for the previous year by 398 tons, 87,102 dollars, the total exports during the first six months of 1923 having amounted to 8,806 tons, 382,264 dollars.

The Use of Compound Manures.—At the British Association meeting, now being held at Liverpool, Dr. C. Crowther, in his presidential address to the Agriculture Section on Thursday, September 13, dealt with "Science and the Agricultural Crisis." Touching very briefly on the fertiliser question, Dr. Crowther mentioned the inadequate and improper manuring still widely prevalent. A considerable part of this wastage, he said, is due to the widespread use of proprietary compound fertilisers, more often than not compounded without any special reference to the soils upon which they are to be used, or even without intelligent adaptation to the special needs of the crops for which they are supplied. It is not uncommon, indeed, to find mixtures of identical composition offered for the most diverse crops. In far too many cases also the prices charged are extravagantly disproportionate to the intrinsic value of the ingredients of the mixture, and in all these various ways costs of production are made higher than they need be. In claiming that improved manuring achieved through extended advisory guidance might effect a sensible alleviation of the present difficulties of the arable farmer, Dr. Crowther said he was not unmindful of the fact that even the best practice may result in loss when the value of produce sinks to the low levels recently touched by many crops, and the best manuring will not make it possible, for example, to grow potatoes profitably under present conditions for sale at 30s. per ton. Where loss is inevitable, however, this will usually be lowest at a level of production involving the reasonable and intelligent use of fertilisers.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Italy.

H.M. Commercial Secretary at Rome reports that a firm in Venice are open to entertain proposals from British firms for the installation of plant for the extraction of oil of maize. (Ref. D.O.T. 20,441/F.W./C.C./2.)

Netherland East Indies.

A merchant in the Netherland East Indies is desirous of obtaining the representation of a British manufacturer of a medium quality washing soap. (Ref. No. 286.)

Australia.

The Victorian Railways Commissioners are calling for tenders to be presented before October 17, 1923, for the supply of 15 tons of sodium acetate (commercial). (Ref. No. 12,039/E.D./C.P.)

Bulgaria.

The Bulgarian State Railways are desirous of receiving tenders for the supply of 500 tons of creosote to the approximate value of 3,5000,000 leva. A public adjudication of tenders will be held on September 28, 1923. (Ref. No. 11,456/F.E./C.C./2.)

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

August 27 to September 1 (inclusive).

Printing-ink. Bawtree, A. E.; and Gill, E. F. 21,644.
Reduction of Metal Oxides. Bruzac, A.; and Constant, G. 21,927.
Liquid Air or Liquid Oxygen Explosives. De Wendel et Cie, Les Petits Fils de F. 21,682.
Pitch for Briquettes. Garbe, J. B. 21,655.
Varnishes. Griffiths, M. E.; Nobel's Explosives Co., Ltd.; and Picton, N. 21,933.
Catalytic Treatment of Hydrocarbons. Hydrocarbons, Ltd.; and Porter, G. F. 22,081.
Oxygenated Organic Compounds. Johnson, J. Y. (*Badische Anilin and Soda-Fabrik*). 21,753.
Rotary Filter. Mennell, J. L. 21,811.
Metaphenylene-diamine. Pellegrini, G.; and Poma, G. 21,659.
Alphanaphthylamine. Pellegrini, G.; and Poma, G. 21,660.
Destructive Fermentation of Organic Residues. Pico, L. Boggiano-. 21,916.
White Lead. Plaueln, R.; and Rascher, M. 22,004.
Cement. Rigby, T. 22,059.
Anthraquinone Sulphonic Acids. Scottish Dyes, Ltd.; and Thomas, J. 22,029.
Fertilisers. Soc. d'Etudes Chimiques pour l'Industrie. 22,076.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. *in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.*

1922.

Recovering Liquid Solutes from Non-aqueous Solutions. Silica Gel Corporation. 5,232. **175,987**
Iron-chromium Alloys. Saltrick, W. A. 5,385. **202,664**
Reduction of Ores. Girouard, Sir E. P. C.; and Jones, F. W. S. 5,962. **202,667**
Dehydrating Process. Cheshire Kitchens, Inc. 11,131. **195,335**
Sodium Compound. Cocksedge, H. E. 11,325. **202,678**
Soap Manufacture. Weltes, A. 14,325. **202,710**
Zinc Oxide. New Jersey Zinc Company. 14,619. **180,680**
Vat Dyestuffs. Sokal, S. (*Kalle and Co. Akt.-Ges.*). 14,726. **202,734**
Condensation Products from Urea and Formaldehyde. Pollak, Dr. F. 15,218. **181,014**
Treatment of Fibres in the Application of Vat Dyes. Morton, J.; and Wood, K. R. 15,402. **202,757**
Drying Process. Rigby, T. 17,498. **202,793**
Extracting Volatile Oil from Gases. Ikeda, K.; Isobe, H.; and Okazawa, T. 17,708. **202,795**
Electrolytic Apparatus. Scott, J. P. 28,947. **202,882**

1923.

Drying Substances. Glent, K. M. 8,821. **202,925**
Thermo-electric Pyrometers. Daynes, H. A.; and Cambridge and Paul Instrument Co., Ltd. 11,216. **202,928**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Rustless Iron and Steel. Berlin, D. W. 5,705. **202,952**
Reduction of Metal Oxides with Continuous Regeneration of the Reducing-gas Employed. Constant, G.; and Bruzac, A. 19,592. **202,970**
Aromatic Sulphonic Acids. Rheinische Kampfer Fabrik Ges. 19,981. **202,975**
Producing Fast Tints on the Fibre. Soc. of Chemical Industry in Basle. 21,078. **202,984**
Durable Compounds Containing Active Oxygen. Noll, Dr. F. 21,099. **202,985**
Giving to Gases a Definite Moisture Content. Obermiller, Dr. J. 21,273. **202,993**
Continuous Analysis of Mixed Gases. Piccard, A. 21,289. **202,994**
Elevator for Liquids. Detaint, E. 21,399. **202,996**
Viscous or Resinous Products. Chemische Fabrik auf Actien vorm E. Schering. 21,412. **202,997**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Sulphur Chloride in Lead Metallurgy. E. A. Ashcroft, London. British Patent, **200,701**, of 1922.

Lead-zinc sulphide ores and the like are treated with sulphur chloride at temperatures much below 500° C. such as 50-150° C. or even 250° C. so as to chlorinate the lead and silver selectively, the bulk of the zinc sulphide being unchanged. The sulphur chloride after the chlorination of the ore contains dissolved sulphur derived from the ore and from the sulphur chloride, and sulphur may be crystallised from it. The residue after the separation of the sulphur chloride consists of gangue, unchanged zinc sulphide, and chlorides of lead and silver. The chlorides are removed by washing with hot zinc-chloride solution, or lead chloride may be removed by hot water. Or the residues may be treated with fused zinc chloride with or without an alkali chloride to dissolve the chlorides and the solution is then electrolysed.

Electrolytic Diaphragms. R. Pechkranz, Geneva. British Patent, **200,584**, of 1922.

In water-decomposing apparatus of the filter press type, thin sheet metal electrodes are arranged between frames carrying partitions of metal as thin as paper and perforated with holes as fine as a hair, a small part of the partitions at the upper parts being left solid. The partitions may be of nickel or a metal belonging to the nickel group. The electrodes may project beyond the frames for the purpose of cooling the electrolyte. The frames are of insulating material such as pressed asbestos cement. They are supported by lugs on a frame and are each provided with a groove in which a compressible material such as rubber is laid as packing for the electrodes. The frames are provided with coacting apertures, forming passages for the gases and electrolyte.

Tanning Materials. W. Moeller, Hamburg, Germany. British Patent, **200,262**, of 1922.

The injurious effect of free acid in vegetable, mineral, or synthetic tanning agents is eliminated by means of ammonia or an organic base, which serves to neutralise the acid, or by means of an ammonium salt, which retards the hydrolysing action of the acid on the hide substance. The treatment may be applied directly to the tanning agents or to hides tanned therewith. Suitable organic bases are the amines or amino-acids, which may be employed in an impure condition as occurring, for example, in the crude mixture of pyridine and quinoline bases obtained in the purification of coal tar, or in the mixture of amino-acids resulting from the hydrolysis of proteid materials. In treating tanning agents, the agent and the determined quantity of base required for neutralisation are heated together at 80–100° C. In the case of tanning agents containing free sulphonic-acid groups, the process results in an enlargement of the tanstuff molecule, and it is stated that the added base takes part in the tanning action of the final product. Examples are given describing the treatment of synthetic tanning agents of known type with aniline oil, crude pyridine bases, glycine, and with pyridine under pressure; the treatment of sulphited quebracho extract with naphthylamine and with the hydrolysis products of gelatine; the production of a tanning solution by hydrolysing glue with phenol, condensing the product with formaldehyde, sulphonating, and finally neutralising with an organic base; and the treatment of leather with quinoline bases, glycine, and a crude mixture of amino-acids. Reference has been directed by the Comptroller to Specifications 131,772, 157,855, and 175,362.

Cellulose Acetates. J. O. Zdanowich, London. British Patent, **200,186**, of 1922.

Solutions obtained in the acetylation of cellulose and suitable for spinning directly into artificial silk, etc., or for making films, are rendered stable against changes in viscosity by the addition of an aqueous solution of formaldehyde or other aldehyde, or by the addition of tetrachlorethane. In the preferred process, 150grms. of cellulose are mixed with 900 c.c. of glacial acetic acid, 420 c.c. of acetic anhydride, chlorine being passed in until the cellulose disintegrates, whereupon 0.75grms. to 1.5grms. of sulphuric acid are added and the reaction continued until solution occurs; to the solution 100 c.c. of commercial formaldehyde solution are added. Filaments, films, etc., are manufactured from this solution by direct extrusion into a suitable coagulating bath. Specifications 139,232, 190,732, and 196,641 are referred to.

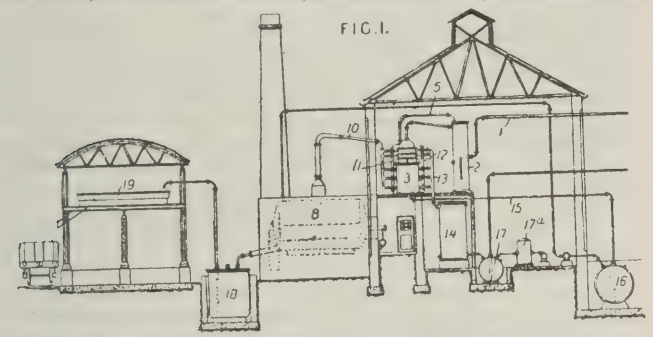
Halogenated Phenols. British Dyestuffs Corporation, Ltd., London; and H. H. Hodgson, Bradford. British Patent, **200,714**, of 1922.

m-Chlor-, *m*-brom, and *m*-iodo-phenol are prepared from the corresponding *m*-halogenated anilines by diazotising and decomposing the nitrous-acid-free diazo solution under such conditions that the *m*-halogenphenol is removed from the reaction liquid by steam distillation with such rapidity that combination with more diazo compound is prevented. In an example a cold paste of *m*-chloraniline sulphate crystals is diazotised, leaving part thereof unchanged, stirred for about two hours and filtered from the excess amine sulphate; the diazo solution is then dropped into a vessel containing boil-

ing dilute sulphuric acid, or even water, through which steam is blown to distil off the *m*-chlorphenol as it is formed. Specifications 7233/97 and 9675/04 are referred to.

Dehydrating and Distilling Tar. Coke and Gas Ovens, Ltd., London. (G. Still, Westphalia, Germany.) British Patent, **200,651**, of 1922.

Apparatus for dehydrating and distilling tar comprises a dehydrator so arranged that it may be used either for dehydration only or for pre-heating the tar flowing to a still, the apparatus being heated either by the heavy vapours of subsequent distillation of the tar or by steam. Crude tar is fed by a pipe 1 to a condenser 2 where it is preheated before entering the dehydrator 3 by the oil and water vapours leaving the dehydrator by a pipe 5. The tar gravitates through vertical tubes 6 and over horizontal coils 7, and these tubes and coils may be heated either by oil vapours leaving the still 8 by a pipe 10 or by steam from a pipe 11, each coil and the casing surrounding each nest being connected by a separate branch union both to the pipe 10 and to the steam supply pipe 11, so that each coil and tube nest may be heated either by steam or oil vapours selectively



and independently of the other nests and coils. An exhaust steam pipe 12 is provided and a pipe 13 for conveying the vapours to a condenser 14 discharging into a receiver 17 connected to a vacuum pump 17a whereby the distilling operation is carried out in a vacuum. The tar passes by gravity through a pipe 15 to a collector 16 from which it is pumped to the still 8. The pitch from the still 8 is run into a receiver 18 and transferred to pitch bays 19 arranged in the manner described in Specification 200,460.

Tar-wells. W. Allen, London. British Patent, **200,416**, of 1922.

The internal surface of the bottom of a tar-well is inclined towards the centre by increasing gradually the thickness from the centre outwards to the periphery, so that a minimum amount of liquid may be left in the apparatus when the liquor is pumped out through a vertical centrally disposed pipe. The external surface of the bottom is flat and rests on the ground, while a flat is preferably formed on the internal surface below the pipe.

Handling Pitch. Coke and Gas Ovens, Ltd., London. (C. Still, Westphalia, Germany.) British Patent, **200,460**, of 1922.

Pitch from a tar still passes to a sunken receiver from which it is forced by compressed air to raised pitch bays, so that when the pitch is solidified it may be shovelled down to a truck. The pitch bays may have flexible walls connected at their upper edges by chains with a turnbuckle arrangement, these chains being tensioned when the molten pitch is admitted but released when the pitch has solidified, so that the walls will return to their normal positions leaving gaps into which the breaking up tools can be inserted.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Organic Acid Chlorides. Farbwerke vorm. Meister, Lucius and Brüning, Hoechst-on-Main, Germany. British Patent, **200,511**. Convention date, July 6, 1922.

Carboxylic acid chlorides are produced by treating a free carboxylic acid with a sulphochloride in the presence of a solid diluent, which may comprise an inorganic salt such as alkali chloride, neutral sulphate, and pyrosulphate, or a dry powdered indifferent body, such as kaolin and sand. Preferably at least two molecular proportions of the sulphochloride, which includes alkali chlorosulphonates and aryl sulphochlorides, are used for each molecular proportion of the carboxylic acid. According to the examples: (1) one molecular proportion of glacial acetic acid is slowly added with continued stirring to a heated mixture of two molecular proportions each of sodium chlorosulphonate and sodium chloride; acetyl chloride distils off and is collected in a series of condensers. (2) two molecular proportions of both *p*-toluenesulphochloride and common salt are heated together, and one molecular proportion of glacial acetic acid is added with continual stirring; acetyl chloride distils off and is collected; the residue contains *p*-toluenesulphonic acid anhydride; benzenesulphochloride may replace the *p*-toluenesulphochloride. In the examples, potassium salts may replace the sodium salts, and by using chloroacetic acid, propionic acid or butyric acid in place of the acetic acid, chloroacetyl chloride, propionyl chloride and butyryl chloride are obtained. Specification 24255/02 is referred to.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. WEDNESDAY.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals. — One or two products have again declined in value, but the market is generally fairly steady. Business, although still rather limited in bulk, has been a little better this week. **Acetic Acid,** 80% technical, £47.; 80% pure, £51.; 98% glacial, £60. in casks and £73. in glass demijohns, ex wharf London; the spot position is fully maintained, with supplies limited; inquiry is well sustained. **Acetone,** British Government specification, £125. to £127. per ton, in drums; little is available on spot, and the general outlook is for still higher values in the future. **Alum,** lump, in casks, £10. per ton; dealers are offering Continental material at about this price, with business slow and small. **Arsenic,** Cornish white powdered, about £70. per ton, spot; offers of foreign material are coming to hand at lower prices. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; practically no inquiry about; dealers' prices are easy as quoted. **Barium Chloride,** 98—100%, about £15. per ton; the market is still on the slow side; dealers' prices are unaltered. **Bleaching Powder,** 35—37%, about £10. per ton; importers are quoting Continental material at about this figure, with the demand poor. **Borax,** commercial, granulated £24. 10s., crystals £25., powdered £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to station in Great Britain; British makers' prices are unchanged at these levels. Dealers are quoting under similar conditions as to packing and delivery at: Commercial, granulated £23. 10s., powdered £25. per ton, for home trade only. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers are offering for home trade only at these rates, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid in Great Britain; British makers are quoting for home trade only at these rates; dealers are offering some grades at competitive rates. **Cream of Tartar,** 99—100%, about 88s. to 90s. per cwt., less 2½%, for one-ton lots; at these prices, which were reduced last week, the market seems fairly steady, and some fair business has been done. **Citric Acid,** B.P., about 1s. 6d. per lb., less 5%; spot material is being freely offered at under this market quotation, but there is very little being taken up. **Epsom Salts,**

commercial quality, about £5. per ton, in bags; dealers find business very slow and small. **Formaldehyde,** 40%, on spot nominal at £95. per ton; forward, about £75. per ton; a fair inquiry is being received for material to arrive. **Glauber's Salt,** commercial quality, £3. 15s. to £4. per ton, in bags; spot offers at these rates are slow in being taken up. **Lead Acetate,** brown, about £40. to £41.; white, about £42. per ton; little business has been done; the market is rather weak. **Litharge,** about £35. 10s. to £36. per ton; dealers in imported material are doing a little business at these levels. **Lithopone,** 30% Continental red seal, £22. 10s. to £23. per ton; the demand has been fair, and prices as quoted seem very steady. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; supplies are offering on spot, but are rather slow in moving off. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers quoting at these rates. **Oxalic Acid,** about 6d. per lb.; there has been no improvement in inquiry; values as quoted seem just a little weak. **Carbonate of Potash,** 90—92%, about £26. 10s. to £27.; 96—98%, £30. to £31. per ton; the tone on the spot seems steady, but business is not at all brisk. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; there is very little business doing with dealers. **Caustic Potash,** 88—92%, on spot, about £30. per ton, in drums; dealers are quoting at about this figure, and some limited business has been done. **Permanganate of Potash,** commercial quality, about 9½d. per lb.; some few inquiries are on the market, with quoted rates unchanged. **Prussiate of Potash,** yellow, about 1s. per lb.; a further drop in values is recorded here, with business still far from good. **Sulphate of Potash,** 90%, £11. 10s. per ton, ex ship; there is no change. **Mercury,** about £9. per bottle of 75—76lb.; this market remains rather quiet, and the tone is not at all steady. **Red Lead,** imported, about £35. 10s. to £36. per ton; importers offer at about these levels, with occasional business coming to hand. **Salammoniac,** dog-tooth crystals, £48. 10s. to £49.; medium, £43. to £44.; fine white crystals, £25. to £26. per ton; stocks are offering on spot, with business rather slow and limited; prices seem quite steady. **Saltcake,** ground and unground, home trade, about £4.; export, about £5. 5s. per ton, f.o.b.; inquiry is good, with prices very steady. **Acetate of Soda,** about £24. 10s. to £25. per ton; a fair business has been done here, with prices steady. **Soda Ash,** 58% light alkali, £7. 12s. 6d. per ton, in bags; British makers quoting at this rate, for home trade only, packages free, carriage paid in Great Britain; their prices for export vary as to destination. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers are quoting at these prices, with not much business about. British makers' prices, for home trade only, on contract, are: 70—72%, £16. 17s. 6d.; 76—77%, £18. 7s. 6d. per ton, in drums, carriage paid to destination; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers offering for home trade only at this price, carriage paid to destination. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers' prices are unchanged, with business quiet. **Cyanide of Soda,** 98—100%, export, 8½d. to 9d. per lb.; British makers' prices are unchanged on the week. **Hyposulphite of Soda,** pea crystals, about £13. 10s. per ton, in 1cwt. kegs; commercial quality, about £8. 10s. to £9. per ton, in casks; dealers are offering at these slightly easier prices, with business rather limited. **Nitrate of Soda,** 96%, about £13. 7s. 6d. per ton, f.o.r. or f.o.b.; the market is rather easy at this rate. **Nitrite of Soda,** 100%, £26. 10s. per ton; the firm tone reported last week is well maintained. **Prussiate of Soda,** about 6d. per lb.; dealers find business very slow and small, and their quoted prices recently reduced are still rather weak. **Sodium Sulphide,** 60—62%, solid, about £14.; ditto, broken, about £15. 5s. per ton, in drums; 60—65% concentrated, about £15. per ton, in casks, some few small inquiries have been dealt with this week. **Sulphate of Copper,** £26. per ton; British makers continue to quote at about this figure for home and export, but Continental prices appear to be lower. **Tin Crystals,** 1s. 4d. per lb.; the market shows no change on the week. **Tartaric Acid,** B.P., crystals, about 1s. 2d. per lb., less 5%; business has again been poor this week, and the quoted price is by no means steady. **White Lead,** imported, about £42. to £43. per ton; prices are a shade easier this week, with little doing. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers' prices are returned at these unchanged values.

Pharmaceutical Chemicals.—There has been a little more inquiry on the market, and business, although confined to small lots, has been fairly good. Prices are keeping steady. **Acetanilid,** crystals and powder, 1s. 6d. to 1s. 7d. per lb.; at these slightly better rates the market keeps very steady. **Acetyl-Salicylic Acid,** B.P., about 3s. 1d. per lb.; spot supplies of good brands are quoted steadily at this improved rate. **Benzoic Acid,** B.P., 2s. 3d. to 2s. 6d. per lb.; dealers are offering at these prices, with inquiry very small. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per lb.; prices for spot supplies are steady on a quiet market. **Salicylic Acid,** B.P., about 2s. 2d. to 2s. 3d. per lb.; the market is now very steady, and fairly active at these lower levels. **Tannic Acid,** leviss, 3s. 3d. per lb.; some occasional inquiry, with market steady. **Amidopyrin,** about 14s. 6d. per lb.; there has been little doing here, and quoted rates are unaltered. **Ammonium Bromide,** about 7d. to 7½d. per lb.; the demand for supplies offering is limited; values a little steadier. **Benzonaphthol,** about 5s. per lb.; this market has been inactive. **Betanaphthol,** resublimed, about 1s. 10d. per lb.; a quiet tone continues here, with values as quoted easy. **Benzaldehyde 03,** about 3s. per lb.; slightly less is mentioned for quantities. **Calcium Lactate,** about 1s. 9d. per lb.; 1s. 9d. to 1s. 10d. per lb.; these values are well sustained, with fair business about. **Chloral Hydrate,** duty paid, about 4s. per lb.; spot supplies are fairly steady at this level. **Creosote, B.P.,** about 2s. 6d. per lb.; the market has been quiet, but prices quoted are well maintained. **Creosote Carbonate,** about 8s 6d. per lb.; this market is firmer, with a tendency to advance. **Guaiacol Carbonate,** about 8s. 3d. per lb.; the market has been idle, with quoted values unchanged. **Hexamine,** about 3s. 6d. to 3s. 9d. per lb.; at these slightly easier rates the market is firm, and has been fairly active. **Hydroquinone,** about 3s. 2d. to 3s. 4d. per lb.; easier prices are again quoted here, with the market still dull. **Methyl Salicylate,** 2s. 6d. to 2s. 7d. per lb.; this market is very healthy, and some fair business has been done. **Methyl Sulphonal,** about 15s. per lb.; hardly any inquiry about; quoted values unchanged. **Paraformaldehyde,** 3s. 6d. to 3s. 8d. per lb.; spot holders are quoting at these levels, but business is slow. **Paraldehyde,** 1s. 5d. to 1s. 6d. per lb.; the demand on spot has been small; quoted rates are rather easy. **Phenacetin,** 5s. 10d. to 6s. per lb.; the lower price quoted is for large quantities. **Phenazone,** 7s. 3d. to 7s. 6d. per lb.; at these rates the market keeps very steady, with limited business passing. **Phenolphthalein,** 6s. 6d. to 6s. 9d. per lb.; these high values are well maintained on spot. **Potassium Bromide,** B.P., crystals and granular, 6d. to 7d. per lb.; little change in the position can be recorded; market quiet; values unsteady. **Potassium Permanganate,** B.P., about 10d. per lb.; there has been fair demand, with quoted rates steadily maintained. **Potassium Sulphoguaiacolate,** 5s. 6d. to 6s. per lb.; there has been hardly any inquiry; values nominal. **Sodium Benzoate,** about 2s. 6d. per lb., nominal; market idle during the week. **Sodium Diethylbarbiturate,** about 18s. 6d. per lb.; the market holds up to this figure, but there is little business about. **Sodium Bromide,** B.P., crystals and granular, about 7d. to 7½d. per lb.; the spot position is unchanged on the week, with business slow and small. **Sodium Salicylate,** B.P., powder, about 2s. 6d. per lb.; crystals, about 2s. 8d. to 2s. 9d. per lb.; spot supplies are rather short, and the market is very steady. **Sulphonal,** about 14s. 6d. per lb.; market dull; prices quite steady. **Terpin Hydrate,** 1s. 9d. per lb.; business has been small, but the market keeps very steady. **Thymol,** about 15s. per lb.; dealers offering spot material at this price. **Vanillin,** 100%, 23s. 3d. to 23s. 6d. per lb.; the market has been quiet.

Coal-tar Products, Intermediates, Etc.—This market has been quiet, and in some directions prices are at easier rates. The general tone is rather unsteady. **Aniline Oil,** 9d. to 9½d. per lb., drums free; quoted rates are unchanged on the week, with the market steady. **Aniline Salt,** 9½d. to 10d. per lb., casks free; the market is quiet. **Betanaphthol,** 1s. 1d. to 1s. 2d. per gallon; there is little inquiry about; quoted values unaltered. **Benzol,** 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; the quoted price is steady, but business is very slow and limited. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; quoted prices are level on the week, with business

slow. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; this market has been dull, and is rather unsteady. **Naphtha,** about 1s. 4d. per gallon; this unchanged rate is quoted, but the tendency is towards slightly easier rates. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; a further reduction in price is recorded, with still but little movement in the market. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; with inquiry still poor, a further fall in value is recorded here. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; there is no change to record here. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; the market is quiet, but the tone keeps steady. **Creosote Oil,** about 9½d. per gallon, f.o.b.; dealers are quoting at this unchanged price, but there is little doing. **Carbolic Acid,** crystals, 1s. 2d. per lb., f.o.b.; the recovery in this market recorded last week seems to be well maintained. **Naphthalene,** about £19. to £20. per ton; the market is quiet and easier; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; tablets, £28.; candles, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; market quiet; values unchanged. **Pyridine,** 20s. per gallon; this article keeps very firm on spot, with supplies scarce. **Hexamethylene,** about 3s. 9d. per gallon; the market is fairly steady, but there is little doing at present. **Pure Methyl Alcohol,** £100. per ton, ex wharf London; dealers' prices are well maintained at about this level. **Pitch,** about 135s. per ton, East Coast; during the past week business has been very poor, but matters should liven up shortly; quoted rates are unchanged. **Sulphate of Ammonia,** home trade, 25¾%, £14. 10s. per ton, ex works.

ITALIAN CHEMICAL MARKET.

Genoa, Aug. 31.

August was, on the whole, a poor month for the Italian chemical market. The continual variations in the foreign exchange rendered importation very difficult. The demand for sulphate of copper improved but little, in spite of the prevalence of disease among the vines. Quotations during the month were as follows, prices being per 100kilogs. at Milan, unless otherwise stated:—**Caustic Soda,** 70—72%, Italian, 185 lire; American, 76—78%, 210 lire; English, 190 lire; French, 190 lire. **Carbonate of Soda,** 98—100%, Italian, rose from 80 to 85 lire (Genoa); English, 85 lire (Genoa); American, 85 lire (Genoa); demand fairly strong. **Soda Crystals,** 50 lire; in good demand. **Alum,** crystals, 85 lire; in very fair demand. **Bicarbonate of Soda,** powder, kegs, rose from 162 to 185 lire (Genoa). **Bichromate of Soda,** 445 lire (Genoa). **Bichromate of Potash,** crystals, 590 lire. **Borax Crystals,** 99%, in kegs, fell from 425 to 400 lire. **Carbonate of Ammonia,** lump, 430 lire; powder, 370 lire; still in good demand. **Carbonate of Magnesia,** pure, 430 lire; in little request. **Chlorate of Potash,** crystals, in fair demand at 310 lire. **Acetone,** pure, 98—99%, 1,250 lire. **Glacial Acetic Acid,** 99%, low demand at 1,200 lire. **Boric Acid,** crystals, 800 lire. **Lactic Acid,** 80%, in fair request at 300 lire. **Bisulphite of Soda,** crystals, 350 lire. **Formaldehyde,** 40%, in good call at 880 lire. **Phosphate of Soda,** 160 lire; little demand. **Hyposulphite of Soda,** crystals, 120 lire. **Metabisulphite of Potash,** 400 lire. **Nitrite of Soda,** 96—98%, demand quiet at 290 lire. **Permanganate of Potash,** crystals, in little call at 800 lire. **Sulphate of Alumina,** crystals, 18%, 100 lire. **Sulphate of Zinc,** quiet at 180 lire. **Citric Acid,** crystals, in good call at 1,900 lire. **Sulphate of Iron,** slow at 50 lire. **Hydrofluoric Acid,** 50%, in limited demand at 600 lire. **Oxalic Acid,** crystals, moderate trade at 660 lire. **Tartaric Acid,** crystals, in fair call at 1,350 lire. **Chloride of Ammonia,** lump, 98—100%, in little call at 600 lire (Milan); powder, 95—96%, in good demand at 280 lire (Genoa). **Chloride of Calcium,** 75—80%, in stronger demand at 70 lire. **Bleaching Powder,** in fair call; French, 110—115%, 90 lire; electrolytic, 100 lire. **Cream of Tartar,** 98—99%, powder, steady at 930 lire. **Yellow Prussiate of Potash,** crystals, dull at 2,000 lire. **Yellow Prussiate of Soda,** crystals, 1,400 lire; better handled. **Silicate of Soda,** Italian, 38—45%, 65 lire; crystals, 85 lire; English, 140° Tw., 100 lire. **Sulphate of Soda,** crystals, 43 lire; powder fell from 70 to 65 lire. **Sulphate of Magnesia,** crystals, 50 lire. **Chloride of Magnesia,** solid, fell from 75 to 70 lire, with hardly any business. **Hydrochloric Acid,** 20—21° Bé., 25 lire. **Sulphuric Acid,** 50° Bé., 20 lire; 66° Bé., 45 lire. **Nitric Acid,** 36° Bé., 155 lire; 42° Bé., 190 lire. **Benzaldehyde,** 3,500 lire. **Tannic Acid,** 80%, 2,000 lire. **Aluminium Acetate,** quiet at 160 lire. **Lead Acetate,** brown, 560 lire; white, 570 lire. **Betanaphthol,** 2,800 lire; in good demand. **Barium Peroxide,** 1,000 lire. **Sodium Peroxide,** in brisker demand at 1,800 lire. **Red Prussiate of Potash,** not much doing at 3,150 lire. **Caustic Potash,** 88—92%, 380 lire. **Tartar Emetic,** powder, 1,200 lire. **Mineral Superphosphate** fell from 28 to 27 lire. **Bone Superphosphate,** in smaller demand, fell from 53 to 52 lire. **Basic Slag,** 16—18%, in little call at 37 lire. **Nitrate of Soda,** 15—16%, in fair demand at 142 lire. **Nitrate of Ammonia,** in little call, fell from 120 to 115 lire. **Nitrate of Lime,** 12—13%, in dull demand at 110 lire. **Sulphate of Ammonia,** 20—21%, quotations reduced from 163 to 162 lire, with limited request. **Sulphate of Copper,** 98—99%, Italian, 225 lire; foreign, 226 lire. **Chloride of Potash,** in fair demand at 78 lire. **Sulphate of Potash,** in fair request at 100 lire. **Calcium Cyanamide,** 15—16%, in low demand, fell from 105 to 98 lire. **Sulphur,** refined, in blocks, 53 lire (Catania, Sicily), 70 lire (Milan). **Sulphur,** sublimed, 70 lire (Catania, Sicily); 77 lire (Genoa). **Crude Tartar,** quotations reduced from 310 to 281 lire.

LONDON METAL MARKET.

Wednesday.

Copper: Standard brands, £63. 5s. to £63. 7s. 6d., cash; £64. to £64. 2s. 6d., three months; electrolytic, £69. to £69. 10s. **Tin:** Standard, £199 5s. to £199. 10s., cash; £200. to £200. 5s., three months; Straits, £203. 5s.; English, £200. **Lead,** soft foreign, £25. 15s., prompt; English, £27.; chemical sheet, 34s. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 15s.; hard, £27. 15s. **Antimony,** English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £8. 15s. **Bismuth,** 10s. **Platinum,** 500s. per oz. **Wolfram,** spot, 12s. 6d. to 12s. 9d. per unit, c.i.f. United Kingdom or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 90—92%, £47. 10s. per ton, delivered; Beaver brand, 90%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45.

MANCHESTER CHEMICAL MARKET.

Wednesday.

The demand for heavy chemicals generally during the past week has again shown signs of improvement, but buyers, meantime, are only covering for spot and near requirements, and quotations all round still show a downward tendency. Prices for alkali products are fairly steady at the recent reduction, and fair business is reported on home and export account. **Bleaching Powder,** softwoods, quiet at £11. 5s., makers' works. **Roasted Saltcake** is only in small request for home trade, but there is a fair demand from abroad, and prices are maintained. **Chlorates** and **Bichromates** are unchanged. Imported American **Sulphur,** firm at £5. 5s. on rails. The demand for **Sulphate of Copper** continues slack, and quotations nominal at £25. 10s. to £26., f.o.b. There is little or no inquiry for **Phosphate** and **Commercial Hyposulphite of Soda,** and prices are weak. Concentrated **Sodium Sulphide,** lower at £14., net, carriage paid in quantity; crystals steady at £9. per ton. **Nitrite of Soda,** in fair request at £26. 10s., ex store. White powdered **Arsenic** continues easy at £69., delivered North of England, for Cornish make. **Yellow Prussiates** continue weak—**Potash** at 1s. 1d., **Soda** 6d., per lb., carriage paid. American grey **Acetate of Lime,** firmer at £22. per ton; brown scarce and dear at £11. 10s., carriage paid. Miscible **Wood Naphtha,** 6s. 6d. per gallon. **Acetone,** £130. per ton. Values of **Acetate of Soda** and **Acetic Acid** are well maintained, but there is not much business passing meantime. **Lead Salts** have a firmer tendency; foreign white **Acetate** at £42., brown £43.; and **Lead Nitrate** £42., delivered. **Barium Chloride** unchanged at £14. 10s., on rails. **Oxalic Acid** is only moving off slowly, but price is steady at 5¾d. to 6d. per lb. **Permanganate of Potash,** easy at 9¾d. per lb.

SWANSEA MARKET REPORT.

Wednesday.

There was a steady demand for **Tinplates,** and quotations were slightly easier than the basis price of £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** in fair demand, and some business transacted at higher prices, based on £18. 12s. 6d. **Copper** fairly active, with an upward tendency; prompt £63. 17s. 6d. per ton, and three months £64. 7s. 6d. **Tin** prices were irregular, and consumers held

off the market; prompt £198. 17s. 6d. per ton, and three months £200. 2s. 6d. **Lead** very active, with early delivery demand stronger; prompt £25. 17s. 6d., and three months £25. 12s. 6d. per ton; English, £27. **Spelter** very firm, with consumers anxious to place contracts over current quarter; prompt £33. 7s. 6d., three months £33. 2s. 6d. per ton. **Zinc Sheets** in active demand at £39. 7s. 6d. per ton at makers' works. **Sulphate of Ammonia** very dull. **Nitrate of Soda,** slow at £13. 12s. 6d. per ton, in 1cwt. bags. **Bone Meal** dull; Indian, prompt, £9. 2s. 6d. **Sulphate of Copper** steady, with quiet trade at £25. 17s. 6d. per ton, less 5%. **Oxalic Acid,** better sale at 6¼d. per lb., f.o.r. **Arsenic** met with moderate inquiry, with white powdered at £68. 2s. 6d. per ton, f.o.b. **Pitch** must easier, with best grades at £6. 12s. 6d. per ton. **Sulphuric Acid** in good demand, with unchanged quotations. **Benzol** met with less demand at 1s. 4d. per gallon. **Creosote Oil,** in good demand at 9¾d. per gallon, f.o.b. **Copperas** rather slow at £2. per ton, including delivery London or equal for 4-ton lots. **Seed Oils** firmly held, with raw **Linseed,** prompt, at £2. 4s. 6d.; and boiled £2. 6s. 6d. per cwt. **Cottonseed Oil,** common edible £2. 2s. 6d., and deodorised £2. 5s. 6d. per cwt. **Coconut Oil** firm, with Ceylon at £2. 3s. 3d. **Olive Oil** quiet, but steady at £66. 7s. 6d. per ton. **Palm Oil** very firm, with a dearer tendency; Lagos, prompt, £36. 2s. 6d.; softs, £35. 12s. 6d.; mediums, £36. 15s. 6d.; hards, £36. 2s. 6d. prompt, and £36. 7s. 6d. forward. There was not so much activity in the **Coal** market, and sellers had plenty of stocks on hand, and were enabled to offer concessions for immediate buying: Best Admiralty smokeless £1. 8s. 6d., seconds £1. 7s., ordinaries £1. 6s.; Monmouthshire black vein, £1. 8s. per ton, f.o.b. **Anthracite** less active: Best large £2. 9s. 6d., seconds £1. 19s. 6d. Paris nuts, £2. 19s. 9d., all per ton, f.o.b. **Patent Fuel** quiet, with unchanged quotations. **Cokes** less active, with export qualities at £2. 2s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton at ovens.

LIVERPOOL CHEMICAL MARKET. Wednesday.

The demand for chemicals of the heavier class for use by the home trade has been very fair, the tendency appearing to be towards an improved condition. In the export branch shipments have been moderately active and steady. **Bleaching Powder** has been in fair request; for the home trade £10. 5s. to £10. 7s. 6d. per ton is quoted, and for export £11. 5s. to £11. 17s. 6d. per ton. **Chloride of Calcium** has been in quietly steady demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has been rather more in request for use in the United Kingdom, and has had a moderate shipment for export; it is £19. to £20. per ton for 76%, carriage paid, for the home trade. **Bicarbonate of Soda** has had a steady inquiry for use in the United Kingdom, and is £10. 10s. per ton, carriage paid, to home-trade users. **Soda Crystals** have been in very fair request for use in the United Kingdom, and are £5. 5s. per ton, carriage paid, for the home trade. **Nitrate of Soda** has had a limited inquiry, and is £13. 5s. to £13. 10s. per ton. **Borax** has been rather more in demand; commercial crystals are £25. per ton, and powdered £26.; higher-grade crystals are £29. per ton, powdered £30., and superfine £31. per ton. **Saltcake** has been more in demand, and is £4. 10s. to £5. per ton, for use in the United Kingdom, and £5. to £6. per ton for export. **Bichromate of Soda** has been in somewhat freer request, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has been in good request for use in the United Kingdom, and has had a rather active shipment for export; it is £7. 12s. 6d. per ton for the United Kingdom, and £8. per ton for export; price varying according to destination. **Hyposulphite of Soda** has had a moderate inquiry, and is £10. to £10. 10s. per ton, in 2cwt. bags, for commercial; and £15. to £17. per ton for crystals and photographic quality, in 1cwt. kegs, according to quantity. **Sulphide of Soda** has been but little in request; solid is £14. 10s. to £15. per ton, and crystals £8. 10s. to £9. per ton. **Chlorate of Soda** has been very quiet, and is 3d. to 3¼d. per lb. **Phosphate of Soda** has moved but slowly, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has had a limited inquiry, and is 6½d. per lb. **Yellow Prussiate of Potash** has been in fair demand, and is 1s. 1d. to 1s. 2d. per lb. **Red Prussiate** has had a small sale, and is 3s. per lb. **Carbonate of Potash** has been more inquired for, and prices are somewhat lower; they are £25. to £31. per ton, according to quality. **Nitrate of Potash** has been steadily called for, and is £30. to £32. per ton for refined. **Chlorate of Potash** has had a moderate inquiry, and is 3½d. to 4d. per lb. **Caustic Potash** has been rather more in request, and is £30. to £31. per ton. **Permanganate of Potash** has been in good demand, and is 9¾d. to 10d. per lb. **Bichromate of Potash** has been in fair request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been but little called for; first quality is £63. per ton, second quality £60., and third £57. **Sulphate of Ammonia** continues quiet for the home trade, but has had a fairly large shipment for export; it is £14. 10s. per ton for neutral of 25¾%, and £13. 7s. per ton for ordinary of 25¼%, for use in the United Kingdom. **Carbonate of Ammonia** continues to meet with a steady inquiry, and is 4d. per lb. **Muriate of Ammonia** has been but little in request, and is £32. to £33. per ton. **Magnesia** has again been in very fair demand; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has had a moderate inquiry; it is £12. per ton for home-trade uses, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been quiet, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been steadily called for; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s., and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has been in rather good demand, and is 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has again been in very fair request, and is £4. 10s. to £4. 15s. per cwt. **Boric Acid** has been in quietly steady demand; commercial crystals are £48. per ton, and powdered £51. per ton, in bags, and £2. per ton more if in casks. **Citric Acid** has had a moderate sale, and is 1s. 8d. to 1s. 8½d. per lb. **Oxalic Acid** has been but little in demand, and is 6¼d. to 6½d. per lb. **White Acetate of Lead** moved but slowly, and is £42. to £43. per ton. **Sulphate of Copper** has been very quiet for the home trade and for export; it is £25. 15s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been quiet, and is £68. to £70. per ton for white powdered.

WEST OF SCOTLAND CHEMICALS. Wednesday.

Business continues fairly steady, with a fair day-to-day demand for chemicals on home-trade account, though volume is small on account of the depression in the chemical-consuming industries. Export trade is still very quiet, with little doing beyond the fulfilment of contracts. New business is scarce, and eagerly looked for. Prices generally are steady, but citric and tartaric acids are easier. Quotations, at Glasgow, are as follows:—**Alum** quiet, and in small demand; prices steady at £12. 5s. for lump, and ground £12. per ton. **Arsenic** continues in short request, and supplies are still very scarce; the quotation is £1. lower at £73. per ton, net, on spot. **Barium Chloride** remains very quiet, despite the recent reduction to £15. per ton. **Bleaching Powder** does not show much movement, and the quotation is maintained at £11. 7s. 6d. **Boric Acid** and **Borax Crystals** are little sought for though prices have been reduced, and for the former stand at £48. per ton, and £25. per ton for the latter. **Borax,** granulated, is on offer at £24. 10s. per ton, net, in 2cwt. bags. **Calcium Chloride,** 70—75%, solid, £5. 12s. 6d. per ton. **Citric Acid** is a quieter market, with the price steady at 1s. 6¼d. per lb., less 5%. **Copper Sulphate** is but little in request at £27. per ton, less 5%, at Liverpool. **Cream of Tartar** quieter, with smaller inquiry at £4. 5s. per cwt. for 99%, at Glasgow. **Lead Acetate** is in fair request; brown rather better at £42. 10s. per ton, net; and white steady at £41. 10s. per ton, net. The market for **Magnesium Chloride** is slow, with quiet business at £3. 10s. for spot. **Oxalic Acid** is 6¼d. per lb. **Paraffin Wax** experiences a quietly steady trade at 2½d. per lb. **Potash Salts** remain generally steady, with **Bichromate** at 5¾d.; **Chlorate** in request at 4d.; and **Prussiate** rather dull at 1s. 3d.; all per lb. at Glasgow. **Salammoniac** indicates only quiet business at £60. and £57. for first and second lump respectively; crystals steady at £48. 10s. per ton. **Saltpetre** is £1. 9s. per cwt., but business is nominal at this reduced figure. **Sodium Bichromate** remains steady, with business on the basis of 4½d. per lb. **Chlorate** is quieter at 3½d., while **Prussiate** continues in steady demand at 10½d. per lb. **Bicarbonate of Soda** is in good supply at £9. 15s. per ton, in 2cwt. bags; and £11. 10s. in 1cwt. kegs. **Tartar Emetic,** 43—44%, rather easier, and inclined to be dull at 1s. 1d. per lb. **Tartaric Acid** still shows a quiet tendency at 1s. 2d. per lb., less 5%, Glasgow.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending September 8.

ACETIC ACID—
Hamburg, 24 cks.

BARYTES—
Antwerp, 100 bgs.: Bremen, 69 cks.; Hamburg, 210 crts.

CHEMICALS (*otherwise undescribed*)
Bremen, 4 cs.

CHROME ORE—
Madras, 890 t.; Karachi, qty.; Paagoumene, 2,700 t. and 75 bgs.

DISINFECTANTS (*otherwise undes.*)
Marseilles, 1 crt.

FERTILISERS (*otherwise undes.*)—
Ghent, 8,250 bgs.

GLUCOSE—
Ghent, 200 bgs.

KIESELGUHR—
Bremen, 1,494 bgs.

MAGNESIUM CHLORIDE—
Hamburg, 90 drms.

PHOSPHORIC ACID—
Bremen, 17 crbys.

PLUMBAGO—
Antwerp, 9 cs.

POTASSIUM CARBONATE—
Antwerp, 27 kgs.

POTASSIUM PERCHLORATE—
Rouen, 200 cks.

POTASSIUM SULPHATE—
Hamburg, 2,000 bgs.

SALT—
Bremen, qty.
Hamburg, 2 cs., 300 bgs.

SOAP—
Marseilles, 225 cs.

SODA—
Marseilles, 75 cs.

SODIUM BICARBONATE—
Antwerp, 20 kgs.

SODIUM HYPOSULPHITE—
Hamburg, 47 cks.

SODIUM SULPHATE—
Hamburg, 250 bgs.

TALLOW—
Buenos Aires, 4 cks.

TANNING MATERIALS—
Quebracho
Buenos Aires, 11,326 bgs.

TARTAR EMETIC—
Hamburg, 10 cks.
Rouen, 10 cs.

TARTARIC ACID—
Bremen, 10 cks.

WHITE LEAD—
Hamburg, 20 cks.

ZINC OXIDE—
Antwerp, 44 brls.

GOOLE.

Week ending September 8.

CHEMICALS (*otherwise undescribed*)
Antwerp, 3 brls.

FORMIC ACID—
Hamburg, 220 crbys.

LITHOPONE—
Rotterdam, 20 cks.

MAGNESITE—
Amsterdam, 100 bgs.

WHITE LEAD—
Antwerp, 28 brls., 60 drms.

GRANGEMOUTH.

Week ending September 8.

CALCIUM CARBIDE—
Norway, 300 bxs.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Rotterdam, 1 ck.

FERRO SILICON—
Antwerp, 68 brls.
Norway, 328 cs.

GLUE—
Rotterdam, 40 bgs.

HYDROGEN PEROXIDE—
Antwerp, 96 crbys.

LITHOPONE—
Rotterdam, 50 cks.

SALT—
Rotterdam, 50 cks.

SODIUM NITRATE—
Norway, 18 cks.

TALLOW—
Norway, 6 brls.

ZINC DUST—
Antwerp, 5 cks.

ZINC OXIDE—
Antwerp, 20 brls.
Rotterdam, 51 cks.

GRIMSBY.

Week ending September 8.

ARSENIC—
Antwerp, 4 brls.

CALCIUM CARBIDE—
Christiania, 440 drms.

CHEMICALS (*otherwise undescribed*)
Hamburg, 1 cs.

COAL TAR PRODUCTS—
Tar
Esbjerg, 1 ck.

COBALT CHLORIDE—
Kobe, 10 qrs., £87.

COBALT OXIDE—
Hong Kong, 2 c., £100.; Kobe, 1 t. 16 c., £1,803.; Yokohama, 1 c. 2 q., £73.

COPPER OXIDE—
Antwerp, 10 c., £35.

COPPER SULPHATE—
Auckland, 1 t., £27.; Beira, 5 c., £14.; Cape Town, 10 c., £13.; Kilindini, 5 c., £7.

CREAM OF TARTAR—
Auckland, 1 t., £92.; Dunedin, 1 t., £92.; Hobart, 2 t. 5 c., £208.; Launceston, 10 c., £46.

DISINFECTANTS (*otherwise undes.*)
Amsterdam, 5 c., £129.; Accra, 18 qrs., £14.; Bombay, 11 c., £26.; Cape Town, 2 t., £31.; Callao, 1 c., £11.; Colombo, 14 qrs., £38.; Durban, 1 t. 1 c., £18.; Genoa, 1 t. 2 c., £30.; Halmstad, 10 c., £24.; Las Palmas, 1 t. 2 c., £29.; Lome, 13 qrs., £10.; Montreal, 1 t. 2 c., £42.; New York, 35 t., £1,341.; Pt. Harcourt, 7 c., £21.; Pt. Swettenham, 22 qrs., £15.; Singapore, 2 t. 7 c., £61.; Sydney, 1 t. 15 c., £52.; Sekondi, 10 qrs., £14.; Singapore, 1 t. 2 c., £71.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 50 t., £7,477.
Madras, 20 t. 10 c., £3,022.

Indigo
Melbourne, 4 t. 6 c., £666.
Sydney, 5 t., £794.

Methylene Blue
Shanghai, 10 c., £266.

Unspecified
Brisbane, 10 c., 2 qrs., £125.; Bordeaux, 9 c., £94.; Durban, 1 t. 1 c., £528.; Dunedin, 1 t. 2 c., £326.; Hamburg, 5 t., £620.; Hong Kong, 7 qrs., £58.; Lyttleton, 3 c., £24.; Melbourne, 3 t. 10 c., £1,124.; Montreal, 19 c., £176.; New York, 12 c. 2 qrs., £84.; Oporto, 5 c., £82.; Rangoon, 3 c., £65.; Santos, 21 qrs., £53.; Sydney, 2 t. 4 c., £813.; Sydney, 1 c., £16.

DYESTUFFS (NATURAL)—
Cudbear
New York, 12 c., £32.

FERTILISER (NITROGENOUS)—
Charleston, S.C., 200 t., £1,500.

GLYCERINE—
Aalborg, 19 c., £66.; Cheribon, 1 t., £100.; Copenhagen, 1 t. 19 c., £140.; Cape Town, 169 t. 7 c., £8,046.; Durban, 1 t. 8 c., £88.; Helsingfors, 1 t. 9 c., £111.; Kobe, 10 t. 1 c., £705.; Rangoon, 2 c., £9.; Riga, 4 c., £20.; Yokohama, 4 t. 16 c., £353.

IODOFORM—
Degama, 38 qrs., £12. 10s.

LACTIC ACID—
East London, 1 t. 3 c., £25.

LEAD NITRATE—
Calcutta, 3 t., £123.
Melbourne, 1 t., £44.

MAGNESIA—
Bahia, 5 c., £49.

MAGNESIA (CALCINED)—
San Juan, 5 c., £44.

MAGNESIUM CARBONATE—
Boston, 50 t., £1,650.

MAGNESIUM SULPHATE—
Accra, 3 c., £7. 5s.; Cape Coast, 3 c., £4. 5s.; East London, 2 c., £3.; Grand Basa, 3 qrs., £1. 5s.; Pt. Swettenham, 4 c., £6; Sierra Leone, 16 c., £22.; Saltpond, 2 c., 2 qrs., £3. 5s.; Sinoe, 2 qrs., £1.; Winnebah, 3 c., £5. 10s.

MANGANESE DIOXIDE—
Beira, 2 t., £48.

MANGANESE OXIDE—
Madras, 17 c., £29.

PHOSPHORUS (AMORPHOUS)—
Christiania, 1 c., £12.
Trinidad, 11 qrs., £32.

PICRIC ACID—
Sydney, 1 c., £13.

POTASSIUM BICARBONATE—
Melbourne, 5 c., £14.

POTASSIUM BICHROMATE—
Alexandria, 2 t. 7 c., £121.

POTASSIUM IODIDE—
Degama, 19 lb., £20.; Grand Bassam, 9 lb., £10.; Hong Kong, 2 qrs., £50.; Maranham, 22 lb., £22.; Pt. Harcourt, 1584 lb., £159.

POTASSIUM PRUSSIATE—
New York, 1 t., £233.

SALAMMONIAC—
Calcutta, 1 t. 10 c., £83.; Madras, 1 t. 1 c., £58.; Montreal, 25 t., £755.

SALICYLIC ACID—
Antwerp, 5 t. 2 c., £844.

SALTCAKE—
Buenos Aires, 50 t., £338.
Gothenburg, 754 t., £3,770.

SHEEP DIP—
Belize, 14 qrs., £11.; Bluff Harbour, 8 t., £584.; Buenos Aires, 63 t. 6 c., £2,070.; Beira, 1 t. 14 c., £124.; Blenheim, N.Z., 1 t. 19 c., £70.; Constantinople, 14 qrs., £14.; Calcutta, 6 qrs., £24.; Durban, 7 t. 8 c., £527.; Delagoa Bay, 10 t. 4 c., £749.; Dunedin, 21 t. 12 c., £822.; Invercargill, 11 t. 1 c., £489.; Nelson, N.Z., 5 t. 5 c., £449.; Oamaru, N.Z., 7 t. 8 c., £512.; Puerto Deseado, 11 t. 9 c., £437.; Santa Cruz, 34 t., £1,312.; Timaru, 4 t. 10 c., £166.; Wellington, 20 t. 4 c., £1,384.

SODIUM HYPOSULPHITE—
Mossel Bay, 3 t. 8 c., £33.

SULPHUR CHLORIDE—
Melbourne, 13 c., £22.

SULPHURIC ACID—
Antofagasta, 14 t. 17 c., £259.; Bombay, 7 c., £13.; Buenos Aires, 4 t. 2 c., £133.; Calcutta, 8 c., £22.; Durban, 1 qr., £15.; Santos, 1 t. 1 c., £38.

TANNING MATERIALS—
Unspecified
Antwerp, 2 t. 5 c., £18.; Alexandria, 1 t., £25.; Bergen, 5 t. 15 c., £48.; Calcutta, 4 t., £193.; Christiania, 11 t. 12 c., £168.; Durban, 2 t. 10 c., £50.; Melbourne, 1 t. 4 c., £21.; Sydney, 12 t. 1 c., £265.

TARTARIC ACID—
Melbourne, 1 t., £144.; Sydney, 1 t., £136.; St. John's, N.F., 2 c., £30.

TIN OXIDE—
Adelaide, 1 t., £219.; Seville, 5 c. £62.; Sydney 10 c., £121.

TRICHLORETHYLENE—
Buenos Aires, 1 t., £50.
Rosario, 4 t. 18 c., £223.

TURPENTINE—
Shanghai, 6 c., £29.

VANILLIN—
Antwerp, 6 qrs., £139.; Auckland, 2 qrs., £59.; Melbourne, 10 c., £1,148.

WOOD PRESERVATIVE—
Auckland, 10 t. 8 c., £235.; Colombo, 8 t., £258.; Tuticorin, 7 c., £60.

ZINC CHLORIDE—
Madras, 15 c., £28.
Sydney, 1 t., £28.

ZINC OXIDE—
Auckland, 1 t., £44.

Week ending September 7.

BISMUTH (METAL)—
Boston, 4 c. 2 qrs.

CALCIUM CHLORATE—
Bombay, 37 pkgs.
Melbourne, 58 pkgs.

CAUSTIC SODA—
Acapulo, 69 drms.; Adelaide, 135 drms.; Amsterdam, 112 drms.; Alexandria, 29 drms.; Alexandretta, 79 drms.; Bahia, 150 drms.; Barbados, 13 drms.; Barcelona, 4 brls.; Beyrout, 40 drms.; Bari, 61 drms.; Bombay, 894 drms.; Bourgas, 246 drms.; Bremen, 34 drms.; Cartagena, Col., 50 drms.; Brisbane, 86 pkgs.; Calcutta, 240 drms.; Callao, 100 drms.; Cape Town, 153 drms.; Gothenburg, 50 drms.; Christiania, 160 drms.; Copenhagen, 50 drms.; Hamburg, 221 drms.; Jaffa, 53 drms.; Malacca, 9 drms.; Malmo, 10 drms.; Manzanillo, 100 drms.; Melbourne, 486 pkgs., 15 drms.; Pelotas, 90 drms.; Pto. Alegre, 752 cs.; Rangoon, 10 drms.; Rio de Janeiro, 309 drms.; Rio Grande do Sul, 17 drms.; San Antonio, Chili, 83 drms.; Santos, 15 drms.; Sekondi, 100 drms.; Shanghai, 50 jars; Singapore, 145 drms.; Sierra Leone, 20 bxs., 2 cs.; Stockholm, 7 drms.; Sydney, 26 drms.; Wellington, 90 cs.

FERRO MANGANESE—
Baltimore, 752 t.; Boston, 25 t.; Hamburg, 140 t.; Los Angeles, 100 t.; New Orleans, 75 t.; San Francisco, 50 t.; Sydney, 749 t.; Vancouver, 21 t.

FERRO TITANIUM—
Hamburg, 1 ck.

FERRO VANADIUM—
Havre, 10 drms.

GLUE, SIZE, AND GELATINE—
Bombay, 5 bgs.; Boston, 100 cs., 200 bgs., 10 brls.; Buenos Aires, 22 pkgs.; Delagoa Bay, 10 pkgs.; Kobe, 100 pkgs.; Madras, 50 pkgs.; Shanghai, 100 tins; Singapore, 1 cs.; Sydney, 160 tins, 1 cs.; Wellington, 60 bgs.

MANGANESE ORE—
Bombay, 1 t.; Cape Town, 1 t.

PLUMBAGO—
Brisbane, 2 t. 10 c. Havana, 6 cks.

SALT—
Abonema, 20 t.; Accra, 30 t.; Algoa Bay, 7 t.; Antwerp, 150 t.; Annotto Bay, 5 t.; Belize, 9 t.; Bergen, 65 t.; Brisbane, 6 t.; Calcutta, 1,201 t.; Cape Town, 5 t.; Cape Coast, 3 t.; Christiania, 227 t.; Copenhagen, 10 t.; Degama, 5 t.; Drammen, 106 t.; Durban, 61 t.; Dunedin, 17 t.; East London, 5 t.; Halifax, N.S., 331 t.; Iddo, 1,040 t.; Kingston (Ja.), 93 t.; Lagos, 75 t.; Montreal, 200 t.; Mossel Bay, 5 t.; Pt. Alexandria, 2 cylds., £16.; Benkoelen, 2 cylds., £17.; Calcutta, 30 cylds., £300.; Rotterdam, 20 cylds., £152.

AMMONIUM BROMIDE—
Melbourne, 7 cs. (pt.), £7.

AMMONIUM CARBONATE—
Adelaide, 9 c., £19.; Bangkok, 5 c., £18.; Bordeaux, 10 c., £20.; Hong Kong, 15 c., £46.; Melbourne, 2 c., £17.; Paris, 7 t. 10 c., £283.; Penang, 1 t. 16 c., £92.; Singapore, 13 c., £40.

AMMONIUM CHLORIDE—
Calcutta, 3 cs., 2 cks., £49.

AMMONIUM NITRATE—
Cape Town, 58 t., £1,320.
Oporto (F.), 19 c., £38.

AMMONIUM SULPHATE—
Hong Kong, 225 t., £3,490.; Kobe, 200 t., £3,285.; Las Palmas, 44 t., £579.; Teneriffe, 15 t., £222.; Yokohama, 100 t., £1,675.

AMMONIUM SULPHYDRATE—
Canterbury, 5 cs., £11.

ANTIMONY OXIDE—
Santos, 6 cks., £35.

ANTIMONY SULPHIDE—
Copenhagen, 4 cks., £88.; Genoa, 14 cks., £141.; Montreal, 10 cks., £99.; New York, 34 cks., £336.; Sydney, 21 cks., £362.; Rotterdam, 4 cks., £68.; Toronto, 20 cks., £180.

ARSENIC—
Cape Town (F.), 4 cs., £19.
Napier, 60 drms., £228.

BARIUM SULPHATE (BLANC FIXE)—
Havre (F.), 12 cks., £48.
Paris, 100 bgs., £155.

BARIUM SULPHIDE—
Paris, 1 cs., £8.

BISMUTH CARBONATE—
Auckland, 1 cs. (pt.), £19.; Brisbane, 1 cs. (pt.), £36.; Christchurch, 2 cs. (pt.), £18.; Dunedin, 1 cs. (pt.), £18.; Melbourne, 7 cs. (pt.), £71.; Singapore, 1 cs. (pt.), £5.; Wellington, 2 cs. (pt.), £19.

BISMUTH SALTS (*otherwise undes.*)
Calcutta, 2 cks. (pt.), £126.

BISMUTH SUBCARBONATE—
Bangkok, 2 cs., £70.

BISMUTH SUBNITRATE—
Brisbane, 1 cs. (pt.), £30.
Melbourne, 7 cs. (pt.), £11.

BISULPHITE OF LIME—
Colombo, 2 cks., £7.

BITUMEN—
Monte Video, 11 cks., £33.

BONE FERTILISER—
Channel Islands, 19 t., £158.
Fremantle, 5 c., £6.

BORAX—
Adelaide, 1 t., £100.; Antwerp, 1 t. (F.), £25.; Auckland, 5 c., £8.; Brisbane, 2 t. 10 c., £250.; Callao, 1 t., £28.; Sydney, 1 c., £6.; Valparaiso, 4 t. 19 c., £145.

BORAX GLASS—
Benkoelen, 2 t. 5 c., £165.

BORIC ACID—
Bombay, 3 c., £10.; Calcutta, 1 t. 6 c., £86.; Malta, 2 c., £7.; Matadi, 1 c., £6.

BROMIDES (*otherwise undescribed*)
Christchurch, 1 cs., £7.

CALCIUM CARBIDE—
Pt. Swettenham (F.), 4 t. 18 c., £74.

CALCIUM HYPOPHOSPHITE—
Bombay, 4 cs., £66.

CALCIUM PHOSPHATE—
Channel Islands, 21 t., £92.

CAUSTIC SODA—
Townsville, 16 c., £39.

CHROME ALUM—
Dunkirk, 5 t., £500.

CHEMICALS (*otherwise undescribed*)
Adelaide, 2 cs., £6.; Alexandria, 4 cs., £28.; Switzerland, via Antwerp, 1 cs., £55.; Ascension, 7 pkgs., £5.; Auckland, 9 cs., £38.; Barbados, 5 pkgs. SHEEP DIP—
Auckland, 5 c., £14.; Baltimore, 9 t. 4 c., £220.; Wellington, 6 t. 5 c., £305.

SILVER NITRATE—
Auckland, 1 cs. (pt.), £5.
Trinidad, 1 cs. (pt.), £5.

SODA CRYSTALS—
Cape Town, 1 t., £5.

SODIUM ACETATE—
Sydney (F.), 17 cks., £100.
Sydney, 5 t. 1 c., £118.

SODIUM ARSENATE—
Melbourne, 2 kgs., £7.

SODIUM BENZOATE—
Calcutta, 5 cs., £32.
Oporto, 1 cs., £10.

SODIUM BICARBONATE—
Bombay, 2 c., £7.; Constantinople, 2 c., £6.; East London, 4 c., £5.; Monte Video, 4 c., £12.; Nassau, 3 c., £5.; Smyrna, 10 c., £40.

SODIUM BISULPHITE—
Callao, 2 t., £30.
Pt. Swettenham, 7 t. 10 c., £150.

SODIUM BROMIDE—
Melbourne, 7 cs. (pt.), £6.

SODIUM CARBONATE—
Shanghai, 1 t., £10.

SODIUM CITRATE—
Calcutta, 4 cs., 1 cks. (pt.), £27.
Melbourne, 1 cs., £12.

SODIUM GLYCEROPHOSPHATE—
Havana, 2 cs. (pt.), £20.

SODIUM HYPOPHOSPHITE—
Bombay, 4 cs., £80.; Brussels, 2 cs., £45.; Sydney, 2 cs., £45.

SODIUM HYPOSULPHITE—
Kobe, 1 t. £18.

SODIUM IODIDE—
Brussels, 2 cs. (pt.), £22.

SODIUM PYROPHOSPHATE—
Sydney, 10 c., £23.

SODIUM SALICYLATE—
Christchurch, 2 cs. (pt.), £7.; Shanghai, 2 cs. (pt.), £26.; Singapore, 1 cs., £10.

SODIUM SALTS (*otherwise undes.*)
Calcutta, 2 cks., £35.

SODIUM SULPHATE—
Alexandria, 4 c., £10.; Barbados, 1 t. 6 c., £9.; Demerara, 1 t., £10.; Jamaica, 10 c., £5.; Trinidad, 2 t., £21.; Wellington, 10 c., £5.

SODIUM SULPHIDE—
Rotterdam, 5 t. 4 c., £73.

SODIUM SULPHITE—
Shanghai, 1 t. 8 c., £44.

SPENT OXIDE—
Amsterdam, 185 t., £429.
Hamburg, 1,003 t., £1,603.

SULPHITE OF LIME—
Boulogne, 3 kgs., £10.

SULPHUR—
Montreal, 1 c., £6.
Mossel Bay, 2 t. 5 c., £34.
Trinidad (F.), 10 c., £7.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers)	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

The price of single copies is 6d. each, postage extra.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

SMALL.

Rates upon application. Order must be accompanied by remittance (Cheque or Postal Order).

CURRENT TOPICS.

A QUESTION OF POLICY.

THE interest and concern aroused by the resignation of Professor A. G. Green from his post of Director of Research to the British Dyestuffs Corporation, and the concomitant broad question of the policy of the present directors towards research, shows little sign of diminishing. Yet there is, we think, one factor in the present dyestuffs situation, having a very important bearing upon the present position in this country, which has been almost entirely overlooked. Before the war, as is well known, Germany possessed a virtual monopoly in the dyestuffs markets of the world. This monopoly covered every class of product, from the cheapest sulphur dyestuff to the most expensive vat colour, and resulted in the general net profit being sufficiently high both to allow of undercutting an incipient competitor in any particular dyestuff, and to allocate a substantial proportion of the profit to research and developmental work. It cannot be too strongly emphasised that, from the first, German dyestuffs research was financed by profits made in manufacturing dyestuffs. It is true that, as Professor Gardner points out in a letter we publish elsewhere in this issue, in the early days of the industry, the British colour manufacturers by adopting the shortsighted policy of withdrawing practically the whole of their profits were responsible for Germany obtaining her dominant position, and it is also true that were the present British manufacturers adopting a similar policy under comparable circumstances public alarm would be fully justified. The circumstances, however, are by no means comparable. With the world's capacity for consuming dyestuffs little if anything above that of pre-war years, the world's productive capacity has increased to from two to three times its pre-war extent. This is the dominant fact of the situation. In Great Britain, America, and France, huge manufacturing plants have been erected, all making similar products—sulphur, acid, basic, direct cotton, mordant, and vat dyestuffs—and all realising the necessity, in addition to supplying their home markets, of capturing a great portion of the world's markets if their plants are to be run on an economical basis; capable of producing profits large enough to allow a considerable margin being allocated to research, and on a scale extensive enough to provide a really efficient safeguard in times of war. The result is that even were the German competition entirely eliminated, neither

the British, French, nor American works, if all three operate at only moderate efficiency, can hope to sell their bulk colours in anything approaching the quantities sold by Germany in 1913, and all being inevitably highly capitalised, a very moderate margin of profit would seem all that can safely be anticipated. The statement of the case is easier than the suggestion of the remedy, but it is obvious—again leaving Germany and Switzerland out of account—that that country which first produced most efficiently and most cheaply the greatest number of bulk colours, by which we mean such dyestuffs as, for example, indigo, the alizarin mordant dyes, sulphur blacks, methyl violet, direct cotton blacks, and the simpler acid azo wool colours, would gain a preponderating position in the general world market, leading to a greater amount of profit becoming available for research. The strategic advantage thus gained in the commoner colours would, under efficient management, be maintained with newer, more complex colours, and on this account we think the present directors of the British Dyestuffs Corporation are right in their expressed policy of concentrating, for the time being, on their bulk products. Most technical men and scientists obsessed by German pre-war activities do not give sufficient attention to these greatly altered conditions. The dyestuffs industry cannot be subsidised indefinitely, either by the shareholder or the colour user, and general Government support must be kept within reasonable proportions. By obtaining a leading position in those bulk colours in greatest demand at present, our dyestuffs industry should become self-supporting, and with the help of research work unexcelled by that of any other country in the world—predominantly progressive. Notwithstanding, however, our approval for the reasons outlined above, of the broad policy of the Board of the British Dyestuffs Corporation, we nevertheless hold fast in our opinion as to the necessity for incorporating technical men in the directorate. Expert technical advice is as essential in cutting down production costs of bulk colours as in adjudicating upon the merits of new processes and products, and a combined Board of commercial and technical men is certainly the most efficient and logical method of control of any fine-chemical manufacturing industry.

THE BRITISH ASSOCIATION.

Not for many years have we known such large audiences as were present to hear the addresses to the Chemistry Section of the British Association at Liverpool. On the occasion of the delivery of Professor Donnan's presidential address, for instance, the large lecture hall was not only crowded but considerably overcrowded, and many had to be content with the echo of the speaker's voice in the corridor outside. The same state of affairs prevailed when the joint meeting with Sections A and G was held for the purpose of discussing cohesion and molecular forces, and also during the discussion on enzymes. Whilst the attendances have been extremely satisfactory, one feels tempted to make a slight criticism in two respects. The first is to express a regret that more attention is not given in Section B to applied chemistry, and the other is that some efforts are not made to encourage better discussions of the communications that are presented. Apart from the discussions already mentioned, one's impression is that of authors hurriedly reading papers, and of the President regretting there was no time for discussion. The lack of discussion was very noticeable, although the difficulties in the way of securing speakers who can discuss any particular subject are increased by the fact that only members of the British Association are admitted to the meetings. We feel safe in suggesting that only a very small percentage of chemists trouble to pay the small fee necessary to become a member and attend the meetings. Another disadvantage of the British Association meetings generally is the absence of any official record of any of the Sectional proceedings. All this, however, must not be taken to imply that matters of the highest interest and importance from both the pure and applied side were not dealt with. Our report elsewhere, in which we have dealt with the outstanding communications and discussions, is a sufficient indication that this was so, but the feeling persists that in such an active centre of the chemical manufacturing industry as Liverpool, the opportunity was lost of introducing more communications of direct practical interest. Judged by the standard of previous years, the 1923 meeting of Section B does not suffer by comparison. Next year, as has been known for some time, the meeting of the Association is to be held in Toronto, from September 3 to 10, under the presidency of Major-General Sir David Bruce. Incidentally, it may not be generally known that the British Association Fuel Economy Committee no longer exists. No report was presented this year, and in the circumstances no good purpose is served by discussing the reasons why the Committee has gone out of existence.

THE BRITISH CELLULOSE REPORT.

The report and accounts of the British Cellulose and Chemical Manufacturing Company covering the period of twenty months ended February 28 last, show a slight though definite improvement in its affairs. Although a total loss of £492,000. is recorded during the period under review, yet when comparison is made with the year ended June 30, 1921, during which a total adverse balance of £673,000. was disclosed, indications that the Company is making progress towards a profit-making basis are evident. The Company's main misfortune has been that the overcoming of the technical difficulties of manufacture and dyeing, and the extension of production capacity to a scale commensurate with the capital of the undertaking, have synchronised with a period of acute general trade depression. The energetic sales campaign prosecuted by the directors, and the growing public appreciation of the Company's artificial silk, give every indication, however, that with restoration of normality in trade, the end of the Company's long succession of troubles will be definitely reached.

DAMP ROT IN WOODEN ROOFS.

ITS PREVENTION AND CONTROL.

By Hartland Seymour.

WHEREVER wooden roofs are adopted, an ever-present problem is the prevention of rot caused by the accumulation of moisture. This condensation comes from the fact that cracks between the planks permit the warm air from the room or workshop below to pass through and come into contact with the roof covering, which, of course, is at the temperature of the outside air. The result is condensation of moisture between the wooden roof and its covering. This type of rot is found wherever high relative humidity is the rule, for instance, in textile mills and food factories. The damage thus caused is enormous, and runs into thousands of pounds annually.

In considering the cause of decay in wood there are two general classifications of fungus, which, it is generally admitted, are almost entirely responsible. The first of these is the dry-rot type, which flourishes within a narrow range of cold to moderate temperatures, and which does not require any great amount of moisture. The second is the damp-rot type, which thrives in warmer temperatures and requires larger amounts of moisture for its development. The second group—*i.e.*, damp rot—requires either air at nearly 100 per cent. humidity or a supply of water such as condenses on cool surfaces.

Types of Damp-Rot Fungi.

There are six or seven types of fungi which attack wooden roofs, and these types flourish according to their various requirements of temperature and moisture. As a general rule, these fungi germinate and propagate at temperatures between 35° F. and 110° F., while the strongest growths occur between 75°—100° F. Some of these fungi will not grow at all if they are subject to alternate wetting and drying, since this action destroys the spores; other kinds flourish best in darkness, while others require a certain amount of light, but will perish under direct sunlight.

Some investigations carried out by Mr. Wendall S. Brown, of the American Society of Mechanical Engineers, led him to the belief that decay of a wooden plank begins usually at the top surface of the plank, especially if the first ply of paper is dry sheathing not properly wiped down. Sometimes, however, infection first obtains a foothold just above the tongue and groove or spline and progresses more rapidly in the central section of the plank lying between the two extremes of moisture.

Causes of Damp Rot in Saw-tooth Roofings.

In saw-tooth buildings, valley planks usually decay first, this being generally traceable to one or more of the following contributory causes:—

1. Since saw-tooth lighting areas usually face north, the valleys are shaded considerably by the adjacent saw-teeth, which intercept the warming effect of the direct sun rays, when the sun is at a low altitude during the heating season.

2 Heating coils are often placed solely under the glass or at some distance up the wooden back of the saw-tooth, leaving the valley portion chilled, and therefore subject to excessive condensation.

3. There is a tendency for the moisture of condensation to drain to the lowest portion of the roof.

An indication of the comparative extent to which rotting has progressed in various parts of the roof may often be obtained from the brown extractive matter deposited in rusty streaks on rafters and planks. Decay is usually greatest in planks and beams at bearings, because, owing to the additional insulating properties of the supporting members, the locus of condensation dips. Tops of roof rafters and girders rot first, usually for the same reason. Also, other conditions being equal, decay is more active in the vicinity of ventilators, conductor pipes, and similar equipment.

The quality of the wood as well as the species or variety is also a factor in longevity, and various factors in the former often tend to upset too close generalisations concerning the placement of decay. For instance, three years ago two bays of roof plank and one roof rafter in a weaving shed were replaced by entirely new but unsuitable material having a high percentage of sap wood. The plank is already more than one-half rotten, and is in a worse condition than the remainder of the roof, which is thirteen years old.

Methods of Treatment.

Regarding the matter of treatment, there sems to be no practicable means of preventing exposure to infection, or of eliminating rot-producing conditions, as far as temperature alone is concerned. For new wood roofs, antiseptic treatment such as creosoting and kyanising is possible, and other processes may be adopted for the preservation of the plank.

One creosoting manufacturer has recently introduced a priming paint, and claims that it is not penetrable by creosote, thus making possible the application of white ceiling paint without sheathing. Girders and beams may be made of steel, but if untreated timber is used the upper edges of beams may be chamfered and covered with a layer of waterproof paper. Chamfering tends to raise the locus of condensation, and the paper still further assists in keeping the tops of the beams dry.

In the case of existing roofs, the treatment must necessarily be ameliorative in character rather than preventive or curative. Here it should be remembered that the term "preservation" is meant to indicate merely the economic postponement of ultimate roof renewal, and not the effect of permanency. Briefly, the treatment consists in removing from the fungus its water supply by preventing condensation as far as is practicable. Condensation is decreased by insulating the outer roof surface, the degree of prevention depending upon the amount of insulation.

There are certain limitations inherent in this treatment which prevent the full attainment either of water-supply removal or of sterilisation. Firstly, it is impracticable on account of excessive initial expense to lay enough insulation entirely to prevent condensation within the roof plank even in moderately cold winter weather. Secondly, certain fungi are suspected of having the power, once they are well developed, of manufacturing water to a limited extent through the decomposition of the wood structure itself, provided decay is deep-seated and protected from too rapid evaporation. That is, water in its liquid state is not absolutely necessary for their maintenance.

Efficient Insulation the Best Method.

Top insulation has the effect of moving the plane or locus of condensation for any given set of atmospheric conditions nearer the outer surface of the plank than before, and, in mild weather, of eliminating it entirely. In other words, the rate of condensation is reduced, as is also its duration, resulting in checking inroads of disease already established, and also in lessening the susceptibility of timber to further infection.

Insulation should be in sufficient amount entirely to prevent condensation on the under side of the roof in the coldest weather, and, if wood, should itself be antiseptically treated. Creosoted yellow-pine boarding nailed to furring strips has been found to be an economical type of insulation. Cheap, open-grained lumber, preferably sap wood, should be used, since it readily absorbs the necessary amount of wood preservative. By laying it over furring strips, additional and especially effective and inexpensive insulation in the form of an air space is obtained. This type of insulation also adds materially to the strength of the roof plank; in fact, it may be made thick enough to support the old plank if the latter has become seriously weakened, and the importance of not interrupting production is paramount. The old plank, where dangerously decayed, would then be spiked to the new plank from below.

In order to prevent entrance into the new insulating air space of warm, humid air from the room below (and therefore condensation which would otherwise occur within the upper insulating deck and would drip upon the lower untreated plank), it is necessary to have a waterproof membrane between the old roof and the new insulation. The old roofing paper may be left intact and used for this purpose, if practicable. On one large weaving shed the new insulation was laid directly on the tar-and-gravel roof without removal of gravel, except what could be easily brushed off. If considerable structural renewal becomes necessary, however, it will generally be found advisable to remove the roofing paper entirely, and, after necessary replacements have been made, to lay down a two-ply roof over the same before applying the insulation.

An economic consideration of the question invariably shows that the additional insulation saves enough heat to help very materially in meeting fixed charges on the initial cost of installation. Further, dripping from the ceiling,

which may have been experienced previously, and is a source of considerable annoyance, will be stopped.

Rearrangement of Heating Surfaces.

Sometimes it is advisable to rearrange the heating system so as to obtain a more uniform distribution. In saw-tooth buildings a portion of the heating surface should be placed under the plank and a portion under the glass, the object being to obtain a balance (that is, as little circulation of air as possible directly under the saw-teeth), and thus maintain a uniform and somewhat higher temperature here, without, however, increasing the room temperature on the working plane. The effect is to decrease still further the rate of condensation within the old roof and the number of days of its occurrence during the year.

One saw-tooth weaving shed is now twenty-three years old, and during the past ten years considerable portions of the roof have been replaced. For humidity, during approximately the first twenty years it depended upon the admission of moist basement air through belt holes in the floor at each individual loom, the basement being traversed by a canal and containing more or less standing water. Recently mechanical humidifiers were installed with the intention of maintaining a more constant relative humidity (approximately 75 per cent.) than was before possible. The humidifier installation probably has accelerated roof decay somewhat, but on the other hand, the basement may now be properly ventilated, and the present ravages of decay in floor plank, beams, and columns prevented, or at least materially retarded.

Sixty per cent. of the roof plank was so rotted as to need renewal. Two per cent. of the 6in. by 12in. yellow-pine rafters, and 25 per cent. of the 11in. by 14in. yellow-pine rafters, were replaced for the same reason.

How a Weaving-shed Roof was Saved.

The facts in this particular instance were briefly as follows: The insulation consisted of $\frac{7}{8}$in. square, edged, creosoted yellow-pine boarding nailed on $\frac{7}{8}$in. creosoted furring pieces, resulting in a $\frac{7}{8}$in. air space between the old roof and the new boards. The timber was treated on the spot by the hot-dip process, being unloaded direct to a storage pile within 40ft. of the creosoting tank, which was of steel, 20ft. long, 7ft. wide, and 5ft. deep, and had ample capacity for 3,000ft. of timber used daily.

Boards were stuck with 6ft. pieces every six boards, and were divided into two sections for a given charge, each section fastened with a cable sling. An A-frame derrick made of two 50ft. telegraph poles was used for lifting the sections into the tank. It also served in removing batches from the tank and hoisting them to the weaving-shed roof. Heavy timbers were used to ballast the lumber being treated, and these were taken to and from the tank on a carriage moving on rollers, and were lifted from it by the derrick. A batch, after being lifted out of the hot creosote, was held over the tank and allowed to drain for three or four minutes. It was then hoisted to the roof, after which practically no more dripping occurred; the partial vacuum set up by the air and steam in the wood cells, cooling, contracting, and therefore sucking in the excess surface oil.

The creosote oil used was supplied in a tank truck placed on a siding some 300ft. from, and considerably above, the creosoting tank, thus allowing a gravity flow in the pipe line connecting the two. Make-up oil was added each time a batch was removed, except that toward the end of the creosoting process, after all the oil has been placed in the tank, the amount of timber per batch had to be gradually reduced. During treatment the oil was kept at a temperature of about 230° F. by means of high-pressure steam coils having a total heating surface of 270 sq. ft. placed in the bottom of the tank.

The use of wet or unseasoned wood was apparently not detrimental, except for the fact that a longer treatment was necessary in order to ensure thorough penetration by first boiling out the entrained water.

The creosote oil used had a specific gravity at 59° F. of at least 1.08, and gave when distilled no distillate below 392° F., not more than 1 per cent. below 410° F., and not more than 10 per cent. below 455° F. The penetration was quite thorough, the amount of oil used averaging 9.4lb. per cu. ft. for a 20-hour treatment.

Where planks were rotted at bearings, but fairly sound elsewhere, new bearing strips were spiked to each side of the rafter for necessary support.

It sounds easy for an engineer or chemist to prescribe a wholesale scrapping of a wooden roof, but the owner as a rule has economic considerations at stake which do not readily permit him to put any of his plant or buildings on the scrap heap. The only satisfactory solution of the problem is a thorough study of each individual case, which must be dealt with strictly on its merits.

PHYSICAL CHEMISTRY OF INTERFACES.*

THE REMARKABLE PROPERTIES OF SURFACE LAYERS.

In recent years a great deal of attention has been paid by chemists, physicists, and physiologists to the phenomena which occur at the surfaces or interfaces which separate different sorts of matter in bulk. During the last quarter of the nineteenth century both J. Willard Gibbs and J. J. Thomson had shown clearly, though in different ways, the peculiar nature of these interfacial or transitional layers. It was evident that things could happen in these regions which did not occur in the more homogeneous and uniform regions well inside the volume of matter in bulk. Such happenings might, if they could be investigated, reveal molecular or atomic peculiarities which would be undetectable in the jostling throng of individuals inside. A surface or surface layer represents a sort of thin cross-section which can be probed and examined much more readily than any part of the inside bulk. It is indeed only within comparatively recent years that the X-rays have provided a sufficiently fine probe for examining this bulk in the case of crystalline matter.

The living organisms of plants and animals are full of surfaces and membranes. What can happen at surfaces is therefore a matter of great importance for the science of living things. We are bound to hold as long as possible to the assumption that the physico-chemical manifestations of life can be explained in terms of the potentialities of action inherent in electrons, atoms, and molecules. The modes of action of ordered arrays and marshallings of atoms and molecules are of extreme interest, since such modes of action will constitute phenomena non-existent in a disordered multitude of the same atoms and molecules with exactly the same individual powers and potentialities.

"Special Orientation" in Surface Layers.

An essential characteristic of this ordering or arraying may consist in *special orientation*. In the chemical and physical actions occurring in a volume of liquid whose bulk is large compared with its surface, the molecules or atoms probably move towards each other with every sort of orientation, no special type being privileged or distinguished. Should, however, some special orientation be characteristic of interfaces, then it is clear that such interfaces will exhibit new phenomena due to this special sort of arraying.

Dr. W. B. Hardy has been the chief pioneer in the development of these newer theories, having been led thereto by his researches on surface tension, surface films, composite liquid surfaces, and static friction and lubrication.

Unimolecular Oil Films on Water.

This question of the orientation of molecules at the surfaces of liquids has been greatly extended in recent years by a detailed study of the extremely thin and invisible films formed by the primary spreading of oily substances on the surface of water. The late Lord Rayleigh showed many years ago that when olive oil forms one of these invisible films on water, there is no fall in surface tension until the surface concentration reaches a certain very small value. He made the highly interesting and important suggestion that this concentration marks the point where there is formed a continuous layer just one molecule thick. In the case of olive oil, he found this critical thickness to be 10^{-7} cm., and concluded that this number represented the order of magnitude of the diameter of a molecule of the oil. Increase in surface concentration beyond this point causes the surface tension to fall, until a second point is reached, after which no further fall in surface tension occurs. Lord Rayleigh assumed that at the second point a layer two molecules thick is formed. This pioneer work of Lord Rayleigh was repeated and extended by H. Devaux and A. Marcelin, who showed

* Abstract of Presidential Address by Professor F. G. Donnan to the Chemistry Section of the British Association.

the correctness of his first suggestion—namely, that the primary film consists of a *unimolecular layer*. It appears, however, that the fall in surface tension, which he ascribed to the building-up of a bimolecular layer, must be ascribed to the closer packing of the molecules of the unimolecular layer, and that the second point occurs when these molecules are packed as tightly as possible.

Langmuir reasoned that the formation of these primary unimolecular films must be due to the presence of active groups in the molecules, which are attracted inwards towards the water, and thus cause the long open chain molecules of the fatty acids to be oriented on the water surface with their long hydrocarbon axes vertical and side by side.

These regularly oriented and unimolecular surface films on water have been recently investigated in a very detailed and careful manner by N. K. Adam, who has improved the method employed by Devaux and Langmuir. His results provide an ample confirmation of the theory of unimolecular films of juxtaposed and oriented molecules. If we calculate the average distance between two carbon atoms for the four acids, we obtain the following results:—

	Distance (cms.) $\times 10^{8}$.
Myristic acid	1.6
Pentadecylic acid	1.6
Stearic acid	1.5
Behenic acid	1.5

Distance Between Carbon Atoms in Organic Compounds.

These values do not deviate much from the value for the distance between the carbon atom centres in the diamond (1.52×10^{-8} cm.). Concerning this point some very interesting results have been recently obtained in Sir William Bragg's laboratory by Dr. A. Müller. In these experiments layers of crystallised fatty acids on glass plates have been examined by an X-ray photographic method. From these results it appears that the unit cell is a long prism, the cross-section of which remains constant for the substances investigated, whilst the length of the prism increases linearly with the number of carbon atoms in the molecule. The increase in length of the unit prism per carbon atom in the molecule is found to be 2.0×10^{-8} cm. Since it appears likely that there are *two* molecules arranged along the long axis of each unit cell (prism), it would follow that the increase in the length of the molecule per carbon atom added is 1.0×10^{-8} cm. Comparing this result with the value for the distance between the carbon centres in the diamond lattice, it would appear that the carbon atoms in the long hydrocarbon chains of the higher saturated fatty acids are arranged in a zig-zag, or more probably in a spiral or helix. If this be the case, the closer packing or compression of the juxtaposed molecules in the unimolecular films, as revealed in the investigations of Devaux, Langmuir, and Adam, may be to some extent explained by the straightening out of these zig-zags, or perhaps by the "elastic compression" of the helices.

Condensation of Vapours on Liquids or Solids.

As pointed out by Langmuir, the question of the formation of unimolecular surface films can be attacked in a different manner. It is known that gases or vapours can be condensed or adsorbed by solid and liquid surfaces. The question then arises, does the formation of primary unimolecular films ever occur in such cases? Langmuir has measured the adsorption of a number of gases at low temperatures and pressures on measured surfaces of mica and glass, and has arrived at the conclusion that the maximum quantities adsorbed are always somewhat less than the amounts to be expected in a unimolecular surface layer. E. K. Carver, who has measured the adsorption of toluene vapour on known glass surfaces, has arrived at a similar conclusion. The view that the *maximum* adsorption from the gas phase cannot exceed a unimolecular layer has, however, been much criticised.

Gibbs, and later J. J. Thomson, have shown that if a dissolved substance (in relatively dilute solution) lowers the surface tension, it will concentrate at the surface. That such a phenomenon actually occurs has been qualitatively demonstrated in the experiments of D. H. Hall, J. von Zawidski, and F. B. Kenrick and C. Benson, by the analysis of foams and froths. In 1908 S. R. Milner used the same method in the case of aqueous solutions of sodium oleate, and arrived at a mean value of 1.2×10^{-10} gram. mols. excess concentration per sq. cm. of surface.

It is highly probable that the molecules which are concentrated in the surface from the state of solution in the liquid phase are not in quite the same situation as the molecules of practically insoluble substances which are placed *on* the surface. In the former case the molecules are still "dissolved," so that they will be more subject to thermal agitation and less able to form a juxtaposed unimolecular layer. They may also be "hydrated." Nevertheless, the agreement as regards order of magnitude in the values of the surface area per molecule in the two types of case is certainly very suggestive and significant.

Electrical Potential Differences in Surface Layers.

Another very interesting phenomenon relates to the surfaces of liquids and solutions—namely, the existence of an electrical potential gradient or potential difference in the surface layer. These interfacial potential differences are of great importance, and play a fundamental rôle in determining the stability or instability of many colloidal states of matter. The liquid-gas interface offers the simplest case of such interfaces, and so the investigation of the potential differences which may exist at this interface is a matter of fundamental interest.

If air be violently churned up with water, only comparatively large bubbles are produced, and these quickly rise to the surface and burst. If now a very small quantity of a substance which concentrates at the air-water interface be added, an almost milk-white "air emulsion" of small bubbles is produced, which rise to the surface and produce a relatively durable froth. These phenomena were discussed by the late Lord Rayleigh in a very interesting Royal Institution lecture on "Foam." It is clear that the diminution in interfacial tension facilitates the sub-division or dispersal of the air. The existence of the surface layer will also confer a certain amount of stability on the resultant froth, since it will give rise to forces which resist the thinning of a bubble wall. Any sudden increase in the surface will produce a momentary diminution in the concentration or "thickness" of the surface layer, and hence a rise in surface tension, which will persist until the normal thickness or concentration is readjusted by diffusion of molecules from the inside volume—a process which in very dilute solution will occupy a perceptible time. It is probable, however, that the explanation of the stability of very durable forms —as, for example, those produced by the sea at the sea coast, by beer and stout, by aqueous solutions of soap or saponin, etc.—is often more complex, and that we must seek it in the formation of very viscous or semi-rigid or gel-like membranes at the interface.

The Stability of Emulsions.

Many years ago it was shown by Gad and by Quincke that a fatty oil (such as olive oil) is very readily dispersed in the form of an emulsion by a dilute solution of caustic soda. Some experiments which I once made showed that a neutral hydrocarbon oil could be similarly emulsified in a dilute aqueous solution of alkali if one of the higher fatty acids was dissolved in it, whilst the lower fatty acids do not produce a similar action. It was shown that the action runs parallel to the lowering of interfacial tension, and must be ascribed to the formation of a soap, which lowers the interfacial tension and concentrates at the interface.

We have seen that in the case of the air-water surface there exists an electrical separation or potential difference in the surface layer, and that certain substances can produce pronounced variations, or even reversals in sign, of this electrical double layer. It becomes a matter, therefore, of great interest to inquire whether similar phenomena occur at the interface between two immiscible liquids, and, if so, to ascertain whether such electrical charges or double layers bear any relation to the "stability" of pure emulsions, or fine dispersions of one liquid in another. It is well known that those disperse or finely heterogeneous states of matter known as colloidal solutions depend in part for their stability on the existence of such electrical potential differences. We might expect, therefore, that an investigation of these emulsion systems would throw some light on the general theory of what are called "suspensoid" or "lyophobic" colloidal states. Investigations with these objects in view were carried out some years ago in my laboratory by R. Ellis and F. Powis. The method employed was to measure directly by means of a microscope the motion of minute globules (sus-

pended in water) under the influence of a known electric field.

The Critical Potential Zone.

Perhaps the most remarkable result which has emerged from these investigations is the relation between the stability of the emulsion and the potential difference of the interfacial double layer. The minute oil globules are in constant Brownian motion and must frequently collide. Why do the forces of cohesion not produce agglomeration or coalescence (coagulation or clearing of the emulsion)? We should expect that under determinate conditions a certain fraction of these collisions would give rise to coherence. Is there any other factor besides orientation of path and kinetic energy which affects the probability of coherence following an encounter? The answer to the question is that the third factor is the potential difference or electric density of the interfacial double layer. Under definite conditions there exist, therefore, what we may, speaking broadly, call a *critical potential* and a *critical potential zone*. When the P.D. is outside this zone the emulsion is comparatively very "stable." Very small concentrations of electrolytes, which, as we have seen, increase the P.D., increase this stability. As soon as the concentration of any electrolyte is sufficient to bring the P.D. into the critical zone, the stability of the emulsion undergoes a sudden and very marked decrease, and relatively rapid coagulation occurs. Here we see a very striking analogue and explanation of the phenomena observed by Joly in studying the effect of aluminium salts on the sedimentation of clays, and of the numerous examples of the so-called "irregular series" observed in the flocculation of suspensoid hydrosols by salts with polyvalent cations.

New Light on Colloidal Phenomena.

As Linder and Picton showed, when two suspensoid hydrosols, one negative and the other positive, are mixed, then, depending on the ratio, a stable hydrosol (either positive or negative) can be obtained. In continuation of this work, W. Biltz demonstrated the existence in such cases of a "zone of coagulation"—*i.e.*, a zone of concentration ratios leading to coagulation. A study of the mutual behaviour of a negative oil emulsion and the positively charged ferric oxide hydrosol provides a complete explanation of this curious phenomenon. When increasing amounts of the iron oxide hydrosol are added to the oil emulsion it is found that the interfacial P.D. falls to zero, and then reverses its sign, becoming increasingly positive—an action which is due to the adsorption of the positively charged micelles at the oil-water interface. When the P.D. is above a certain value (positive or negative) the system is stable. But within the critical zone a rapid and relatively complete mutual coagulation takes place

These studies of oil emulsions (and of the glass-water interface), by means of the micro-cataphoresis method, have thrown a great deal of light on many previously ill-understood points in the theory of colloids. If, for example, the P.D. between the particles of a suspensoid hydrosol and the aqueous fluid are not above the critical potential, coagulation will occur. But very small concentrations of certain electrolytes can raise the P.D. and stabilise the hydrosol. This is the explanation of the well-known "peptising" action. The fundamental fact is that under given conditions the rate of coagulation of the particles of an oil suspension or of a lyophobic hydrosol undergoes a relatively sudden and very great increase when the interfacial P.D. falls below a certain finite value (positive or negative).

In discussing the "stabilities" of hydrocarbon oil emulsions, it must not be forgotten that I was dealing with very dilute *suspensions* of oil in water, produced by mechanical agitation without the addition of any "emulsifier." I pointed out that in the emulsification of oils in water by means of soap, the soap lowers the interfacial tension and concentrates at the interface. When we wish to produce oil emulsions in the ordinary sense of the term we must use some such emulsifying agent, and for this purpose many substances are employed, such as soap, gum acacia, gelatine, casein, starch, etc., etc. All these substances concentrate or condense on the surfaces of the oil globules. If we may regard these surface films as very mobile from the molecular-kinetic point of view, it is clear that they will confer an increased degree of stability on the emulsion. It is probable, however, that the stability of the emulsion is in many cases due to the fact that the surface films possess a very viscous, quasi-rigid, or gel-like character, so that a more mechanical explanation is necessary.

Altering the Surface Properties of Solids.

Sir George Beilby has shown that when the surface of crystalline matter is subjected to shearing stress there is produced a surface layer of a vitreous or amorphous character—a "flowed" surface—in which the particular ordered arrangement of the molecules or atoms which is characteristic of the crystalline matter largely disappears. Working at University College, London, Dr. Travers and Mr. R. C. Ray have recently obtained a very interesting confirmation of the "Beilby Effect." The heats of solution in kilogramme calories per grm. mol.) of vitreous silica and silver sand (silica as crystalline quartz) in aqueous hydrofluoric acid were found to be 37.24 and 30.29 respectively. After grinding for fifteen hours the corresponding values were 36.95 and 32.46 respectively. If we assume that the internal energy of the amorphous phase produced by grinding is the same as that of the vitreous silica (silica glass), we can calculate from these results that about 31 per cent. of the crystalline silica has been converted by grinding into "amorphous" silica. The densities of silica glass and silver sand were found to be 2.208 and 2.638 respectively. After fifteen hours' grinding the density of the latter was lowered to 2.528. On the same assumption as before, it follows that about 26 per cent. of the quartz has been converted into the vitreous condition. The difference between the figures 31 and 26 is doubtless due to the approximate character of the assumption underlying the calculations and to experimental errors. There seems little doubt, however, about the soundness of the main conclusion—namely, that the mechanical action of shearing stress on crystalline matter is to produce a random molecular or atomic distribution in the surface layers.

General Conclusions.

This discussion, necessarily brief and limited, of certain aspects of the properties of surfaces—molecular orientation, surface concentration or adsorption, electrical or ionic polarisation—has dealt very largely with states of thermodynamic equilibrium. The chief interest of such studies has always appeared to me to lie in their possible ultimate bearing on the phenomena of life. We must remember, however, that the activities, and indeed the very existence, of a living organism depend on its continuous utilisation of an environment that is not in thermodynamic equilibrium. A living organism is a consumer and transformer of external free energy, and environmental equilibrium means non-activity and eventual death. It is probable, therefore, that along and across "living surfaces" there is a continual flux of activity. Does the very existence of these surfaces depend on some special sort of activity? Questions such as these must make us cautious as regards any premature generalisation from simple physico-chemical results. But there is encouragement if we may assume that the physico-chemical manifestations of life are functions of the same powers and potentialities of electrons, atoms, ions, and molecules that we find in what we call inanimate environments. Life would then be simply a new functional relationship of very old parameters, at all events in so far as its various physico-chemical "mechanisms" are concerned.

French Dyestuffs Production. — According to the recently-published annual report of the "Union des Producteurs et des Consommateurs pour le Développement de l'Industrie des Matieres Colorantes in France," the total French dyestuffs production in 1922 was 8,065 tons, as against 5,842 tons in 1921 and 7,356 tons in 1920. If indigo and sulphur colours are left out of account, the 1922 production shows a figure of 4,978 tons, as against 2,407 tons in 1921 and 2,508 tons in 1920. The imports of reparation dyes into France from Germany were 765 tons in 1922 as against 330 tons in 1921 and 3,200 tons in 1920. Ordinary purchases of colour from Germany in 1922 totalled only 5 tons. In 1922 France imported 935 tons of colour from Switzerland (as against 629 tons in 1921). Total imports, excluding German imports, were 1,797 tons as compared with 1,134 tons in 1921.

THE BRITISH ASSOCIATION.

PROCEEDINGS OF THE CHEMISTRY SECTION.

ON Thursday, September 13, Section A (Mathematical and Physical Science), Section B (Chemistry), and Section G (Engineering), met for a general discussion on Cohesion and Molecular Forces.

DISCUSSION ON COHESION AND MOLECULAR FORCES.

Sir William Bragg, F.R.S., who opened the discussion, said that in the early days we had been compelled to deal with forces of cohesion in the aggregate. Now it was essential to get down and know the nature and effect of cohesion as between atoms and molecules themselves. We must think of molecule acting upon molecule and building up just in the same way as a girder structure was built up. The trouble in the past had been that we had thought too much in the direction of aggregates.

Dr. W. Rosenhain, F.R.S., said that cohesion phenomena were much more strongly marked in metals than organic salts or several of the inorganic salts. The closeness with which atoms approached each other had an enormous influence upon the behaviour of metals in subsequent working, and therefore it was essential to know the conditions which permitted of the atoms bonding themselves together more closely or less closely. He put forward the suggestion that the forces applied at the crystal boundary are greater than in the crystal itself, since in the boundary, the arrangement of the atoms was more dense than in the crystals themselves. It was not surprising therefore that the diffusion of gases and solids in the case of metals took place along the crystal boundaries.

Dr. A. A. Griffith said that the branch of engineering which was most intimately concerned with the phenomena under discussion, was the science of elasticity and strength of materials. Whilst the majority of structural materials were ductile and the primary failure did not involve atomic separation but just a failure in shear, nevertheless, in the case of certain materials, such as glass, stone, and hard steel, which exhibited brittle fractures running perpendicularly to the direction of greatest tensile stress, the shearing type of failure did not occur at all. A large discrepancy apparently existed, inasmuch as the tensile strengths were only a small fraction of the molecular tenacity. The problem which awaited solution might be put in the following terms: If a metallic crystal be subjected to a shear strain, what is the greatest possible elastic strain and, in the case of greater strains, by what changes in atomic configuration and orientation does the crystal adjust itself to the new conditions? Further, what is the state of stress in the crystal after the completion of the process of adjustment? Work was being done at Farnborough which might throw light upon these problems.

Sir Oliver Lodge, F.R.S., suggested that it was rather remarkable at this time in the history of science three sections of the B.A., should be asking the question why, when one picked up one end of a stick, the other end came up also. Electrical attraction was the force which must exist, although there was also Armstrong's theory of residual chemical affinity, but it did seem to him that electrical attraction must play a part. Indeed, if the atom was constructed as Dr. Langmuir wished it to be, electrical attraction was the only force. If, on the other hand, the atom was constructed as Bohr wished it to be, then other forces must come into play. Because the electrons were revolving, there must also be magnetic force.

Professor R. W. Wood asked for an explanation of a phenomenon first discovered by the Japanese, and since confirmed by himself, that if a plate of rock salt is placed in hot water at a certain temperature, it is possible to bend it to a certain angle, whereas when placed in oil at the same temperature it would not bend. It always puzzled him to know how this happened, and there was the further phenomenon that the plate so bent was permanently bent.

THE FORMATION OF PRECIPITATES.

Professor Sven Oden followed with a paper on this subject, which he had to hurry through owing to lack of time. He said that whilst precipitation is one of the oldest known problems to the chemist, very little was known of what happens. More detailed and definite mathematical knowledge was required.

The formation of precipitates may be summarised as consisting of the following stages.—

(1) The formation of nuclei consisting of addition of ions and molecules until the more stable unit-cell is completed.

(2) The growth of these nuclei or unit-cells which takes place more rapidly.

(3) The aggregation of the prime particles to secondary aggregates is analogous to the coagulation of colloids, and may be summarised as follows:—(*a*) With decreasing charge of the particles there will come a critical point when the prime-particles will aggregate. (*b*) Passing below this charge, there will be a greater number of particles in the aggregate, the smaller the charge of the individual particles, thus tending to form aggregates of unlimited size with zero-charge of the particles. (*c*) In the reversible aggregate there is no amalgamation of the individual particles and probably no equalisation of the charge on the particles. (*d*) The time for complete formation of these aggregates is great compared with the formation of nuclei and their growth, and inversely proportional to the number of prime-particles per c.c., if the electrolytes are present in the same amount, but decreasing rapidly with increasing concentration of the electrolytes, and in most cases being less than one minute.

(4) The fourth stage consists of the formation of irreversible aggregates of the prime-particles either, (*a*) of a definite structure—*e.g.*, snowflakes, skeletons, crystallites; (*b*) spherolites; and (*c*) irregular shape, assumed under pressure or external influences.

(5) The fifth and last stage is the growing of bigger crystals at the cost of smaller ones. Conditions are not only a difference in solubility with size, but also a variation in size. The more prominent the latter the more rapidly this recrystallisation or "ripening" takes place.

THE RESIN-CONTENT OF HEVEA RUBBER.

Professor G. S. Whitby, in a paper on the subject was also compelled to give only an outline of the work he has been doing, and neither in his case nor that of Professor Sven Oden was there time for discussion, although in both instances the attendance was considerable.

The resin of raw rubber, which constitutes about 3 per cent. of the material, has been found to contain liquid unsaturated acids, a new solid fatty acid (Heveic acid), a phytosterol glucoside, a phytosterol ester, a free phytosterol, quebrachitol, and *d*-valine. The acids have a marked influence on the vulcanisation of rubber in the presence of catalysts. The introduction into the rubber of strong bases has a striking effect in increasing the rate of vulcanisation with catalysts and in enhancing the tensile strength of the product. This effect is not due merely or mainly to the elimination by neutralisation, of the retarding influence of acids, but is due largely to the dispersing action on the caoutchouc of the soaps produced. The total resin-acid-content of different samples of raw rubber varies greatly. Such variation is probably an important factor in the vulcanisation of rubber samples. The ability of the resin constituents and of certain related substances to act as emulsifying agents, and that of a wide range of organic substances to swell rubber have been studied.

THE QUANTUM THEORY IN CHEMISTRY.

On Friday, September 14, following the Presidential Address by Professor J. G. Donnan, F.R.S. (see page 332), was an important theoretical paper by Professor G. N. Lewis on "The Quantum Theory in Chemistry." We will not enter into the detailed discussion in the paper, but merely indicate the broad outlines of Professor Lewis' ideas. He stated that the quantum theory leads us to suspect, not that geometry is untrue but that it is inapplicable to the problems of physical science; that any branch of mathematics based on the idea of extension or of continuous flux leads to inadequate physical predictions. There were many facts which were forcing us towards a theory of discontinuity in natural phenomena, and we were compelled to examine these facts whether we liked them or not. There were very strong intimations that our former ideas of space—even the beautifully developed theory of relativity—will prove incompetent to deal with the strange phenomena that are brought to light by the study of the individual atom. Just what substitution must be made for the continuous space of geometry it was too early to predict, nevertheless, it seemed probable that however far-reaching might be the philosophic implications of a discontinuous space, such ideas could be incorporated without much difficulty into physics and chemistry.

In the afternoon of Friday, September 14, a paper on "The Activation of Hydrogen in Organic Compounds," was read by Miss Edith H. Usherwood.

ACTIVATION OF HYDROGEN IN ORGANIC COMPOUNDS.

As a result of recent work on heavily-substituted derivatives of ethane, the idea has become familiar that the strength of the carbon-carbon bond can be so diminished that there is a progressive tendency towards dissociation in solution into two radicles. A similar phenomenon can also be noticed in the case of carbon-halogen compounds. Thus, while the bond in methyl iodide is comparatively stable, it has been found by Walden that tertiary butyl iodide is ionised in sulphur dioxide solution. There is no doubt that a similar variation exists in the strength of the carbon-hydrogen bond, and although the weakening of the bond only proceeds in rare instances to such a degree that electrolytic dissociation occurs in solution, nevertheless Miss Usherwood endeavoured to show that such variability as does occur is one of the main factors which govern the occurrence and reversibility of a great variety of apparently unrelated organic reactions, and, furthermore, is consequent upon certain well defined structural conditions.

It was evident, the paper pointed out, that there is a remarkable parallelism between the property of organic compounds of forming metallic derivatives and capacity for tautomerism, and it was probably true to say that all substances which are capable of yielding metallic derivatives and which, in addition, contain an appropriately situated double or triple bond, are actively tautomeric under experimental conditions. Capacity for alkylation is yet another important criterion of the presence of activated hydrogen. The power of a substance to act as an addendum towards an unsaturated compound, affords yet another means of recognising hydrogen in its activated condition, for the characteristic feature of additive reactions of this type is the separation of the activated hydrogen atom from the residue to which it was previously attached.

Two main classes of compounds containing an activated hydrogen atom were considered:—(*a*) compounds in which hydrogen is attached to the electro-negative atoms of oxygen, sulphur or nitrogen; and (*b*) compounds in which hydrogen is attached to carbon. As regards (*a*) it was pointed out that hydrogen attached to oxygen, sulphur or nitrogen is always activated, although the degree of mobility depends, naturally, on the configuration of the rest of the molecule. In cases in which nitrogen is attached to two hydrogen atoms, only one of these is in the activated condition, but if this becomes replaced by the alkyl group, then the other hydrogen atom becomes activated in turn. In the case of (*b*), hydrogen attached to carbon may or may not be mobile, and it is admitted that the circumstances necessary and sufficient to secure activation are by no means simple. The usefulness of these views was illustrated by reference to certain phenomena predicted from theory and experimentally verified by the author during the past few months—*e.g.*, the formation of rings with the aid of the nitroso group; and the reversibility of the aldol reaction.

DISCUSSION ON ENZYMES.

On Monday, September 17, a discussion on enzymes was opened by Dr. E. F. Armstrong, F.R.S., who said that the study of enzyme action now resolved itself very largely into the study of surface effects, and he ventured to predict that the study of surface effects would be one of the most important tasks of the chemist during the next few years.

Recent knowledge of enzymes had taught us that they belong to the class of colloids. The reactions brought about by enzymes were largely hydrolytic—*i.e.*, they concerned active hydrolysis—if water was split off into HO-H, alternatively, they involved oxidation and reduction, which were only two phases of the same thing. In this latter case, water was split off into H_2-O, so that the study of enzyme action was virtually a study of changes of water. It used to be considered that in the opalescent liquid obtained by filtering dry ruptured yeast cells the enzyme was truly in solution, but he believed to-day the view was that we are really dealing with a colloid gel.

The next stage in the investigation of the enzyme was the manner in which enzymes act as judged from the point of view of the rate of their activity. As a matter of fact, very nearly half the experiments with regard to enzyme action did not measure the rate of activity of the enzyme at all. They measured something quite different; in many cases, the rate of accumulation of dirty impurities in the solution. In other words, it was the rate of the destruction of the enzyme and not the rate of the action of the enzyme, but it could be taken that when the conditions were ideal the rate of the action of enzymes was such that it could be expressed graphically, time against action, by a straight line.

Precautions Essential in Working with Enzymes.

Enzymes, as active catalysts, were extraordinarily sensitive to outside influences. A trace of alkali in particular, and acids to a less extent, affected very considerably their activity. It was practically essential therefore that all work on them should be carried out in hard glass beakers and flasks, and that solutions should be kept in hard glass bottles, and that pipettes and burettes should be of hard glass. Neglect of these precautions had led to many of the anomalous and complicated results to be found in the literature. If we regarded enzymes as colloids, then every possible means must be taken to keep the surface clean. If the surface were allowed to become attacked by acids or alcohols, the surface would be harmed in some way. If the surface were allowed to become smeared with albuminous matter, mucilages, etc., similar results would follow.

The Anomalous Results of Attempted Purification.

Referring again to the yeast extract, Dr. Armstrong said that the best way to make a very strong enzyme from yeast was to put some ordinary brewer's yeast in a bottle with a little toluene on the top, and place it in an incubator at 36° C., for a week or more. The result would be a dark-brown liquor which, after filtering, was a thick opalescent liquor, although a very dark solution. By the cautious addition of alcohol, this could be precipitated into a brownish whitish slime, a sort of colloidal substance which, after washing with alcohol, could be quickly redissolved in water. This gave a much cleaner solution, highly active and hydrolysing. If that process were repeated with care a dozen or more times, they would get less and less material and the activity increased. They would then find, as the purification was carried farther and farther, that the reaction with sugar grows fainter; the reaction with amino acids and protein bodies would grow fainter and, in fact, nearly all the reactions would grow fainter.

Does an Enzyme Really Exist?

The only conclusion to be drawn from work of that kind was that it was impossible to purify the enzyme because there was no such thing as an enzyme in the sense that there was, say, a molecule of cellulose. It seemed to him that it was highly improbable that there is such a thing as an enzyme and that what one really deals with is a big colloid surface, one part of which contains a certain grouping which, under the proper physical conditions, is able to act as a catalyst.

What chemists wanted to know was what particular groupings existed for each specific enzyme action. All we know at the moment is that there is some definite relation between the activity of the enzyme and the substance on which it acts. Fischer suggested the analogy of the lock and key to show how to fit an enzyme on sugar, and that idea had been in the minds of most experimenters ever since. This analogy was rather an unfortunate one from our present-day point of view because it did not correlate itself with the ideas of surface action at all.

He would now like to dwell upon the nature of the first phase of the reaction, between the substance attacked and the enzyme. There were two rival theories at the moment, but the only difference was the view in the one case that the forces were chemical, and in the other case that they were physical. It was not possible to offer proof of the formation of complexes in the case of enzymes, but it was possible to offer it in the case of other catalysts, and particularly nickel, in which case there was convincing proof that such a complex was formed. It would look as if the formation of this complex was necessary for the formation of an electro-chemical circuit where the energy was started by radiations or by the ultra-violet light, on which Professor Baly was working. If we once solved this problem, then we would have a very clear idea of the manner in which changes are brought about in the living organism.

Professor F. C. C. Baly said he thought it possible to found an explanation, on the quantum energy theory, of the supply of energy by means of a catalyst to the substance which has been catalysed, which he would call a "catalyte," for want of a better word. There was the possibility that the complex is stabilised by a definite transference of energy from one component to the other, and then such a complex could not be resolved back again into its components, until or unless the energy goes back again from one component to the other. Some experimental work which he had carried out by means of spectroscopic examination pointed to the truth of this view.

A Problem in the Chlorination of Toluol.

Professor H. E. Fierz said that in the course of work he had been carrying out at Zurich he had been astonished to find that ultra-violet rays had no effect at all in the chlorination of toluene. He had not been able to come to a conclusion with regard to this, but it would be interesting to know whether Professor Baly had ever absorbed completely the heat waves. It was quite possible that if the heat waves were taken away and there was absolutely cold ultra-violet light, there might be no reaction.

Professor Baly, in reply, said he would like to know, in the first place, whether the wave length of the light used in the ultra-violet agreed with the absorption band of toluene in the ultra-violet. Professor Fierz said it did. Professor Baly said that if the energy was absorbed at the ultra-violet absorption band of toluene, instead of one quantum being absorbed, about 25 times the quantum was absorbed, and the result of the absorption of that energy was quite different from the changes produced with one quantum. If 25 times the quantum were used, the toluene would be in such a condition that it would not react with chlorine. There was a definite condition for each particular reaction, and for each specific reaction there must be the corresponding condition. The energy might be one, two, three, four or more quanta, and this might explain the difficulty encountered by Dr. Fierz.

A paper entitled " Catalytic Actions in the System Copper, Copper-Oxide, Oxygen, and Gaseous Reducing Agent," was then read by Mr. W. G. Palmer.

THE SULPHONATION AND NITRATION OF NAPHTHALENE.

Reviewing the voluminous literature, Professor H. E. Fierz, who read a paper on this subject on Tuesday, said one felt that the data which have been published since 1819 are lacking in system, and, moreover, are often contradictory. The technical man, who had to deal with this subject, knew that our knowledge was not very deep, and that as soon as he was compelled to proceed to manufacture any of the compounds which were so well and simply described, he was at a loss how to work and how to distinguish the many isomers encountered during the technical process.

Inaccuracies in Literature on the Subject.

The most valuable work ever done on the field of the chemistry of naphthalene was certainly that by Armstrong and Wynne, who established the law that by the interaction of naphthalene and sulphuric acid there were never obtained derivatives containing sulphonic groups in ortho-para or peri-position. This law held good in every case which had been carefully examined, and statements contrary to this law had been found to be incorrect and devoid of foundation.

Armstrong and Wynne did not state clearly whether they obesrved that on treating naphthalene with fuming sulphuric acid, derivatives were obtained containing two sulphonic groups in one benzene nucleus; but his (Dr. Fierz) work led him to the belief that the substitution of naphthalene with two sulphonic groups invariably gave disulphonic acids containing an acid group in each of the two fused benzene nuclei, and never both in the same one. This fact had always been tacitly accepted, but Dr. Fierz had found that in this field it was never safe to accept anything unless it was positively proved; and although this observation seemed at the first glance of no importance, it had, nevertheless, hindered the chemist getting a clear view of a field which was of great importance in connection with synthetic dyestuffs, in particular the azo colours.

The method of investigation adopted by Dr. Fierz consisted in preparing the pure free acids by decomposing the barium salts with the calculated amount of sulphuric acid. In most cases it was found that the free sulphonic acids in the naphthalene series were most beautifully crystallised substances which were non-deliquescent, and which were contrary to the statements found in the scientific literature, very easily prepared.

The facts elucidated by Dr. Fierz can be stated shortly as follows:—

Naphthalene Monosulphonic Acids.

At temperatures below 40° C. with a quantity of sulphuric acid just sufficient to mono-sulphonate the naphthalene there is formed 96 per cent of α-acid and 4 per cent. of β-acid. The 2-acid is not to be regarded as a transformation product of the 1-acid, because by dissolving pure 1-acid in sulphuric acid at 40° C. transformation to 2-acid does not occur to any appreciable extent. At temperatures of 165° C. there is invariably obtained a mixture of 85 per cent. of 2-acid and 15 per cent. of 1-acid. This is to be regarded as an equilibrium mixture, and the proportion of 1- to 2-acid varies with the temperatures, but it is impossible to obtain pure 1-acid or pure 2-acid by simply altering the reaction conditions.

The Disulphonation of Naphthalene.

The disulphonation of naphthalene has been studied by Armstrong and Wynne, as well as by Ebert and Merz, who did not agree with regard to the quantitative aspect. It is very easy to show, however, that Armstrong and Wynne were very near the truth, although their work did not allow any control, but Dr. Fierz had found that some of their data are lacking in exactitude.

On treating pure naphthalene with sulphuric acid containing just enough anhydride (SO_3) to obtain disulphonic acids, the following isomers are reading established. At temperatures under 40° C. there is obtained a mixture containing 70 per cent. of 1.5-disulphonic acid, and about 25 per cent of 1.6- and probably a little 2.7-disulphonic acid. It is very easy to show that the amount of 1.5-disulphonic acid reaches 70 per cent., because its barium salt is practically insoluble in hot or cold water, and separates immediately on mixing the boiling solution of the sodium salts of the different isomers. This interesting barium salt contains one molecule of water of crystallisation, and not four, as Armstrong stated about 30 years ago.

At temperatures between 120° and 135° C. the 1.5-acid gradually disappears, and a new disulphonic acid makes its appearance. This new acid is the 2.7-naphthalene disulphonic acid. It is not very easy to separate the 1.6- and the 2.7-acids, because the solubility of their salts is so close. What is important to the techical chemist is the fact that not a trace of 2.6-acid can be detected.

Formation of the 2.6-Acid.

On raising the temperature to 140° C. the 2.6-acid makes its appearance, being readily identified by its barium salt, which is characterised similarly to the 1.5-salt by a surprisingly small solubility. The ease of identification of the 2.6-barium salt makes it very easy to show that a statement of Ebert and Merz found in every text-book for the past fifty years is devoid of foundation—namely, that at a temperature of 180° C. the 2.6-acid is the sole product. Personally, Dr. Fierz had not been able to find more than 30 per cent. of the 2.6-acid, but Professor André Wahl had obtained 33—35 per cent.

The 2.6-acid is further characterised by a calcium salt which loses its water of crystallisation at 100° C., changing into an anhydride which is practically insoluble. The same reaction can be effected simply by heating a solution of 2.6-acid in water in a closed vessel to about 130° C., when the anhydrous form separates quantitatively in a very pure state, the other isomers remaining in solution. This experiment shows that at a temperature of 165° C. there is always formed, in round numbers, a mixture of 24 per cent. 2.6-acid, 10 per cent. or more of 1.6-acid, and 65 per cent. or less of 2.7-acid. No other acid could be identified, and it is impossible to obtain one isomer as the sole product of the reaction. The amount of free SO_3 necessary to obtain quantitative disulphonation depends on the amount of concentrated sulphuric acid also present, and taking two parts of 100 per cent. sulphuric acid and one part of naphthalene, disulphonation proceeds quantitatively at 165° C. in the course of three hours.

Euves had shown that the 1-acid and the 2-acid are changed one into the other according to the temperature, and Dr. Fierz has found that exactly the same intramolecular change takes place in the case of the disulphonic acids. The change is observed when mixtures containing no 2.6-acid are heated above 140° C.; the reverse change is effected when mixtures containing 2.6-acid are heated at 120°.

The Trisulphonic Acids.

According to the Armstrong-Wynne rule, there can be formed three different trisulphonic acids of naphthalene, but only one of them is of great technical importance—viz., the 1.3.6-trisulphonic acid. Of the two other trisulphonic acids, both are transformed readily into the same tetra-acid —viz., the 1.3.5.7, or the 2.4.6.8-tetra-sulphonic acid.

Mono- and Dinitro-compounds.

The nitration of naphthalene gives rise to two isomers—viz., the 1- and the 2- nitronaphthalene. Unlike the acids, there is no change from one into the other, and the sole similarity between sulphonation and the nitration consists in the fact that in many cases nitration at higher temperature leads to the formation of more or less 2-isomers. The 2-nitro-compound is invariably distinguished by its greater solubility, and appears therefore in the mother liquors. As a rule, the nitro-compounds are not isolated, but are at once reduced to the corresponding amino-compounds. The best-known nitrosulphonic acids are the 1.5, the 1.8, the 1.6, the 1.4.8 and the 1.3.6.8 trisulphonic acid. But there our knowledge practically ends. Professor Fierz has been able to show that nitration never proceeds quantitatively and that as a rule 10-40 per cent. escapes nitration. The free nitrosulphonic acids are very strong acids.

Difficulties in Reduction to Amino Compounds.

The reduction of the different nitro-acids is a reaction which does not always proceed smoothly. The 1.5, 1.8, and the 1.4.8, and 1.3.6.8- amino-sulphonic acids are very readily obtained, but in other cases matters are not so simple. The yield, for instance, of the naphthylamine-disulphonic acid 1.3.8, never exceeds 43 per cent., in addition to 15 per cent. of the so-called Andresen acid (2.4.7-naphthylamine disulphonic acid). In the mother liquor there remains invariably about 42 per cent. of unknown acids which cannot be purified on a small scale. The same fact applies to the preparation of the important Cleve-acids, 1.6 and 1.7, both of which are only obtained in a very unsatisfactory yield, never exceeding 65 per cent. of the theoretical.

Dr. Fierz has investigated this particular case in detail, and has been able to show that three distinct factors determine the yield. Firstly, it is not possible to nitrate the mixture of 85 per cent. 2-acid and 15 per cent. 1-acid, quantitatively, but about 10 per cent. escapes nitration and on increasing the amount of nitric acid, dinitro-acids are formed. Secondly, the reduction of the Cleve-acids is very sensitive towards free acid; the hydroxylamine derivatives, which are formed as an intermediate product are only reduced with difficulty, readily changing at the same time to aminonaphthol-sulphonic acids which cause the rapid oxidation of the Cleve-acids obtained.

A Remarkable New Diazo Compound.

The mixture of the four different amino-naphthylamine sulphonic acids, together with the aminonaphthol and the unchanged β-acid, gives rise to a colloidal solution from which the amino-acids separate only very slowly, in spite of their great insolubility. Studying this reaction in detail, Dr. Fierz has come across a new and remarkable diazo- compound which has hitherto not been described. It was noticed that nitro-Cleve acid which had been re-crystallised several times, gave Cleve-acid of surprising purity and in yields reaching 97-100 per cent. of the theoretical. At the same time it was noted that the nitrating mixture always contained a nitro-naphthol sulphonic acid, the appearance of which could be explained. The nitration mixture on one occasion, gave all the characteristic reactions of a diazonium salt, and he had been able to show that this compound is formed from the unchanged 2- naphthalene sulphonic acid always present in the crude nitration mixture. On mixing 2-naphthalene sulphonic acid with sulphuric acid and nitrous acid– in the form of sodium nitrite—no reaction whatever takes place. Adding a trace of mercuric oxide or selenium, reaction sets in immediately. At first the solution becomes greenish and then it rapidly changes to dark brown-yellow. On diluting the mixture with ice, there is obtained a solution containing the new diazonium-salt. This reaction is new in the naphthalene series but well known in the anthraquinone series, and recalls the formation 1-diazo-4-oxyanthraquinone discovered by R. E. Schmidt. Dr. Fierz said he had been able to prepare a number of azo dyes from this compound, having shades varying from orange to blue red. Curiously enough, the other sulphonic acids seem not to give similar diazonium compounds.

Bauxite in Russia.—It is reported that large deposits of bauxite have been discovered in the province of Permsk as a result of explorations carried out under the leading of M. Tumanoff, and 160 tons are said to have already been produced. An application has now been made to the Supreme Council of National Economy for the allocation of funds to work the deposits.

BRITISH OVERSEAS CHEMICAL TRADE.

AUGUST IMPORTS AND EXPORTS.

THE Board of Trade returns, so far as they relate to the chemical trade make very gloomy reading. Compared with the previous month the import trade in chemicals has increased by over 60 per cent., while exports are lower. Imports of chemicals, drugs, dyes, etc., amounted in value to £1,315,824. in August, against £796,366. in July and £1,125,021. in August, 1922. British exports of these products were valued at £1,645,856., compared with £1,739,561. in July, £2,385,072. in June, and £1,444,643. in August, 1922. The quantity figures of imports and exports of selected products are given in the table below :—

		1923. August.	July.
IMPORTS—Increases on July Quantities.			
Barytes, ground	cwts.	46,008	39,808
Boron minerals	tons	3,561	375
Calcium carbide	cwts.	50,896	37,159
Dyeing extracts	,,	8,629	8,533
Indigo, natural	,,	70	30
Manganese ore	tons	61,844	37,296
Nickel oxide	cwts.	7,129	1,860
Petroleum, crude mineral	galls.	34,310,667	30,075,435
Phosphate of lime	tons	31,584	18,696
Rosin	cwts.	123,624	76,770
Sodium nitrate	,,	262,313	40,889
Sodium c'p'ds. (except nitrate)	,,	17,517	11,647
Sulphur	tons	10,065	715
Turpentine	cwts.	59,048	32,139
White lead	,,	11,349	8,453
Zinc oxide	tons	626	484
Decreases on July Quantities.			
Acetic acid	tons	316	752
Bleaching materials	cwts.	1,290	1,608
Borax	,,	4,150	7,450
Cream of tartar	,,	2,646	4,588
Glycerine, crude and distilled	,,	286	2,209
Gums and resins (except rosin)	,,	21,154	23,963
Mercury	lb.	93,711	114,092
Paraffin wax	cwts.	65,389	67,713
Potassium compounds (except nitrate)	,,	138,923	147,465
Potassium nitrate	,,	6,263	15,541
Pyrites, iron	tons	34,551	41,153
Tanning extracts	cwts.	57,378	85,636
Tartaric acid	,,	1,237	2,680
EXPORTS—Increases on July Quantities.			
Ammonium chloride	tons	204	176
Benzol and toluol	galls.	366,562	67,763
Bleaching powder	cwts.	12,622	6,750
Carbolic acid	,,	11,581	9,648
Disinfectants, insecticides, etc.	,,	28,976	23,634
Paraffin wax	,,	28,020	10,732
Potassium chromate and bichromate	,,	3,746	1,530
Soaps (total)	,,	113,983	90,972
Tar, coal	tons	384	358
Tar oil, creosote, etc.	galls.	2,627,301	2,029,275
Tartaric acid	cwts.	706	648
Decreases on July Quantities.			
Ammonium sulphate	tons	17,002	20,586
Barytes, ground	cwts.	427	14,167
Caustic soda	,,	110,042	111,391
Cement	tons	25,963	54,924
Copper sulphate	,,	522	1,290
Dyestuffs, coal-tar	cwts.	12,830	15,023
Glue and size	,,	7,276	10,133
Glycerine, distilled	,,	2,922	3,986
Naphtha, coal-tar	galls.	8,840	9,281
Naphthalene	,,	11,168	19,856
Pitch, coal-tar	tons	1,074	4,542
Potassium compounds (except chromate and bichromate)	cwts.	1,601	2,128
Salt (other than table)	tons	28,881	33,169
Sodium carbonate	cwts.	411,306	414,608
Sodium sulphate	,,	101,846	212,546
Sulphuric acid	,,	693	1,961
White lead	,,	7,398	15,811
Zinc oxide	tons	53	243

NATIONAL GAS EXHIBITION.

INTERESTING DISPLAY AT BIRMINGHAM.

THE National Gas Exhibition, the first to be held in the provinces, was opened at Bingley Hall, Birmingham, on Monday, and will remain open until October 3. It is of a very comprehensive character, thoroughly representative of the British gas industry, its object being to demonstrate the service of gas in home and industry. It is fitting that the exhibition should take place in the district in which Murdoch made many of his early experiments in gas lighting at Soho, Birmingham.

The great hall is filled with trade exhibits, many of technical interest having relation to the underlying principles of gas manufacture; but the exhibition, as a whole, serves to demonstrate the extent of the progress made in recent years with regard to gas-manufacturing methods and gas equipment for domestic purposes. The promoters have demonstrated how ill-founded is much of the criticism that has been directed to the gas industry in recent years; they certainly show that the industry is capable of rendering to the public the greatest possible service by the provision of light, heat and power, while at the same time conserving our coal supplies and purifying the atmosphere.

British-Sulphate-of-Ammonia-Federation Exhibit.

There are a number of stands of chemical engineering and kindred interest, and here it may be mentioned that the by-products of gas manufacture in this country annually include 10 million tons of coke and 150,000 tons of sulphate of ammonia. The wonderful effect on vegetable life of the latter is shown in the British Sulphate of Ammonia Federation's exhibit, at the main entrance, of an old-fashioned garden, together with some remarkably fine specimens of farm roots, including sugar beet.

The South Staffordshire Mond-Gas Company (Dudley) exhibit bituminous paints and varnishes, preservatives, disinfectants and sheep dip, etc., produced from the residual products of the manufacture of Mond gas.

Soap and soap powders, as well as paste for removing grime, grease and stains from the hands without injury are exhibited by Messrs. Fitchetts, Ltd., of Birmingham.

Tar products, horticultural sundries and synthite are displayed by the Midland Tar Distillers, Ltd., of Birmingham.

Messrs. Thomas and Bishop, Ltd., London, exhibit "Permac" jointing material; water, at a pressure of 250lb. per sq. in. is employed, and joints are broken and remade, the claim being made that no time is necessary for setting, and that disintegration does not take place where acids or chemicals are used.

Obviating Naphthalene Troubles.

The Shell-Mex, Ltd., London, exhibit Mexsol for dealing with naphthalene troubles. This material is a straight-run petroleum distillate, with a low final boiling point, and is now used as a naphthalene solvent, by evaporating by heat or by spraying. It is claimed, moreover, that the presence of the dissolved naphthalene in the gas improves its calorific and lighting value. Models are shown illustrating the supply and distribution of Shell gas oil as a washing, absorbing or extracting agent.

The Horstmann Gear Co., Bath, display controllers for automatic street lighting; the National Gas Engine Company, of Ashton-under-Lyne, gas engines, coupled with dynamos, for generating electric light; and a number of exhibits of industrial interest are sent by the Industrial Research Laboratories of the Birmingham Gas Department, of which Mr. C. M. Walter, D.Sc., is the engineer in charge. These include a new type of high-efficiency gas furnace, having an inside working chamber of 4ft. 6in. long by 2ft. 6in. wide by 18in. high, working with town's gas with a natural draught. It has been developed with the object of producing a heating plant of a high thermal efficiency, especially in the larger sizes having hearth areas of from 3ft. by 2ft. up to 12ft. by 5ft. The construction follows closely the lines of existing large-type producer-gas-fired furnaces, and includes a special type of counter-current regenerator applying to both gas and air supplies. A gas-heated tube furnace for the special treatment of steel components without oxidation also commands attention. The work is suspended in a tube, heated externally, through which a sealing gas is passing, burning at the top; thus all air is excluded.

Co-operative Exhibits.

A large amount of space is devoted by the British Commercial Gas Association to a comprehensive and representative display of the many branches of public service which the gas industry is able and anxious to offer to consumers. It effectively demonstrates, largely by photographs, the seriousness of the smoke evil, the latter emphasising the economy achieved by carbonising coal in gasworks and so preserving valuable by-products, samples of which are shown, including sulphate of ammonia, benzol, coke, tar, dyes, disinfectants and perfumes. A co-operative exhibit by Midland gas undertakings takes the form of a series of model rooms designed to show up-to-date gas fittings and apparatus.

By-Product Plant and Refractories.

The Chemical Engineering and Wilton's Patent Furnace Company, London, have an interesting stand which includes an open saturator for making daily one ton of sulphate; a draining table for draining sulphate fished from saturators; a change valve for operating the oxide purifiers; a small ammonia still section, together with a model of a large ammonia still; a neutral sulphate of ammonia dryer, a model plant for dehydrating tar, and a forced-draught furnace for burning coke breeze and other low-grade fuels for steam-raising purposes.

Refractory material is featured, and in this regard reference should be made to silica bricks and blocks shown by the Meltham Silica Fire Brick Company, of Huddersfield, these being peculiarly suitable for steel, glass, and gasworks, and coke-oven plants. Vertical and horizontal retorts are also shown. Retort charging machines, gas valves and producer doors and grates, as well as machine-made retorts, silica bricks and segmental retorts, are displayed by Messrs. Gibbons (Dudley) Ltd., Worcestershire; and the Consett Iron Co., Consett, Durham, show a variety of refractories. Samples are on view of raw material, together with the finished product of silica segmental retort. Messrs. Mobberley and Perry, Ltd., Stourbridge, have a number of exhibits of lumps of fireclay (part green and part burnt) showing slight shrinkage, gas retorts, fractured pieces of fire bricks revealing uniform texture, and blue bricks and fractured portions showing complete vitrification.

Scientific Control Equipment.

Scientific and gas manufacturing equipment of various kinds is arranged by Messrs. Alexander Wright and Co., of London; this includes photometrical apparatus, calorimeters, laboratory meters, apparatus for verification of such meters, equipment for determining and recording specific gravity of gases, and a carbon-monoxide recorder. Gas coal and by-products from same, together with paints for gas holders, are exhibited by the G. J. Eveson Coal and Coke Co., Ltd., Birmingham. Gas calorimeters are featured by the Sigma Instrument Co., Letchworth; they include indicating and recording instruments for use with purified or unpurified gas, and a water flow calorimeter which has easy access to the water space.

Meetings and Lectures in Connection with the Exhibition.

From October 1 to October 3 the British Commercial Gas Association will hold its conference in Birmingham. On the morning of October 2, following a civic welcome, and Alderman Lloyd's presidential address, Mr. J. R. Clynes, M.P., will speak on "Goodwill in Industry," and in the afternoon Sir Frederick Mott will preside at a conference on "Gas Service in Relation to Domestic Economy." The use of gas in industry and in catering will also be discussed, and a number of popular lectures will be given in connection with the exhibition.

The Birmingham and Midland Section of the Society of Chemical Industry and the Midland Junior Gas Association will hold a joint meeting on the evening of September 25, Dr. E. B. Maxted presiding. The following papers will be read: "Specific Heat of Coal in Relation to its Composition," by Mr. G. Coles (Mining Research Laboratory); "A New Gas-fired Combustion Furnace," by Mr. T. J. Hedley (Department of Chemistry, University of Birmingham); and "Improvements in Net Value Calorimetry (with a description of an automatic device for temperature and pressure correction)," by Mr. C. H. Beasley. Discussion will be opened by Mr. C. F. W. Rendle (President of the Midland Junior Gas Association). Mr. William A. Twine (Chemical Plant Superintendent, Birmingham Gas Department) will lecture on "Coal and What We Get from It." On Saturday, September 22, there will be a joint meeting of junior gas associations and salesmen's circles.

ITEMS OF INTEREST.

Belgian Gas-Shell Works Fatality.—Three persons have been killed and four injured in an explosion at the Liessis works, near Quevy, where old gas shells were in process of being refilled.

Soda-ash Production in Italy.—The firm of Solvay and Co. are now manufacturing sodium carbonate of 98-100 per cent. purity at their Rosignano (Pisa) factory, and are offering it for sale in the Italian market.

Pyrometer Maintenance.—In a circular, the Bowen Instrument Co., of Leeds, draw attention to the fact that they undertake tests, repairs and replacements of any make of pyrometer, and invite contracts for regular inspection and maintenance.

Change of Address.—The London offices of the Agricultural Information Bureau for the French Potash Mines have been removed to 11-12 Bury Street, St. Mary Axe, E.C. 3. Telegrams: "Sylvinite, Ald., London"; Telephone No. "Avenue 3205."

Death of Dr. Friedlandep.—The death is announced from Germany of Dr. Paul Friedländer at the age of 66. Dr. Friedländer was one of the best-known German dyestuff chemists, his monumental work, "Die Fortschritte der Teerfarbstoff-Industrie" being a universal book of reference.

Consett Coking Plant.—On Saturday, at the invitation of the Consett Iron Co., Ltd., about a hundred expert coke-oven managers and technical representatives of various concerns visited the new works. The new plant consists of 60 Wilputte ovens of the regenerative type, and they are expected to carbonise at least 6,000 tons of coal per week.

Fire.—It is reported that a fire broke out last week in the works of Messrs. Archibald H. Hamilton and Co., Ltd., oil and paint manufacturers, Glasgow. It originated in a timber and corrugated iron erection, which with its contents was damaged to the extent of £400. The firemen prevented the flames from spreading to a large quantity of petrol which was stored in the vicinity.

Removal of Chemical Works.—Messrs. Brotherton and Co., of Leeds, it is announced, are removing immediately their Workington chemical works, which deal with half the output of tar from the Cumberland collieries. Their lease of the site at Workington Dock, on which the plant was laid down ten years ago, has expired, and it is understood cannot be renewed. The decision is causing great regret locally.

Benzol-plant Fatality. — A double fatality occurred at New Brancepeth Colliery, near Durham, last week. Arthur Greenwell (35), and Frederick Underwood (31), had been sent to clean out a tank at the benzol plant. They had been engaged about an hour removing slurry from the bottom, which was about ten feet down, when they were found lying there dead, having been overcome by the poisonous gases which they had disturbed.

Wholesale Druggists' Failure.—At a meeting of creditors of W. N. Monks and Co., Ltd., 38, Silverwell Lane, Bolton, a statement of affairs presented disclosed liabilities £3,334. 1s. 8d., of which £2,730. 12s. 1d. was due to unsecured creditors, while the bank were creditors for £603. 9s. 7d. Net assets were £1,877. 10s. 7d., leaving a deficiency of £1,456. 11s. 1d. It was decided to confirm the appointment of Mr. Whittaker, of Bolton, as liquidator.

Tariff Notes.—Under the revised commercial convention between France and Czechoslovakia, which came into force on September 1, customs duties leviable on various goods have been reduced as follows:—Sulphuric acid, not fuming, 20 per cent. reduction in tariff duty; sodium chlorate, 20 per cent.; barium carbonate, nitrate and chloride, 20 per cent.; ultramarine blue, 25 per cent.; inks, 25 per cent.; refined soap, 40 per cent.; aromatic essences, 40 per cent.

Business Notices. — Keeling's Oxides (1921), Ltd., announce to the trade that they have appointed James M. Brown, 35, Surrey Street, Strand, London, W.C. 2, as sole distributor of their products Hitherto Mr. Brown has been sales controller to the company since its inception and possesses a wide and exact knowledge of the zinc oxide trade. All orders and communications should be addressed as above, and all cheques made payable James M. Brown.—By permission of the Board of Trade, the name of Hacars, Limited, soap and disinfectant manufacturers, has been changed to The Salus Company, Limited.

The Vulcanisation of Rubber.—We have received from Dr. Henry P. Stevens a brochure containing reprints (from the *Rubber Age*) of the three Cantor Lectures he delivered before the Royal Society of Arts in the spring of this year.

Low-temperature Carbonisation in Japan.—An order on behalf of the Japanese Government has been received by the Low Temperature Carbonisation Company for a smokeless fuel plant for the manufacture of "Coalite" and by-products of coal.

Activity in British Dyestuffs Shares.—A good deal of buying both of the preference and preferred ordinary shares of the B.D.C. is reported to have taken place during the week, and rumour is prevalent that some form of reconstruction of the company is probable in the near future.

New Diabetes Remedy.—It is reported that Mr. Oliver H. Newell, a biological chemist of London, has prepared an inorganic compound which he claims to be as efficient as insulin in combating diabetes. The product, which has been termed "diabetene," can be administered through the alimentary tract.

British Lead Mining. — The Weardale Lead Company, Ltd., announce that they have arranged for a lease of the Allendale lead mines, Northumberland. These mines in the past produced important quantities of lead ore, and there is considerable promise in certain workings which will be more fully developed.

Dangerous Drugs in Ships. — The Home Secretary has made a regulation, dated September 10, empowering port medical officers to issue certificates to masters of foreign ships authorising them to obtain, within certain limits, preparations containing opium, cocaine, morphine, or heroin, which are required to complete the necessary medical equipment of the ship.

New Capital Issue.—Burt, Boulton and Haywood, Ltd., is offering to shareholders registered on September 8 88,000 ordinary shares of £1. each at par, payable 5s. per share on application, on December 12, 1923, and on January 16 and March 26, 1924, respectively. The right of renunciation is given, and the allotment letter will be split once. The new shares will rank for dividend from January 1, 1924.

International Chemical Congress on Tanning Materials. —From September 17 to September 21 an international congress of chemists engaged in the tanning-materials industries has been held at Barcelona. The congress has been organised by the Spanish section of the "Chemische Gesellschaft der Gerbindustrie," and delegates were presnt from England, Belgium, Italy, Switzerland and Japan

Unlawful Possession of Cocaine. — Answering an advertisement on August 28 regarding the sale of chemicals, John Radcliff, a technical chemist, of Woodside Park Road, N., found the chemicals to be cocaine. The high price asked, £2,000. per kilo., aroused his suspicions, and he communicated with Scotland Yard. In the result, E. Landorff and A. Lundberg, Swedish merchants, were arrested and charged with unlawful possession of cocaine.

Ammoniacal Liquor for Water-softening.—In a paper read at the annual meeting of the Société Technique de l'Industrie du Gaz en France and reported in the *Gas Journal*, M. Chevalet proposes the use of ammoniacal liquor for softening feed water to boilers. He is of the opinion that the combination of ammoniacal liquor and heat presents a system of feed-water treatment which is not costly, is extremely simple of control from the chemical point of view, and enables one to use plant of far smaller dimensions than when heat alone is employed.

Compagnie Nationale des Matieres Colorantes.—At the annual general meeting of the "Compagnie Nationale des Matières Colorantes," which was held on September 6, it was stated that the number of individual dyestuffs manufactured had increased from 10 in 1920, to 600 in 1921 and to over 1,000 at the end of 1922. In total weight of products, the colours made in 1922 exceeded the 1921 figure by 125 per cent. The company has extended its plant during the year, has built extensive new laboratories at Villiers St. Paul, and has reduced its production costs. The report mentions that the sudden fall in the price of indigo in the Far East and the increasing competition in overseas markets have presented great difficulties. From a total profit of 5.92 million francs, 4.79 millions have been relegated to the amortisation account, 56,842 francs to the compulsory reserve funds and the remainder carried forward to the present year No dividend has been paid.

Lead and Silver Discovery in Burma.—It is reported from Kalaw Shan States that an extremely rich silver and lead mine has been found at Heho, at the end of the Southern Shan States line, states a message from Rangoon dated September 14. It is stated that the new discovery is likely to prove one of the largest mines in the world.

Czecho-Slovakian Trade in July. — The official figures give the value of exports from Czechoslovakia in July as 1,008,000,000 crowns, and imports, 744,000,000 crowns. Export of chemicals and allied products were valued at 13,000,000 crowns, and 82,000,000 during the seven months ending July 31. Imports of chemical products during July also totalled 13,000,000 crowns, and 125,000,000 crowns since January 1, 1923.

Rubber Latex Exports.—Rubber latex made its first appearance as an item in the monthly return of exports from British Malaya in the month of June, 1922. Since that date to the end of June, 1923 (thirteen months) a total of 97,015 gallons, valued at £18,973., have been exported. Of this amount 72,409 gallons were exported to the United Kingdom, 20,792 gallons to the United States of America, 2,468 gallons to the Continent of Europe, 720 gallons to British Possessions, and 626 gallons to Japan.

Detection of Hydrocyanic Acid.—The United States Bureau of Mines has been conducting an investigation into the employment of colour test papers for detecting hydrocyanic acid vapour in the air of tanks, apparatus, and in ships and buildings after fumigation. A method was developed whereby the shade of colour produced in tests when compared with a colour chart gives an estimation of the concentration of the gas over a range of 25 to 1,000 parts per million parts of air. The investigators' determinations in the laboratory were within 20 per cent. of those found by chemical analysis. It is recommended that unprotected persons should not be allowed to enter atmospheres containing hydrocyanic acid gas unless tests show concentrations not exceeding 100 parts per million.

World's Salt Production. — The total world output of salt is estimated at about 17,200,000 tons before the war, and about 18,700,000 tons in 1920, an increase of more than 8 per cent, according to *Commerce Monthly*. In 1920, the United States headed the list of producers with 6,107,000 tons, against 4,300,000 in 1913; Germany 2,887,000 tons (1,888,000 tons); United Kingdom, 2,158,000 tons (2,248,000 tons); India, 1,764,000 tons in 1919 (1,299,000 tons in 1913); France, 1,230,000 tons (1,262,000 tons); Spain, 974,000 tons (59,000 tons); Japan, 580,000 tons (610,000 tons); and Russia, 539,000 tons (1,910,000 tons). It will be seen that whereas the production in the United Kingdom has fallen off slightly, the output in America has increased by 70 per cent., and the German production by 65 per cent. The output in Spain has also developed considerably during the period.

COMING EVENTS.

National Gas Exhibition.—September 17 to **October 3**, at Bingley Hall, Birmingham. Joint visit on **Tuesday, September 25**, by the Society of Chemical Industry and the Midland Junior Gas Association; meeting, **6 p.m.** Papers: "Specific Heat of Coal and Relation to Its Composition," by G. Coles; "A New Gas-fired Combustion Furnace," by T. J. Hedley; "Improvements in Net Value Calorimetry," by C. H. Beasley.

Institution of the Rubber Industry (London Section).—Meeting, **Monday, October 1**, at **8 p.m.**, at the Engineers' Club, Coventry Street, London, W. Paper: "Plantation Life from a Topical Point of View," by C. Baxendale.

Society of Chemical Industry (Bristol Section).—Meeting, **Thursday, October 4**, at **7.30 p.m.**, at the University, Woodland Road. Paper: "An Outline of Rubber Manufacture," by J. F. Reid.—**(Manchester Section)**: Meeting, **Friday, October 5.** Address: "Recent Progress in Chemistry," by the chairman of the Section, Dr. H. Levinstein.

Society of Public Analysts.—Meeting, **Wednesday, October 3**, at **8 p.m.**, at the Chemical Society's Rooms, Burlington House, Piccadilly, W. Papers: "The Sampling of Coal," by J. H. Coste, E. R. Andrews, and W. E. F. Powney; "A New Test for Distinguishing Castor Oil," by H. G. Stocks; "The Volumetric Estimation of Vanadium in Steel," by A. E. Etheridge; "The Iodimetric Determination of Sugars," by C. L. Hinton and T. Macara.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

Another furnace in the district has been put into blast on ordinary iron, and the position for the time being at all events is rather improved. It has to be confessed, however, that there is very little new business stirring in the West Coast hematite pig-iron market, and as regards the furnaces in North Lancashire it is still uncertain whether a curtailment of production may not become necessary. On the other hand the furnaces in West Cumberland are apparently assured of the absorption of their full output. Here at any rate no stocks are being accumulated, in spite of the fact that Continental requirements are very small now, and that the needs also of Scotland and South Wales are severely restricted. Most of the iron hitherto has been going to the Midlands. There is some prospect that the local consumption may shortly become larger. There are not many rail orders to be obtained, but the United Steel Company has got an order for rails from the Crown agents for the Gold Coast that will give the rolling mills employment, though not on a large scale, for many weeks. With a proportion of the make of ordinary iron going, therefore, to the steelworks at Workington it seems evident that all the coke that can be made in the district will be required. The output of local coke, the Whitehaven collieries having started raising coal, is of course increasing, and the coking industry must depend more than ever for the disposal of its products upon the hematite pig-iron industry. The East Coast coke supplies are little fuller this week, though there is an additional furnace blowing, and the presumption is that the extra coke needed is being taken from the West Cumberland ovens. Local iron smelters are still paying from 29s. to 33s. per ton according to carbon content, and deliveries overseas will be more important towards the end of the year. There is no change to note in the condition of the coal trade. The local outlet is restricted on account of the depressed state of the iron ore industry, but the shipments to Ireland are rather heavier. Brotherton and Co., Ltd., of Leeds, are shortly to dismantle their chemical works which they placed at Lonsdale Dock at Workington in 1910.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Belgium.

A Belgian firm in Brussels desires to secure the wholesale agency of British manufacturers of chemical and pharmaceutical products. (Ref. No. 291.)

Brazil.

A confidential memorandum on the market for photographic materials in Brazil has been prepared by the Department of Overseas Trade. British firms desirous of receiving a copy of the memorandum should communicate with the Department. (Ref. D.O.T. 905/3/F.G./C.C./2.)

Norway.

A commission agent in Christiania desires to secure the representation of British exporters of tinplates and olive oil for use in Norwegian canning factories. (Ref. No. 293.)

Poland.

The Commercial Secretary at Warsaw reports that a local bank is desirous of purchasing the following goods monthly: Soya bean oil, double refined, edible, 30 tons; coconut oil, refined, edible, 10 tons; tallow, Australian, fair mixed or another mark for soap-making factories, 20 tons. (Ref. D.O.T. 7931/F.R./C.C./2.)

Spain (Canary Islands).

A commission agent of Santa Cruz de Tenerife is desirous of obtaining the representation of British firms exporting paints, soaps, cement, candles, etc. (Ref. No. 294.)

Italy.

His Majesty's Consul at Turin reports that a local railway company is in the market for a considerable amount of pitch for use in the manufacture of briquettes. (Ref. No. 20579/F.W./M.C.2.)

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN AUGUST.

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during the month of August, 1923, compared with 1921 and 1922. As from April 1, 1923, the export trade of the Irish Free State is excluded from the returns.

(*To be concluded.*)

FERTILISER NEWS.

Nitrate of Soda.—There is not much of interest to record so far as the present situation in this fertiliser is concerned, the general market being very flat. Interest in the States is not at all keen, and consumers seem disposed to await a fall in prices. On the Continent a certain amount of material is moving inland from ports, but it is probable that the country dealers and manufacturers of compound fertilisers are taking the bulk. Farmers generally are too busy with harvesting and similar operations to concern themselves with next year's fertiliser requirements. Demand in this country is restricted to chemical manufacturers and sellers of small lots to gardeners, etc. The economic position of the industry has attracted considerable attention in the United States, and by this time Dr. Foster Bain, who went out recently to Chile on behalf of the United States Government to study conditions there, will have returned. His report is awaited with widespread interest. Meanwhile, a member of the United States Department of Agriculture has been giving his views on the Chilean industry before the American Chemical Society. His address dealt mainly with the question of unsatisfactory chemical engineering, which he believed was the fundamental reason for the present difficult situation. The advice he offers to the Chilean producers is to lower the price of the product, in order to eliminate the incentive to develop production of atmospheric nitrogen in other countries. Seeing that the export tax, taken by the Chilean Government, amounts to over 40 per cent. of the cost of production and sale, it is thought that the price might be lowered through a reduction in the tax. It is well known, of course, that the principal revenue of the country is derived from this source, but it might be possible to replace the loss by distributing it over the other exporting industries—namely, copper, iodine, etc. The general system of taxation in Chile is capable of considerable improvement, and until something is done in this direction the ultimate future of the Chilean industry is far from clear. The loss of Germany as a customer is largely responsible for the under-production, with its attendant working losses, at the present time, and there is little likelihood of an immediate return of this buyer to the extent of the 900,000 tons taken before the war.

Sulphate of Ammonia.—Although the export figures for August, as published in the Board of Trade returns, are lower, there is much cause for encouragement to be found in them. Exports during the month totalled 17,002 tons, compared with 20,586 tons in July and 14,649 tons in August of last year. Japan continues to be our best customer, taking some 7,450 tons during August, against 8,272 tons in July and 204 tons only in August, 1922. This country is purchasing all her sulphate requirements from us at the present time, the United States not being able to supply the fertiliser at a price low enough to compete with the British material. Up to the end of August—that is, for eight months—total exports to Japan from the United Kingdom have reached 36,114 tons, against a negligible 255 tons in the corresponding period of last year. The demand in Spain has fallen off somewhat, possibly due to her now having considerable stocks on hand. The fact that imports into that country from Great Britain amounted to 46,815 tons in the first eight months of this year, against 14,879 tons for the same period of 1922, lends support to this assumption. An encouraging feature of the statistics is the re-entry of France as a buyer at 972 tons after a brief period of cessation. This compares with 2,933 tons in August of last year. Eight months' figures show the exportation last year to be about double the quantity despatched to France this year. The sudden drop in exports of sulphate to Italy, only 15 tons, compared with 444 tons in July, is due largely to the lack of interest on the Italian fertiliser market. Supplies of German sulphate of ammonia received under the reparation scheme have been responsible for a break in prices, with the result that British sulphate is rather too high in price. The continual fluctuations in exchange, and, to some extent, the political situation, have also adversely affected the position of the British product. The British West Indies and the Dutch East Indies are both taking considerably less—in fact, the latter have fallen off seriously. "Countries not separately specified" is the only heading other than France to register an increase, taking 5,677 tons, against 5,381 tons in July, making the total since January 1, 32,300 tons, compared with 18,828 tons in 1922. In all, 161,148 tons were exported from the United Kingdom in the eight months' period to August 31, which compares very favourably with the figure of 88,748 tons for the corresponding period of 1922.

Other Fertilisers.—In common with sulphate of ammonia, the general trade in fertiliser products during 1923 is on a much higher level than in 1922. Business in basic slag is much better, and exports during August reached 4,872 tons, against 353 tons in July and 282 tons in August of last year. Imports were reduced, stocks of British-produced slag being larger on account of the activity in the iron and steel industry over the past few months. The August figure is 2,978 tons, against 8,726 tons for August a year ago. The total figures for the eight months are 59,994 tons for 1923, and 32,225 tons for 1922; while exports over the same period amount to 17,258 tons, and 6,074 tons respectively. Exports of superphosphate registered a considerable decrease on the monthly figure as compared with the previous month, although total exports since January 1 at 8,060 tons amount to almost double the quantity of British-manufactured material sent abroad in the 1922 period. Compound fertilisers, including bone meal, were exported up to 2,038 tons in August, against 3,604 tons in July, bringing the 1923 total to 35,261 tons, compared with 22,834 tons during the first eight months of 1922. Imports of bones and bone materials for fertiliser manufacture were rather lower on the month, though the total importation so far on the year is about 10 per cent. higher than in 1922. Raw guano has been neglected, and imports are negligible. Phosphate rock, on the other hand, has recovered somewhat, and the August imports, amounting to 31,584 tons, compared with 18,696 tons in July, make the total for 1923 up to August 31, some 222,082 tons, against 242,176 tons for the eight months' period of last year.

The German Potash Industry.—During the first months of 1923 customers showed a certain reserve, which was partly due to the anticipated effect of the action taken by the Reichsbank to stabilise the mark, states a German report circulated by the Board of Trade. When it became clear at the beginning of May that stabilisation could not be maintained, the demand of German agriculture set in on such a scale that—*e.g.*, in June—the highest monthly sales so far recorded by the potash industry were effected—viz., 90,000 tons K_2O (as compared with average monthly sales of 50,000 tons). In spite of these large sales, the level of the previous year has not yet been reached, but it is assumed that the difference will be made good during the following months, provided no unforeseen circumstances arise. Foreign countries in particular should contribute thereto, as foreign sales in 1923 have so far been generally satisfactory. The fact must not, however, be lost sight of that difficulties of sale in the potash industry would arise immediately if the costs of production were rapidly adjusted to the gold parity, but foreign exchanges were to show a sinking tendency. In such case, the potash industry would doubtless feel the competition of the Alsatian works on the world's market seriously. As before, the American and Dutch markets are the most important customers for German potash. The internal consolidation of the industry by the closing-down of unsatisfactory shafts, and the amalgamation of individual works in concerns, has made further progress. This policy of concentration is said to have proved exceedingly successful, and has resulted in a considerable reduction of the costs of production. Only thus has it been possible to keep the inland prices of potash comparatively low, so that the increase as compared with pre-war times is considerably less than in the case of other comparable products of German industry.

NEW COMPANIES.

Crums Prints, Ltd.—Private company. Capital £100. Dyers and calico printers, etc. Office: St. James's Buildings, Oxford Street, Manchester.

**** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

THE CONTROL OF OUR DYESTUFFS INDUSTRY.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—At the recent general meeting in Manchester of the British Dyestuffs Corporation (Limited), the Chairman indicated that the policy of the directors for the present would be not to strive after new discoveries, but to develop the cheaper manufacture of known products. This decision has led to the resignation of the chief research chemist of the Corporation, and, as pointed out in your leading article of August 31, the matter is of great public interest and importance, as it is generally recognised that the firm establishment of the dyestuff industry in this country is essential to our national security and industrial welfare.

It must be recognised that the directors are faced with enormous difficulties. Their capital charges and production costs are excessively high owing largely to conditions beyond their control; bad trade has greatly reduced the demand for their products in this country, and what export trade there is, is subject to the competition of Germany, Switzerland, and the United States. Dye users are strongly urging reduction in prices, and the shareholders in the Corporation have hitherto received a very meagre return. Under these conditions the directors are bound to adopt all possible economies which do not militate against ultimate success, and having spent £400,000. on research work during the past four years they propose to curtail such work in the future.

Two questions are involved. Is this policy the correct one; and, if not, what is the defect in the organisation which has led to its adoption?

With regard to the first point, the past history of the industry is very illuminating. It originated and was developed here for some years, but soon migrated to Germany, mainly because the large profits made were used here as dividends, but in Germany were utilised for research and works development. This fact, and the disastrous consequences of a repetition of the policy, have been pointed out again and again by those who have made a special study of the question. Did space allow, many such opinions could be quoted, but one must suffice—that of the man chiefly instrumental in developing the British dye industry during the war. Lord Moulton, speaking in Manchester in 1915, said: "If I had all the millions needed for a company, the shares of which would be considered as ordinary industrials, and the profits of which would be squeezed out without regard to the future, I would say at once that it was foredoomed to failure." The declared policy of the Corporation seems to be a repetition of the policy of the early sixties, which led to the shipwreck of the British dye industry in the early days. It is diametrically opposed to the policy which had led to success elsewhere. And in expending £400,000. in four years on research, the Corporation has only been fulfilling an essential condition. In the successful manufacture of dyes, research is as essential as raw material and special machinery, and, appositely enough, the *Board of Trade Journal* of August 30 (p. 216) gives the official figure of 21 million dollars as having been expended on dye research in the United States during the past five years. It is well known, also, that one of the large German colour works, the Badische Co., expended upwards of £900,000. on research on the synthetic production of indigo alone. Research is the lifeblood of colour manufacture, and the only wise policy in bad times is to intensify the work, which will lead to the introduction of new and valuable products from which a rich harvest will be reaped. To curtail research is to admit defeat by Continental and American competition.

It remains to consider the conditions which have made this retrograde step possible. These have arisen from the fact that scientific and technical knowledge and experience have been unable to exert their full energising and guiding practical influence. This is only possible when these factors are associated with and participate in final decisions in policy and administration. In other words, the present position is due to the absence of scientific and technical men from the directorate of the Corporation.

The fruitful result of a suitable collaboration of business men and scientific men is to be seen in all the large Continental colour works, and also in such British chemical works as Brunner, Mond and Company. Speaking during the war, Dr. Duisberg, one of the ablest industrial chemists in the world, and the head of one of the largest German colour works, is reported to have said:—"England talks not only of holding her own in the war, but of beating us in the organic chemical industry. She cannot do it, because she is incapable of the necessary concentration, patience, and the faculty of fixing the eye on distant consequences, and not merely on monetary results." Does not the avowed policy of the British Dyestuffs Corporation tend to show that his estimate was near the mark?—Yours, etc.,

Buckhurst Hill, Essex, September 15, 1923. WALTER M. GARDNER.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," September 22, 1888.)

Board of Trade Returns.—The Board of Trade returns for the month of August, which have been issued, show that the imports have reached a value of £30,006,140., which is an increase of £307,120. over August of last year; whilst the figures for the eight months are £250,287,359., which shows an increase of £13,026,743. The exports of British produce and manufactures are set down at a value of £21,187,759., an increase of £1,399,460. Foreign and Colonial produce, which is set down at £5,566,555., shows an increase of £1,404,475., while the total increase during the eight months is £15,652,000. Amongst the imports there is an increase in metals of £332,414., a decrease in raw materials for textile manufactures of £947,258. (the actual figure is £3,051,507.), and increase of £537,407. in raw materials for other industries, and an increase of £451,109. on manufactured articles. During the eight months there is an increase on all imports save dutiable articles of food and drink and tobacco. Among the exports the only decrease is in manufactured yarns and textile fabrics, which reached £48,477., or a total of £9,879,533. The largest increase is in metals, which reaches £437,505. On the eight months there is an increase all round, yarns and textile fabrics, which are set down at £72,947,538., showing an increase of £2,087,414. In the detailed statement it is shown that there is an increase in the value of chemical imports of £45,000., and in raw materials for the textile industry, and a decrease of £354,529. in raw cotton. The decrease in the exports on yarns and textile fabrics is principally caused by a decrease of £370,120. on woollen and worsted yarns.

REPORTS OF COMPANIES.

British Cellulose and Chemical Manufacturing Company, Ltd.

The accounts for the twenty months ended February 28, 1923, show a net loss of £491,781, as follows: Loss from manufacturing accounts for twenty months, £210,537.; written off on revaluation of stocks, £57,463.; depreciation of surplus unerected plant, and losses on plant sold or wholly written off, £229,270.; losses on cancellation of erection contracts, £11,216.; debenture and other interest, less interest received, £35,251.; total, £543,737.; transfer fees, £1,261.; balance of reduction of capital account unappropriated, £50,694.; net loss, as above mentioned, £491,781. Of the total loss, states the report, only £210,537. is due to trading over the twenty months. The balance consists of non-trading losses (including debenture and other interest) and also loss on sale of Spondon Power House, in itself over £114,000. Although there are, of course, no audited accounts later than those at February 28, 1923, monthly figures since that date show earnings more than sufficient to cover all charges and the debenture interest, but without regard to depreciation. Since the last annual meeting important developments and extensions have taken place at the Spondon factory, all of which are calculated, when the demand becomes commensurate with the increased capacity, to ensure great economies. The board propose to alter the company's name to "British Celanese, Ltd.," so as to abbreviate and identify it more closely with the company's principal product.

DIVIDENDS.

RECKITT AND SONS, LTD.—Dividend of 8d. per share, less tax, on ordinary.

STAVELEY COAL AND IRON COMPANY, LTD.—Report for year to June 30, 1923, states that profit, including balance of coal award, amounts to £304,912.; add £42,760. brought in, making £347,672. Directors propose placing £100,000. to general reserve and a final dividend of 5 per cent., making 7½ per cent. To mark the sixtieth year of company's operations directors propose paying bonus of 2½ per cent., bringing distribution up to 10 per cent. for year, leaving to be carried forward £4,191.

ASBESTOS CORPORATION OF CANADA.—Following dividends have been declared: Preferred stock 1½ per cent., common stock 1 per cent., for quarter ending September 30.

DOMINION GLASS COMPANY.—A quarterly dividend has been declared of 1¾ per cent. on the common stock.

VAN DEN BERGHS, LTD.—Directors have declared interim dividend of 1s. per share on ordinary shares in respect of 1923.

BRITISH ALUMINIUM CORPORATION, LTD.—Dividend at rate of 5 per cent. per annum, less tax, on ordinary shares for six months to June 30.

BENZOL AND BY-PRODUCTS, LTD.—Interim dividend of 3 per cent. on preference

SOUTH WALES NOTES.

[SPECIALLY CONTRIBUTED.]

Business in the tinplate trade continues good, and is slowly expanding. Large orders are being received from Japan for tinplates and galvanised sheets, which are required for reconstruction work following the earthquake. The European markets also are better. Spelter has been bought more freely, and it is reported that the galvanised sheet makers in some instances have obtained sufficient orders to last them over next January. The patent fuel trade is keeping steady, and some large export orders have been executed during the week. Small coals are in plentiful supply. The only noteworthy feature in the fertiliser industry at the moment is the improved export of basic slag.

Exports during the week included 489 tons sulphate of ammonia to Dunkirk from Cardiff. Included in the imports were 2,843 tons copper matte, 1,491cwt. nickel oxide, 20cwt. cobalt oxide from Montreal, 6,094 tons pitch from Pensacola, 101 tons nitrate of potash from Antwerp, 110 tons nitrate of soda, 140 tons ferro silicon, 8 tons magnesite from Christiania, 297 tons barytes from Bremen, to Swansea; 3 tons chloride of ammonia from Hamburg, 3cwt. beeswax from Antwerp to Newport; 1,360cwt. resin from Bremen, 1 case nickel oxide from Hamburg, and 1,799cwt. glucose from New York.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

September 3 to 8 (inclusive).

Anthraquinone Derivatives. Beckett, E. G.; Scottish Dyes, Ltd.; and Thomas, J. 22,166.
Mixing Liquids in Definite Proportions. Chambers and Hammond, Ltd.; and Hammond, T. C. 22,505.
Aluminium-fluoride-Alkali-fluoride Double Compounds Free from Iron. Chemische Fabrik Griesheim-Elektron. 22,616.
Ultra-filter Membranes. Duclaux, J. 22,639 and 22,640.

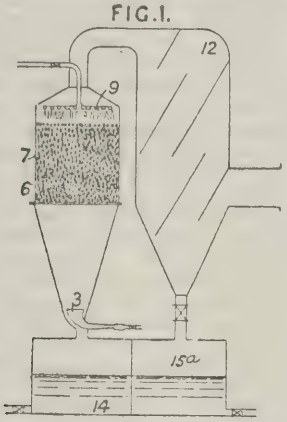
ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Spray and Film Evaporators. Plauson's (Parent Company), Ltd., London. (H. Plauson, Hamburg, Germany.) British Patent, **200,998**, of 1922.

In concentrating solutions or colloidal dispersions, or drying suspensions of kaolin, mineral colours, coal, peat, graphite, etc., the liquid is distributed as a fine spray or film in a current of gas or steam moving at a high velocity (50 metres per sec. and upwards). The stream is obtained by allowing the gas to expand through funnel-shaped nozzles which may be arranged to give a rotary movement to the gas. The liquid may be supplied by a distributor 9 on to the upper surface of a packing 7 of Raschig rings, etc., in a vessel 6 through which a stream of gas or steam from a nozzle 3 arises. Concentrated liquid carried by the gas is

FIG. 1.



separated in a baffled chamber 12 and flows into a container 15a. The bulk of the concentrated liquid passes from the base of the vessel 6 into a container 14. The liquid to be concentrated may be supplied by atomising it by means of air or gas, downwards into the lower part of the vessel 6 below the packing 7. The liquid may be supplied to a rotating device, from which it is discharged as a thin vertical film into a stream of gas or steam moving horizontally. Solid or liquid products are separated from the gas by passage through a series of baffles or sieves, the different products from which are collected in separate containers. Materials having a dehydrating, ionising, or deionising effect may be added to the gas, for example, in concentrating calcium chloride solution, a small addition of hydrochloric acid gas may be made, and in concentrating sugar solutions, additions of carbon dioxide or alcohol increase the rate of concentration, while strong acids decrease the rate.

Anthraquinone Sulphonic Acids. J. Thomas, and Scottish Dyes, Ltd., Carlisle. British Patent, **200,851**, of 1922.

The anthraquinone-α: β-disulphonic acids or their salts, such as are obtained as by-products in the sulphonation of anthraquinone in the presence of mercury, yield anthraquinone or its 2-sulphonic acid on hydrolysis with sulphuric acid of about 80 per cent. strength, at a high temperature. According to an example, anthraquinone is sulphonated with oleum in presence of mercurous sulphate, the anthraquinone-α-monosulphonic acid separated as potassium salt, and the α: β-disulphonic acids in the filtrate isolated by evaporation or salting out; the α-monosulphonic may also be isolated by slightly diluting the sulphonation mixture and cooling; the disulphonic acids are then heated with sulphuric acid of 80 per cent. strength and mercurous sulphate at 180° C., and the anthraquinone and β-monosulphonic acid separated by pouring into water and salting out.

Titanium Sulphates. W. B. Llewellyn, H. Spence, and P. Spence and Sons, Ltd., Manchester. British Patent, **200,848**, of 1922.

Titanium sulphates are prepared by impregnating titaniferous materials in granular condition or in small pieces with sulphuric acid of a suitable strength, and heating the impregnated mass in the dry way to a temperature of about 300° C. The concentration of the acid is preferably adjusted so that while sufficient acid is present to react with the titanium oxide and other reactive bases, the volume is such that a semi-dry homogeneous mixture is obtained. The process is stated to be particularly applicable to siliceous minerals or residues containing relatively low proportions of titanium oxide.

Alkali Cyanides. E. C. R. Marks, London. (E. I. Du Pont de Nemours and Co., Wilmington, Delaware, U.S.A.) British Patent, **200,902**, of 1922.

Alkali cyanides are obtained by reacting with nitrogen, which may be under pressure, upon a mixture of an alkali compound such as sodium carbonate, and carbon obtained from the matter dissolved by alkali from wood or other fibrous vegetable matter in the presence of a metal catalyst such as iron or iron oxide and, if desired, an alkali halide such as sodium chloride or fluoride. The carbon used is obtained by incinerating the "black liquor" obtained in cellulose manufacture, and washing out the sodium carbonate remaining. The heating of the solid residue of the black liquor may be effected in a retort at a comparatively low temperature below 550° C., preferably 200–350° C., to obtain a high yield; or the concentrated liquor may be mixed with the catalysts and evaporated to dryness to obtain a suitable charge for the cyanide reaction. The nitrogen may be supplied in the form of producer gas, but in that case the retort is sealed after the reaction and only open when cold, to avoid the presence of carbon dioxide with the cyanide during cooling. An increase in yield may be obtained by adding a second portion of charge to the retort when its original charge has shrunk owing to the process of reaction, and then continuing the reaction for the same or a little time longer than the original charge would have taken.

Alkali Thiosulphates. W. J. Mellersh-Jackson, London. (Keppers Co., Pittsburg, U.S.A.) British Patent, **200,760**, of 1922.

Liquors containing alkali thiosulphates and other less soluble alkali salts such as carbonates, which may be products of gas-purifying processes, are evaporated until the boiling point reaches 120° C. at atmospheric pressure, when the salts such as alkali carbonates separate, and the crystals are removed in a centrifugal apparatus. The solution is then cooled to obtain crystals of thiosulphate. The mother liquor may be further concentrated to obtain a second crop of thiosulphate crystals; the final mother liquor contains sulphocyanides. The thiosulphate crystals are washed and recrystallised, the mother liquor being returned to the evaporator.

Filtering Media. C. Torley, Quatre-Bras, near Tervueren, Belgium. British Patent, **200,327**, of 1922.

Filter plates or bodies are made of a mixture of cleaned pumice stone in fine granules with Portland cement. The mixture is moistened with steam or finely atomised water and moulded under pressure when cool. The moulded bodies are allowed to set, then immersed in water, and finally sterilised in a steam boiler at a pressure of from 1½ to 2 atmospheres. The cement is preferably roasted before use.

Lead Hydroxide. A. W. Topp, Oswestry, Shropshire. British Patent, **200,693**, of 1922.

Lead hydroxide is precipitated by adding alkalies, ammonia, calcium hydrate, or the like to a chloride solution containing lead, which may be prepared from lead ores or tailings by treatment with brine and calcium chloride at 70-80° C. and filtering off the calcium sulphate. The lead hydroxide is separated and dried at 80-102° C. It may be ground with oil for use as a pigment.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Vulcanising Indiarubber. Naugatuck Chemical Company, Naugatuck, Connecticut, U.S.A. (Assignees of S. M. Cadwell, Leonia, New Jersey, U.S.A.) British Patent, **200,788**. Convention date, July 13, 1922.

Indiarubber in solid form or in solution is vulcanised with or without heat by mixing it with sulphur, zinc oxide or certain other metallic compounds, carbon disulphide with or without addition of a substance, such as carbon tetrachloride, which reduces its inflammability, and a primary or secondary amine, which must be an aliphatic amine—*e.g.*, benzylamine, if the inflammability-reducing ingredient is absent. Carbon oxysulphide may be used instead of carbon disulphide. Suitable amines are methylamine, dimethylamine, diethylamine

benzylamine, dibenzylamine, piperidine, aniline, para-toluidine, triethyltrimethylenetriamine, and tribenzyltrimethylenetriamine. The carbon disulphide may either be added with the other ingredients during milling, or it may be applied subsequently by painting the articles with it or subjecting them to its vapour. The Specification contains several examples.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—A quiet market is recorded in all quarters, and the few orders booked are small in size. Prices, however, are being maintained. Continental offers, especially those from Germany, seem firmer, and this is being reflected on spot in some directions, such as caustic potash and hyposulphite of soda, pea crystals. **Acetic Acid,** 80% technical, £47.; 80% pure, about £51.; 98% glacial, £60. in casks and £73. in glass demijohns, ex wharf London; spot values are well maintained, with a good demand on the market, and supplies limited. **Acetone,** British Government specification, £125. to £127. per ton, in drums; inquiry for spot material continues, with little about; values firm. **Alum,** lump, in casks, £10. to £10. 10s. per ton; dealers' prices keep steady at these figures, but there is little business doing. **Arsenic,** Cornish white powdered, about £68. per ton; the spot position seems very unsteady, with prices varying. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; this market remains very quiet, with dealers' prices unaltered. **Barium Chloride,** 98—100%, about £15. per ton for crystals; at this price the market is firm, but business is quiet. **Bleaching Powder,** 35—37%, about £10. to £10. 10s. per ton; dealers' prices are inclined to be firmer; business poor. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain; British makers continue to quote at these prices for home trade only. Dealers are quoting under similar conditions as to packing and delivery at: Commercial, granulated, £23. 10s.; and powdered, £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers' prices are maintained at these recently reduced rates, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid in Great Britain; British makers' prices, for home trade only; dealers are offering some grades at competitive prices. **Cream of Tartar,** 99—100%, about 88s. to 90s. per cwt., less 2½%, for one-ton lots; dealers are quoting at this unchanged rate, but business is slow, and the market is none too firm. **Citric Acid,** B.P., about 1s. 6d. per lb., less 5%; dealers' quoted rates are at this unchanged price, but the few sales made would be much under this figure for quantities; the position is very unsteady. **Epsom Salts,** commercial quality, about £5. per ton, in bags; dealers quoting at this price find business very slow. **Formaldehyde,** 40%, about £75. per ton; dealers are offering somewhere round this figure, but the little business about would probably be at slightly easier rates. **Glauber's Salt,** commercial quality, about £3. 15s. to £4. per ton; there is little business about so far as dealers are concerned. **Lead Acetate,** brown, about £40. to £41.; white, about £42. per ton; prices are quoted about the same, but business remains slow, and the market is unsteady. **Litharge,** about £35. 10s. to £36. per ton; dealers are offering Continental material at about these prices, with not much doing. **Lithopone,** 30% Continental red seal, £22. 10s. to £23. per ton; importers continue to find fair business, and their prices keep very steady. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31.; the tone here is, if anything, a shade firmer, with a tendency to higher prices. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers' quoted prices are unaltered. **Oxalic Acid,** about 6d. per lb.; this market remains very dull, and quoted prices are not at all steady. **Carbonate of Potash,** 90—92%, about £26. 10s. to £27.; 96—98%, about £30. per ton; prices asked by dealers are just a shade easier this week, with business still poor. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; hardly any inquiry on the market. **Caustic Potash,** 88—92%, about £31. to £31. 10s. per ton, in drums; after a period of dull and easier markets, this material has recovered sharply, owing to much higher rates on the Continent. **Permanganate of Potash,** commercial quality, about 9½d. to 9¾d. per lb.; business has been fair, and quoted values are well maintained. **Prussiate of Potash,** yellow, about 1s. per lb.; dealers have made no further reduction in their prices, and the market now seems much steadier, although business is still limited. **Sulphate of Potash,** 90%, £11. 10s per ton, ex ship; the market is unchanged on the week **Mercury,** about £9. per bottle of 75-76lb.; the spot position is still on the quiet side, with values as quoted none too steady. **Red Lead,** imported, about £35. 10s. to £36. per ton; dealers' prices are steadily maintained in this region, with some occasional business about. **Salammoniac,** dog-tooth crystals, £48. 10s. to £49.; medium, £43. to £44.; fine white crystals, £25. to £26. per ton; the spot position seems to be somewhat firmer, and slightly higher prices may be looked for shortly; spot supplies are offering. **Saltcake,** ground and unground, home trade, about £4.; export, about £5. 5s. per ton, f.o.b.; at these rates the position keeps quite steady. **Acetate of Soda,** about £24. 10s. to £25. per ton; some little inquiry has been dealt with at about these prices. **Soda Ash,** 58% light alkali, £7. 12s. 6d. per ton, in bags; British makers continue to quote at this price for home trade only, carriage paid in Great Britain; their prices for export vary as to destination. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s., per ton, in drums, ex wharf shipping port; dealers' prices show no change, and business seems to be still rather poor. British makers' prices to domestic consumers on contract are unchanged at: 70—72%, £16. 17s. 6d.; 76—77%, £18. 7s. 6d. per ton, in drums, carriage paid to destination; makers' prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers quote at about this figure, for home trade only, packages free, carriage paid in Great Britain. **Bichromate of Soda,** home trade, about 4½d. per lb.; export, slightly more; British makers' prices stated; no change on the week. **Cyanide of Soda,** 98—100%, export, 8½d. to 9d. per lb.; British makers' prices are unaltered on the week. **Hyposulphite of Soda,** pea crystals, about £14. to £14. 5s. per ton, in 1cwt. kegs; commercial quality, about £9. per ton, in casks, for spot supplies; c.i.f. quotations are a little easier than these rates; the position generally is firmer. **Nitrate of Soda,** 96%, about £13. 7s. 6d. per ton, f.o.r. or f.o.b.; at this price the market keeps steady, but is rather quiet. **Nitrite of Soda,** 100%, about £26. 10s. per ton; this market holds quite firm. **Prussiate of Soda,** about 6d. per lb.; business is still slow and small, with dealers' prices showing no further decline. **Sodium Sulphide,** 60—62% solid, about £14.; ditto, broken, about £15. 5s. per ton, in drums; 60—65% concentrated, about £14. per ton, in casks; prices quoted are about the same, but business is small. **Sulphate of Copper,** £26. per ton; British makers' quotations for home and export are at about this price, but Continental offers seem cheaper. **Tin Crystals,** 1s. 4d. per lb.; the market shows no change on the week. **Tartaric Acid,** B.P., crystals, about 1s. 2d. per lb.; business has shown no improvement, and the tone of the market is still unsteady and likely to weaken. **White Lead,** imported, about £42. per ton; prices mentioned are perhaps a little easier, with some limited business about. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers report there is no change in their prices.

Pharmaceutical Chemicals.—One or two changes in values, showing advances and declines, are recorded. The market generally is on the quiet side, with most business very limited in size, and the tone is fairly steady. **Acetanilid,** crystals and powder, about 1s. 7d. per lb.; the improvement in price recorded last week is fully maintained. **Acetyl-Salicylic Acid,** B.P., about 3s. 1d. per lb.; spot material seems steady at about this figure for good brands. **Benzoic Acid,** B.P., 2s. 3d. to 2s. 6d. per lb.; there is seldom any inquiry on the market. **Diethylbarbituric Acid,** B.P. (barbitone), about 17s. per lb.; the spot quotation is easier this week, with the market dull. **Salicylic Acid,** B.P., about 2s. 3d. to 2s. 4d. per lb.; at these rates the spot position is quite steady. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; business is rather slow, but a steady tone is maintained. **Amidopyrin,** about 14s. 6d. per lb.; the market remains quiet, and values as quoted are inclined to be weak. **Ammonium Bromide,** about 7d. per lb.; spot business is still slow and small, and values are unsteady. **Benzonaphthol,** about 5s. per lb.; nominal; no inquiry during the week. **Betanaphthol,** resublimed, 1s. 10d. to 2s. per lb.; the demand on spot is only occasional, with values unchanged. **Benzaldehyde 03,** about 3s. per lb.; holders of spot supplies continue to offer at this figure, with business quiet. **Calcium Lactate,** about 1s. 9d. per lb.; some fair business has been done, with the market steady. **Chloral Hydrate,** duty paid, about 4s. per lb.; slightly less for quantities. **Creosote,** B.P., about 2s. 6d. per lb.; quoted values are unchanged, with the market dull. **Creosote Carbonate,** about 8s. 6d. per lb.; inquiry very small; quoted rates unaltered. **Guaiacol Carbonate,** about 8s. 3d. per lb.; nominal; market inactive. **Hexamine,** about 3s. 6d. to 3s. 9d. per lb.; spot offers at these prices meet with only a limited demand. **Hydroquinone,** 3s. 3d. to 3s. 6d. per lb.; the demand has been poor; prices as quoted are not firm. **Methyl Salicylate,** about 2s. 6d. per lb.; this item keeps quite steady, with a fair business passing. **Methyl Sulphonal,** about 15s. per lb.; little or no inquiry received; quoted rates unchanged. **Paraformaldehyde,** about 3s. 6d. per lb.; the market is a shade easier this week, with business still quiet. **Paraldehyde,** 1s. 5d. to 1s. 6d. per lb.; some limited inquiry has been dealt with at about these prices. **Phenacetin,** about 6s. per lb.; this market seems to have recovered a little of its fall recorded last week. **Phenazone,** 7s. 3d. to 7s. 6d. per lb.; spot offers are at about these figures, with business quiet. **Phenolphthalein,** 6s. 6d. to 6s. 9d. per lb.; the market is well maintained at these prices, with business small. **Potassium Bromide,** B.P., crystals and granular, 6d. to 7d. per lb.; offers appear to be ample, with buyers scarce; prices are unsteady. **Potassium Permanganate,** B.P., about 10d. per lb.; a fair business continued here, with values quite steady. **Potassium Sulphoguaiacolate,** 5s. 6d. per lb.; prices mentioned are easier this week, but there is hardly any business about. **Sodium Benzoate,** about 2s. 6d. per lb.; nominal on an idle market. **Sodium Diethylbarbiturate,** about 18s. 6d. per lb.; quoted rates for spot material are unchanged; business very limited. **Sodium Bromide,** B.P., crystals and granular, about 7½d. per lb.; this material seems to have improved a little on spot, but some cheaper offers may still be found. **Sodium Salicylate,** powder, about 2s. 5½d.; crystals, about 2s. 8d. per lb.; at these levels the spot market keeps very steady, with fair inquiry on hand, and supplies rather limited. **Sulphonal,** about 14s. 6d. per lb.; this market has been quiet; values unchanged. **Terpin Hydrate,** about 1s. 9d. per lb.; the position keeps very steady, with occasional small business passing. **Thymol,** about 15s. per lb.; spot holders' quotations are maintained at this figure. **Vanillin,** 100%, about 23s. 3d. per lb.; the market keeps steady at this price.

Coal-tar Products, Intermediates, Etc.—The only change of importance to record here is a sharp fall in the price of pitch, which remains quiet. Other items are about the same, with business restricted. **Aniline Oil,** 9d. to 9½d. per lb., drums free; the market has been quiet, with quoted values unchanged. **Aniline Salt,** 9½d. to 10d. per lb., casks free; prices asked are about the same, with little inquiry on the market. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; inquiry is still slow, and prices quoted are unaltered. **Benzol,** 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; this item keeps very steady, although the demand remains slow. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; there has been no improvement in demand; makers' prices are unaltered. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; dealers' prices are level on the week, with little doing. **Naphtha,** about 1s. 4d. per gallon; this market is dull, and prices as quoted are not at all firm. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; the easier prices recorded last week are maintained, with the market dull. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; prices show no further falling-off, but business remains very quiet. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; this market is unchanged, and keeps steady. **Burning Oil,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; prices are steady, with the market quiet. **Creosote Oil,** about 9½d. per gallon, f.o.b.; merchants offering at this unchanged price find little business about. **Carbolic Acid,** crystals, about 1s. 2d per lb., f.o.b.; this is about the lowest price now being quoted; the market is steadier and a little more active. **Naphthalene,** about £19. 10s. to £20. per ton; the tone has improved a little after last week's easier feeling, but there is still but little business doing; crude, £5. to £11.; crystals £23.; powder, £17.; balls, £24.; candles, £28.; tablets, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; demand remains slow, with quoted values unchanged. **Pyridine,** 20s. per gallon; the spot position holds very firm, with inquiry good, and supplies available very limited. **Hexamethylene,** about 3s. 9d. per gallon; prices are a shade easier this week, with business on the quiet side. **Pure Methyl Alcohol,** £100. per ton, ex wharf London; this item keeps very steady, and fair business is being done. **Pitch,** about 125s. per ton, East Coast; the quotation is easier this week, with very little business being dealt with. **Sulphate of Ammonia,** home trade, 25¾%, about £14. 10s. per ton, delivered buyers' nearest station.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £62. 2s. 6d. to £62. 5s., cash; £62. 15s. to £62. 17s. 6d., three months; electrolytic, £67. 10s. to £68. **Tin**: Standard, £198. 2s. 6d. to £198. 5s., cash; £198. 15s. to £198. 17s. 6d., three months; Straits, £202. 2s. 6d.; English, £199. **Lead,** soft foreign, £25. 7s. 6d., prompt; English, £26. 15s.; chemical sheet, 34s. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 2s. 6d.; hard, £27. **Antimony,** English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium,** 98—99%, £115.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £8. 15s. to £8. 17s. 6d. **Bismuth,** 10s. **Platinum,** 500s. per oz. **Wolfram,** spot, 12s. to 12s. 6d. per unit. c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 90—92%, £47. 10s. per ton, delivered; Beaver brand, 90%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand generally for heavy chemicals during the past week has been rather better, but values as a whole show no signs of improvement. For alkali products, quotations continue unchanged at recent rates—namely: **Caustic Soda,** 70%, £17. 17s. 6d.; 58% **Alkali,** £7. 12s. 6d.; **Soda Crystals,** £5. 5s. **Bicarbonate of Soda,** 2cwt. bags, £10. 10s., all carriage paid. **Bleaching Powder,** softwoods, unchanged at £11. 5s. on rails for spot orders. The inquiry for **Chlorates** is on the small side—**Potash** at 3d., and **Soda** 2¾d. per lb., carriage paid. **Bichromates** are unaltered. There is little call for **Copper Sulphate,** and quotations remain nominal at £25. 10s. to £26., f.o.b. Liverpool. American **Rock Sulphur,** steady at £5. 5s. on rails. **Phosphate of Soda,** weak at £14. 10s., ex store. **Commercial Hyposulphite of Soda,** £9. 10s., on rails makers' works. **Nitrite of Soda,** firm at £26. 10s., ex store. **Concentrated Sodium Sulphide,** in good supply at £14., carriage paid. White powdered **Arsenic,** lower at £65., on rails Cornish works, with only small inquiry. **Yellow Prussiate of Potash,** weaker at 1s. 0¾d. per lb.; **Soda,** 5¾d. per lb., both carriage paid. **Caustic** and **Carbonate of Potash** have a lower tendency. Grey **Acetate of Lime,** easier at £21. 10s., carriage paid; brown unchanged at £11. 10s. per ton **Acetic Acid,** firmly maintained at recent rates. **Acetate of Soda,** dull at £24. 5s. to £24. 10s., ex store. Miscible **Wood Naphtha,** quiet at 6s. 6d. per gallon, carriage paid. **Acetone,** lower at £127. per ton. **Lead Salts** are firm; white **Acetate** at £42., brown £43.; and **Lead Nitrate** £42. per ton, carriage paid. **Green Copperas** is in fair re-

quest at recent rates. **Barium Chloride,** steady at £14. 10s. per ton. **Oxalic Acid** neglected at 5¾d. to 6d. per lb., carriage paid. **Permanganate of Potash,** firm at 9½d. per lb. for B.P. crystals.

SWANSEA MARKET REPORT. Wednesday.

Tinplates maintained their firmness, and business was steady on the basis of £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** were in good demand, quotations being based on £18. 17s. 6d. per ton, f.o.b. **Copper** rather easier, with prompt at £62. 7s. 6d., and three months £63. 2s. 6d. per ton. **Tin,** prices somewhat irregular and easier at £193. 7s. 6d. per ton cash, and £194. 7s. 6d. three months. **Lead** in fair demand, and steady at £25. 12s. 6d. per ton prompt, and £25. 2s. 6d. forward; English, £27. **Spelter** rather weaker, with prompt at £32. 12s. 6d. per ton, and forward £32. 17s. 6d. **Zinc Sheets,** in good demand at £39. 7s. 6d. per ton, on truck at makers' works. **Pitch** quiet, with downward tendency at £6. 10s. 6d. per ton. **Oxalic Acid,** slow trading at 6¼d. per lb., f.o.b. **Sulphate of Ammonia** slow, with improved inquiry at the fixed prices. **Sulphate of Copper,** at £26. 2s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda,** quiet at £13. 5s. 6d. per ton, prompt; and £13. 12s. 6d. forward. **Bonemeal** better sought for; Indian, prompt, £9. 2s. 6d. per ton, in bags. **Arsenic,** very quiet at £69. 2s. 6d. per ton for white powdered. **Copperas** rather quiet at £2. 2s. 6d. per ton, delivered London or equal. **Benzol,** quieter at 1s. 4d. per gallon. **Creosote Oil,** quiet at about 9¾d. per gallon, f.o.b. **Turpentine** steady, with American, prompt, at £3. 17s. 3d. per cwt. **Linseed Oil,** raw, £2. 4s. 3d.; and boiled, £2. 6s. 9d. per cwt. **Cottonseed Oil,** common edible £2. 2s. 9d.; deodorised, £2. 5s. 9d. **Coconut Oil** firm, with Ceylon at £2. 4s. 3d. per cwt. **Olive Oil,** very quiet at £63. 17s. 6d. per ton. **Palm Oil** held firmly, with Lagos at £37. 2s. 6d.; softs, £36. 17s. 6d.; mediums, £36. 15s.; and hards, £37. 2s. 6d. **Coal** prices steady: Best Admiralty smokeless, £1. 8s. 3d.; seconds, £1. 6s. 6d.; ordinaries, £1. 6s., all per ton, f.o.b. **Anthracite** qualities in good call; best large, £2. 10s. 3d.; seconds, £2.; Paris, £3. per ton, f.o.b. **Patent Fuel** prices were upheld at £1. 10s. to £1. 13s. per ton. **Cokes** offered freely, with easier terms at £2. 2s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in trucks at ovens.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Business in chemicals of the heavier class has again been very fair in the home branch of the trade, the demand for some products being more active. In the export branch shipments, on the whole, have been on a larger scale, and are proceeding briskly at date. **Bleaching Powder** has been rather more in request, and is £10. 5s. to £10. 7s. 6d. per ton for the home trade, and £11. 5s. to £11. 17s. 6d. per ton for export. **Chloride of Calcium** has had a moderate inquiry, and is £5. 12s. 6d. per ton. **Caustic Soda** has been in fair demand for use in the United Kingdom, and has been shipped more freely for foreign ports; it is £19. to £20. per ton for 76%, carriage paid, for the home trade. **Bicarbonate of Soda** has sold rather freely for use in the United Kingdom, and has had a fairly large shipment; it is £10. 10s. per ton, carriage paid, for home-trade uses. **Soda Crystals** have again been in very fair demand for use in the United Kingdom, but have been quiet in the export branch; they are £5. 5s. per ton, carriage paid, for the home trade. **Nitrate of Soda** has been but little called for, and is £13. 5s. to £13. 10s. per ton. **Borax** has been in steady demand; commercial crystals are £25. per ton, and powdered £26.; higher grade crystals are £29. per ton, and powdered £30.; superfine is £31. per ton. **Saltcake** has been in rather good request, and is £4. 10s. to £5. per ton for use by the home trade, and is £5. to £6. per ton for export. **Bichromate of Soda** has been in very fair demand, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has had a somewhat free sale for home-trade use, and has been shipped more largely for export; it is £7. 12s. 6d. per ton for the United Kingdom, and £8. per ton for export, this price varying somewhat according to destination. **Hyposulphite of Soda** has been quieter; it is £10. to £10. 10s. per ton, in 2cwt. bags, for commercial; and £15. to £16. per ton for the photographic quality, in 1cwt. kegs, according to quantity. **Sulphide of Soda** has been rather more in request; solid is £14. 10s. to £15. per ton, and crystals £8. 10s. to £9. per ton. **Chlorate of Soda** has been but little called for, and is 3d. to 3¼d. per lb. **Phosphate of Soda** has been very quiet, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been inactive, and is 6½d. per lb. **Yellow Prussiate of Potash** has been in quietly steady demand, and is 1s. 1d. per lb. **Red Prussiate** has been but little called for, and is 3s. per lb. **Carbonate of Potash** has had a very fair inquiry, and is £25. to £31. per ton, according to quality. **Nitrate of Potash** has been in quietly steady demand, and is £29. to £30. per ton. **Chlorate of Potash** has been very quiet, and is 3½d. to 4d. per lb. **Caustic Potash** has had a fair inquiry, and is £29. to £30. per ton. **Permanganate of Potash** has had a rather free sale, and is 9½d. to 9⅝d. per lb. **Bichromate of Potash** has been more in request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been in moderate demand; first quality is £60. per ton, and second quality £57. per ton. **Sulphate of Ammonia** has had a very limited inquiry on home-trade account, but has again been shipped on a large scale for exportation; neutral of 25¾% is £14. 10s. per ton, and ordinary of 25¼% £13. 7s. per ton, for use in the United Kingdom. **Carbonate of Ammonia** has been more in request, and is 4d. per lb. **Muriate of Ammonia** has been quiet; grey is £32. per ton. **Magnesia** continues in very fair demand; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been quiet; for the home trade £12. per ton is quoted, and for export £11. to £11. 10s. per ton. **Sulphate of Alumina** has been in moderate demand, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been in fair request; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s., and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has been quieter, and is 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has been steadily called for, and the price has eased; it may be given as £4. 10s per cwt. **Boric Acid** has been rather quiet; commercial crystals are £48. per ton, and powdered £51. per ton in bags, and £2. per ton more if in casks. **Citric Acid** has been quieter, and the price is lower; it is 1s. 6½d. to 1s. 7d. per lb. **Oxalic Acid** has moved but slowly, and is slightly cheaper; it is 6d. per lb. **White Acetate of Lead** has been but little called for, and is £42. to £43. per ton. **Sulphate of Copper** continues very quiet for the home trade and for export; the price is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been rather more in request, and is £68. to £70. per ton for white powdered.

WEST OF SCOTLAND CHEMICALS. Wednesday.

Demand on home-trade account has been fairly steady during the past week, but export inquiries are limited, with little prospect of immediate improvement. Such trade as there is in the export branch is mainly the fulfilment of orders booked over long periods for standard commodities. Prices generally are steady, and quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, lower at £73. per ton on spot; new supplies coming in are round about £70. per ton; a quiet market. **Barium Chloride,** £15. per ton; this figure is unchanged, and there is nothing of interest to record. **Bleaching Powder,** a shade lower at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under these figures. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at the recently reduced figure of £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride,** 70—75%, solid, £5. 12s. 6d. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid,** reduced to 1s. 6d. per lb., less 5%; little business about at the easier quotation. **Copper Sulphate,** £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar,** £4. 5s. per cwt. for 99% at Glasgow; quotation unchanged, and inquiry small. **Lead Acetate,** white, £41. 10s. per ton on spot; brown, more inquiry at £42. 10s. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 10s. per ton, ex store; a rather better tone is noticeable in this market, although foreign supplies now arriving are quoted at under this figure **Oxalic Acid,** quiet at about 6¾d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** lower at 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. 2½d. per lb.; this

is a dull market, in spite of the reduction of ½d. on the week. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals, £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 10s. per cwt., net; a better market, with quotation rising. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 10s. per ton in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; rather easier, and inclined to be dull. **Tartaric Acid,** 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

OFFICIAL AMENDMENT.

To return for week ending August 25 add

IRON PYRITES—
——— 12 t.

Week ending September 15.

ACETATE OF LIME—
Antwerp, 165 bgs.

ACETIC ACID—
Hamburg, 91 crbys., 82 blns.; Montreal, 742 brls.; Rotterdam, 15 cks.

AMMONIUM SULPHATE—
Marseilles, 540 bgs.

BARYTES—
Bremen, 22 cks., 230 bgs.

BEESWAX—
New York, 5 cs.

BLEACHING POWDER—
Hamburg, 40 cks.
Genoa, 80 brls.

CALCIUM CARBIDE—
Amsterdam, 400 drms.; Gothenburg, 600 drms.; Skien, 40 drms.

CALCIUM CHLORIDE—
Hamburg, 162 drms.

CAUSTIC POTASH—
Hamburg, 35 drms.

CHEMICALS (*otherwise undescribed*)
Bremen, 1 cs., 41 cks.
Hamburg, 193 cks.

CITRIC ACID—
Marseilles, 50 cks.

CREAM OF TARTAR—
Marseilles, 50 brls., 22 cks.

DEXTRINE—
Bremen, 12 cks.
Hamburg, 150 bgs.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Bremen, 30 cks.
Hamburg, 2 pkgs.

DYESTUFFS (NATURAL)—
Logwood
New York, 167 cks.

FELSPAR (POTASH)—
Christiania, 400 bgs.

FERRO CHROME—
Trondhjem, 250 cs.

FERRO SILICON—
Skien, 301 cs., 109 drms.

FORMALDEHYDE—
Bremen, 15 crbys.; Hamburg, 339 crbys.; Rotterdam, 27 crbys.

GLUCOSE—
New York, 25 brls.
Rotterdam, 105 cks.

GLUE—
Antwerp, 45 bls.; Hamburg, 21 bgs.; Rotterdam, 4 cks.

GLYCERINE—
Rotterdam, 3 drms.

INFUSORIAL EARTH—
Hamburg, 326 bgs.

LEAD ACETATE—
Rotterdam, 2 cks.

LITHOPONE—
Bremen, 40 cks.
Rotterdam, 420 cks.

MAGNESITE—
Amsterdam, 200 bgs.

MAGNESIUM CHLORIDE—
Hamburg, 722 drms.

MAGNESIUM SULPHATE—
Rotterdam, 717 bgs.

NICKEL SULPHATE—
Treport, 23 cks.

OXALIC ACID—
Hamburg, 5 brls.

PARAFFIN WAX—
New York, 153 cs., 130 brls.

PARALDEHYDE—
Hamburg, 1 cs.

PHOSPHORUS—
Montreal, 400 cs.

POTASSIUM BROMATE—
Bremen, 3 cs.

POTASSIUM CHLORATE—
Hamburg, 50 brls.

POTASSIUM PERMANGANATE—
Hamburg, 200 drms.

PRUSSIAN BLUE—
Rotterdam, 6 cks.

SALT—
Hamburg, 465 bgs.

SOAP—
Marseilles, 10 cs.
Valencia, 50 cs.

SODIUM ACETATE
Jersey and Rouen, 24 cks.
Hamburg, 27 cks.

SODIUM BICHROMATE—
Baltimore, 113 cks.

SODIUM CHLORATE—
Hamburg, 100 cks.

SODIUM HYPOSULPHITE—
Hamburg, 5 cks.

SODIUM NITRATE—
Hamburg, 145 cks.

SODIUM PRUSSIATE—
Rotterdam, 34 cks.

SODIUM SULPHIDE—
Hamburg, 16 cks.

STEARINE—
Antwerp, 41 bgs.

TANNING MATERIALS—

Buenos Aires, 38 t. 18 c., £1,871.; Corral, 16 c. 2 qrs., £38.; Curacao, 3 c., £12.; Monte Video, 1 t. 17 c., £30.; Puerto Deseado, 11 t. 9 c., £875.; Rio Gallegos, 7 t. 18 c., £340.; Rosario, 8 t. 1 c., £318.; San Julian, 11 t. 9 c., £875.; Sydney, 12 t. 10 c., £411.; Santa Cruz, Argent., 9 t. 16 c., £420.; Yokohama, 8 c., £26.

SULPHURIC ACID—
Delagoa Bay, 6 c. 2 qrs., £24.

SUPERPHOSPHATE—
Demerara, 5 t. 17 c., £25.
Seville, 148 t. 14 c., £478.

TANNING MATERIALS—
Oak
Havre, 1 t., £10.
Unspecified
Antwerp, 2 t. 3 c., £60.; Alexandria, 2 t. 4 c., £49.; Copenhagen, 2 t. 13 c., £48.; Dantzig, 1 t. 1 c., £27.; Hamburg, 8 t. 8 c., £397.; Lyttleton, 3 t. 12 c., £47.; Melbourne, 6 t. 15 c., £198.; Malmo, 7 t. 14 c., £208.; Montreal, 13 t. 10 c., £180.; Rotterdam, 11 t. 4 c., £134.; Sydney, 2 t. 5 c., £75.

TAR (*otherwise undescribed*)—
Bilbao, 8 c. 2 qrs., £31.

TARTARIC ACID—
Adelaide, 2 t., £259.; Brisbane, 15 c., £97.; Christchurch, 16 c., £97.; Melbourne, 2 t. 5 c., £297.; Rangoon, 2 c., £17.; Sydney, 10 c., £65.; Singapore, 5 c., £33.

TIN CHLORIDE—
Demerara, 19 c., £103.

TIN OXIDE—
Paranagua, 6 c., £69.; Rio de Janeiro, 19 c., £228.; Sydney, 7 c. 2 qrs., £87.

VANILLIN—
Fremantle, 2 qrs., £53.
Melbourne, 5 c. 2 qrs., £627.

WOOD PRESERVATIVE—
Auckland, 2 t., £47.; Barbados, 1 t. 7 c., £38.; Panama, 14 c., £20.; St. John's, N.F., 1 t. 5 c., £40.; Sarawak, 10 c., £16.; Wellington, 4 t., £93.

ZINC OXIDE—
Melbourne, 3 t., £132.
New York, 4 t. 19 c., £205.

Week ending September 14.

CALCIUM CHLORATE—
Buenos Aires, 342 pkgs.
Montreal, 112 pkgs.

CAUSTIC POTASH—
Wellington, 62 drms.

CAUSTIC SODA—
Adelaide, 213 drms.; Alexandria, 34 drms.; Auckland, 107 drms.; Bangkok, 24 drms.; Bari, 188 drms.; Batavia, 73 pkgs., 50 drms.; Beira, 30 drms.; Bergen, 20 drms.; Bourgas, 60 drms.; Brisbane, 32 drms.; Buenos Aires, 37 pkgs., 85 drms.; Calcutta, 87 drms.; Christiania, 80 pkgs., 20 drms.; Cheribon, 25 drms.; Cochin, 100 drms.; Copenhagen, 45 drms.; Corfu, 12 pkgs.; Delagoa Bay, 18 cs.; Dar-es-Salaam, 14 pkgs. ETHER—
Brisbane, 1 cs., £7.
Durban, 2 cs., £11.

ETHYL CHLORIDE—
Shanghai, 1 pkg., £10.
Vancouver, 1 cs., £12.

FERTILISERS (*otherwise undes.*)—
Baltimore, 100 t., £560.
Copenhagen, 2 t. 10 c., £63.
Channel Islands, 5 t. 10 c., £77.

FORMALDEHYDE—
Madras, 3 cs., £9.

GALLIC ACID—
Calcutta, 1 cs. (pt.), £7.

GLYCERINE—
Amsterdam, 29 t. 2 c. (F.), £1,700.; Calcutta, 1 c., £5.; Colombo, 10 c., £63.; New York, 2 c., £15.; Pt. Said, 1 c., £5.; Shanghai, 3 t., £270.; Trinidad, 2 c., £12.

HYDROBROMIC ACID—
Calcutta, 1 cs., £7.

HYDROCHLORIC ACID—
Benkoelen, 2 t. 4 c., £99.
Buenos Aires, 2 c., £7.
Madras, 2 c., £5.

HYDROFLUORIC ACID—
Hong Kong, 4 cs., £30.

HYDROGEN PEROXIDE—
Buenos Aires, 10 cs., £25.; Colombo, 3 cs., £13.; Durban, 20 cs., £33.; Santander, 2 cs., £17.

HYPOPHOSPHITES (*otherwise undescribed*)—
Oamaru, 2 cs., £29.

HYPOPHOSPHITE OF LIME—
Barcelona, 10 cs., £196.
Genoa, 6 cs., £118.

IODIDES (*otherwise undescribed*)—
Demerara, 1 cs. (pt.), £8.; Jamaica, 1 cs. (pt.), £10.; Trinidad, 1 cs. (pt.), £6.

IODINE—
Calcutta, 1 cs., £26.
Rio de Janeiro, 1 ck. (pt.), £50.

IODINE (RESUBLIMED)—
Alexandria, 2 cs. (pt.), £22.; Calcutta, 5 cs. (pt.), £7.; Sydney, 1 cs. (pt.), 1 cs., £80.

IRON AMMONIUM CITRATE—
Bombay, 1 cs. (pt.), 1 cs., £24.; Calcutta, 1 ck., £27.; Alleppey, 8 cs., £55.; Karachi, 2 cs. (pt.), £14.; Sydney, 1 cs. (pt.), £7.

IRON PERCHLORIDE—
Sydney, 1 cs., £134.

IRON SUBCARBONATE—
Karachi, 3 cs., £7.

LEAD ACETATE—
Brisbane, 5 kgs., £11.

LEAD SULPHATE—
Antwerp, 129 cks., £150.

MAGNESIA—
Auckland, 5 cs., £12.; Brisbane, 3 cs., £7.; Calcutta, 4 cs., £10.; Havana, 2 cs., £14.; Lyttleton, 4 cs., £10.; Wellington, 15 cs., £36.

MAGNESIA (CALCINED)—
Buenos Aires, 7 pkgs., £30.; Rio de Janeiro, 2 cs., £23.; Sydney, 2 cs., £13.

MAGNESIUM CARBONATE—
Bombay, 3 cs., £14.
Calcutta, 1 cs., £6.
Havana, 2 cs., £7.
Melbourne, 33 cs., £50.
Rio de Janeiro, 18 cs., £85.

MAGNESIUM CITRATE—
Barcelona, 20 cs., £300.; Gibraltar, 10 cs., £73.; Montreal, 1 cs., £8.; Vancouver, 3 cs., £18.

MAGNESIUM SULPHATE—
Accra, 3 c., £5.; Auckland, 10 c., £13.; Beira, 4 c., £5.; Beyrout, 13 c., £11.; Busreh, 4 c., £5.; Calcutta, 13 c., £35.; Cape Town, 4 c., £5.; Colombo, 1 t. 10 c., £26.; Delagoa Bay, 10 c., £13.; East London, 8 c., £9.; Fremantle, 35 c., £44.; Geraldton, 5 c., £6.; Jaffa, 5 c., £6.; Jamaica, 8 c., £6.; Karachi, 10 c., £12.; Lyttleton, 5 c., £6.; Madras, 6 c., £16.; Melbourne, 6 t. 17 c., £165.; Montreal, 2 t. 10 c., £30.; Mossel Bay, 10 c., £13.; New Plymouth, 10 t., £75.; Toronto, 10 c., £8.; Wellington, 1 t. 5 c., £29.

MANGANESE BORATE—
Paris, 12 c., £54.

MANGANESE HYDROXIDE—
Genoa, 4 cks., £56.

MERCURIALS (*otherwise undes.*)—
Calcutta, 3 pkgs., £71.
Jamaica, 1 cs. (pt.), £6.

MERCURY AMMONIUM CHLORIDE—
Sydney, 1 cs. (pt.), £7.

MERCURY BICHLORIDE—
Auckland, 1 cs., £8.

MERCURY CHLORIDE—
Havana, 1 cs. (pt.), £21.

MERCURY IODIDE—
Sydney, 1 cs., £134.

MERCURY OXIDE—
Rio de Janeiro, 1 cs. (pt.), £7.

METHYL SALICYLATE—
Bangkok (F.), 2 cs., £16.; East London (F.), 2 cs., £18.; Lyttleton (F.), 2 cs., £18.; Sydney, 2 drms., £28.

NICKEL SULPHATE—
Perth, 2 cs., £5.

NITRIC ACID—
Bagdad, 2 c., £8.; Colombo, 2 c., £7.; Madras, 4 c., £9.

PHOSPHORIC ACID—
Auckland, 6 cs., £18.; Calcutta, 1 cs., £5.; Cape Town, 1 cs., £6.; New Plymouth, 1 cs., £6.

PHOSPHORUS (AMORPHOUS)—
Talcahuano, 10 cs., £117.

POTASSIUM ACETATE—
Calcutta, 2 cs., £5.

POTASSIUM BICARBONATE—
Lyttleton, 2 kgs., £6.

POTASSIUM BROMIDE—
Sydney, 1 ck., 1 cs., £18.

POTASSIUM CITRATE—
Auckland, 2 cs., £27.; Bombay, 1 cs. (pt.), 3 cs., £49.; Brisbane, 2 cs., £15.; Sydney, 3 cs., £60.

POTASSIUM CYANIDE—
Auckland, 1 cs., £7.; Oruro, 5 cs., £71.; Townsville, 30 cs., £361.

POTASSIUM IODIDE—
Auckland, 1 cs. (pt.), £44.; Bangkok, 5 cs., £417.; Bombay, 1 cs., £88.; Brussels, 3 cs., £259.; Genoa, 6 cs., £374.; Jamaica, 3 cs. (pt.), £7.; Naples, 3 cs. (pt.), £86.; Sydney, 1 cs. (pt.), 1 cs., £111.

POTASSIUM METABISULPHITE
Dunedin, 4 kgs., £44.
Melbourne, 1 kg., £5.

POTASSIUM PERMANGANATE—
Sydney, 1 drm., £11.

POTASSIUM PRUSSIATE—
Alexandria, 3 cs. (pt.), £84.; Danzig, 25 cks., £530.; Melbourne 1 kg., 6 cks., £199.; Paris, 9 kgs., £155.

PRUSSIAN BLUE—
Amsterdam, 1 ck., £64.; Hamburg, 20 cks., £860.; Melbourne, 1 ck., £25.

ROCHELLE SALTS—
Hong Kong, 4 cs., £28.
Sydney, 2 c., £9; 1 ck., £5.

SALAMMONIAC—
Colombo, 5 kgs., £13.

SALICYLATES (*otherwise undes.*)—
Shanghai, 1 cs. (pt.), £7.

SALICYLIC ACID—
Auckland, 1 kg., £6.
Hong Kong, 1 cs., £22.

SALTPETRE—
Cape Town, 3 c., £6.; Copenhagen, 4 c., £22.; Durban, 9 c., £21.; Rio de Janeiro, 2 c., £7.; Santos, 2 t. 9 c., £98.

SHEEP DIP—
Delagoa Bay, 1 t. 2 c., £40.; Durban, 5 t., £212.; Panama, 4 c., £6.

SILVER NITRATE—
Fremantle, 1 cs., £29.
Hong Kong, 2 cs., £64.

SODA CRYSTALS—
Calcutta, 4 c., £5.
Mauritius, 1 t., £8.

SODIUM BENZOATE—
Madras, 4 c., £60
Rio de Janeiro, 2 cks. (pt.), £13.

SODIUM BICARBONATE—
Aden, 11 c., £32.; Alexandria, 1 c., £6.; Beyrout, 7 c., £11.; Cairns, 1 t., £13.; Calcutta, 1 t., £59.; Delagoa Bay, 10 c., £15.; Durban, 6 c., £7.; East London, 6 c., £8.; Fremantle, 10 c., £22.; Karachi, 2 c., £6.; Madras, 3 c., £10.; Manila, 1 c., £5.; Melbourne, 11 c., £16.; Mossel Bay, 4 c., £6.; Oruro, 1 t. 10 c., £51.; Shanghai, 2 t. 2 c., £27.; Townsville, 5 t., £49.

SODIUM BISULPHITE—
Copenhagen, 9 t., £180.
Sourabaya, 2 t., £38.

SODIUM BROMIDE—
Brisbane, 1 cs., £5.
Sydney, 1 cs., £8.

SODIUM CARBONATE—
Benkoelen, 8 c., £11.
Gothenburg, 4 c., £16.

SODIUM HYDROSULPHITE—
Paris, 1 c., £20.

SODIUM HYPOPHOSPHITE—
Amsterdam, 1 cs., £14.

SODIUM HYPOPHOSPHITE—
Barcelona, 5 cs., £112.
Genoa, 2 cs., £45.

SODIUM HYPOSULPHITE—
Madras, 6 c., £5.
Singapore, 2 c., £8.

SODIUM IODIDE—
Calcutta, 1 cs., £30.; Genoa, 3 cs., £295.; Naples, 3 cs. (pt.), £59.

SODIUM PERBORATE—
Bilbao, 10 c., £53.

SODIUM PHOSPHATE—
Calcutta (F.), 6 c., £16.

SODIUM PRUSSIATE—
Rio de Janeiro, 10 drms., £79.

SODIUM PYROPHOSPHATE—
Sydney, 15 c., £34.

SODIUM SALICYLATE—
Auckland, 1 kg., £14.; Sydney, (F.), 1 cs., £13.; Sydney, 1 ck., £15.; Wellington, 2 cs., £17.

SODIUM SALTS (*otherwise undes.*)
Dunedin, 5 c., £6.

SODIUM SULPHATE—
Auckland, 5 c., £7.; Beyrout, 12 c., £6.; Bilbao, 150 t., £844.; Demerara, 10 c., £7.; Hamburg, 10 t. 2 c., £120.; Mauritius, 1 t. 6 c., £26.; Wellington, 10 c., £5.

SODIUM SULPHIDE—
Bilbao, 3 t., £49.; Lyttleton, 4 t. 17 c., £58.; Wellington, 5 t. 13 c., £69.

SODIUM SULPHITE—
Dunedin, 10 c., £25.; Madras, 1 c., £5.; Melbourne, 3 t., £35.; Wellington, 2 t. 10 c., £64.

SODIUM TARTRATE—
Adelaide, 2 c., £7.
Calcutta, 1 c., £5.

SULPHUR—
Cape Town, 61 t. 8 c., £875.

SULPHUR (FLOWERS)—
Cape Town, 2 t. 5 c., £32.

SULPHURIC ACID—
Accra, 5 c., £19.; Beira, 2 t. £40.; Benkoelen, 1 cs., £14.; Channel Islands, 3 c., £6.; Colombo, 15 c., £26.; Calcutta, 6 c., £7.; Durban, 19 c., £44.; Gibraltar, 1 t. 1 c., £23.; Madras, 2 c., £6.; Pt. Said, 6 t., £111.; Pt. Sudan, 2 t. 7 c., £43.; Sekondi, 3 t. 8 c., £91.

TARTARIC ACID—
Aden, 2 c. (F.), £14.; Aden, 1 c., £5.; Calcutta, 4 c., £37.; Calcutta, 3 c. (F.), £29.; Durban, 12 c., £83.; Durban, 1 c. (F.), £5.; Delagoa Bay, 4 c., £39.; East London, 2 c., £17.; Hamburg, 1 t., £123.; Jamaica, 3 c., £24.; Karachi, 2 c., £19.; Mossel Bay, 3 c. (F.), £28.; Pt. Said, 1 c., £7.; Rangoon, 5 c., £32.; Singapore, 3 c. (F.), £19.; Vancouver, 10 c., £66.

THEOCINE SODIUM ACETATE—
Melbourne (F.), 1 cs. (pt.), £5.

TURPENTINE—
Durban, 3 drms., £13.
Melbourne, 7 cs., £53.

ZINC OXIDE—
Barcelona, 5 cs., £23.; Copenhagen, 60 cs., 340 cks., £1,319.; Calcutta, 1 cs., £11.; Hong Kong, 10 kgs., £25.; Ponta Delgada, 2 cks., £18.; Wellington, 13 pkgs., £31.

Week ending September 15.

ANTIMONY REGULUS—
Copenhagen, 10 c.

FULLER'S EARTH—
Barbados, 8 t.; Bombay, 10 t.; Montreal, 75 t.; New York, 63 t.; Treport, 1 t.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE WORK OF THE GOVERNMENT LABORATORY.

THE enormous amount of chemical control work entailed in the service of the various Government departments and in the efficient administration of many Acts of Parliament is well illustrated in the recently published annual report of the Government Laboratory. The total number of samples examined during the period April, 1922, to April, 1923, was 343,453, and this number is increasing at the rate of about 30,000 each successive year. The total increase has been reflected in every department of the Laboratory's activities with the exception of tea, the number of samples of which examined has shown a decrease of 5,500 from the previous year. The Safeguarding of Industries Act, the Dyestuffs (Import Regulation) Act, and the Dangerous Drugs Act have continued to impose considerable extra work on the Department. With regard to the first-mentioned Act, nearly 8,000 samples were examined during the course of the year, and many of these samples necessitated analyses of an exceedingly intricate nature. On the whole, the figures furnished in the report show that the number of rejections of inferior-quality materials, or of materials not up to the standard demanded by law, were surprisingly few, particularly in the case of foodstuffs. Only 22 samples of fertilisers found by the local authorities not to comply with the Fertilisers and Feeding Stuffs Act were examined, and in most of these cases the amounts of nitrogen, phosphates, or potash were found to be less than the guarantee stated. An interesting point arose under the Merchandise Marks Act, where 71 samples of blue vitriol, supplied for horticultural or wheat-dressing purposes, were investigated. In one case the material consisted of a mixture of copper sulphate and ferrous sulphate in approximately equal proportions, and the seller contended that such a mixture was properly described by the trade description, "Commercial blue vitriol." Legal proceedings ensued, however, and the findings negatived the contention of the seller. The point arose under the Merchandise Marks Act, when 71 attitude of the customs authorities in claiming the full rate of duty on ethyl alcohol contained in commercial formaldehyde is recalled by the practice of these same authorities in the case of fusel oil. This, whether home-produced or imported, generally contains ethyl alcohol as an unavoidable impurity, and duty is not charged unless upwards of 15 per cent. of proof spirit is present.

Where alcohol is found in greater proportion than 15 per cent. of proof spirit, the importer is allowed to reduce the alcohol content to the amount allowed. It is very difficult to understand why a similar line of action should not be adopted in the case of formaldehyde, since on the grounds of both potability and facility of recovery of the ethyl alcohol, formaldehyde presents a greater obstacle than fusel oil.

A NEW COMPOUND FERTILISER.

Details are available from France of a new compound fertiliser which, if all the claims made on its behalf are substantiated should prove a proposition worthy of investigation. The feeling is growing, and was given expression to quite recently by Mr. R. C. Taylor in a paper he read to the North of England Gas Managers' Association at Bridlington, that the future of ammonium sulphate is, in face of the growing competition of more highly concentrated nitrogenous fertilisers, by no means assured, and that more attention should be given to the conversion of gasworks' ammonia into more concentrated products. The new fertiliser, which is manufactured by the Compagnie de Saint-Gobain under the name of "Superam," is based upon the idea of neutralising the residual acidity of ordinary superphosphate with ammonia gas. The general process is by no means new, but all the methods that have been proposed hitherto have suffered from the disadvantage that in the presence of the ammonium sulphate formed, and of the calcium sulphate invariably present in commercial superphosphate, retrogradation of the phosphoric acid to the soil-insoluble condition has occurred, and thus the benefit accruing from the presence of the ammonium sulphate has been more than neutralised. The Saint-Gobain Company has found, however, that by utilising the ammonia gas in low concentration—say, 3 to 5 per cent. —and controlling carefully the temperature of the reaction, not only can the danger of retrogradation of the phosphoric acid be positively averted, but the resultant compound fertiliser is obtained in a perfectly dry and friable condition, and of a homogenity much greater than that of simple mixtures. From the economy standpoint the main advantage of the process would appear to be the great saving in the amount of acid used as compared with the direct manufacture of ammonium sulphate, an average saving of 48 per cent. of sulphuric acid is being claimed. This process is, of course, applicable only to special cases, the cost of carriage and handling of the superphosphate precluding its serious consideration in many plants.

PRIVATE OXYGEN PLANTS.

A few years ago the answer to the question of whether an individual consumer of oxygen to the extent of from 30,000 to 50,000 cubic feet per week, could instal his own plant and run it with substantial economy would have been a decided negative. Within the last two or three years, however, the improvements in the air liquefaction and fractionation process of oxygen production have been so marked that such a categorical denial can now no longer safely be given. In a recent issue of the *Gas Journal*, for example, Mr. O. Simonis, the managing director of Liquid Air, Ltd., points out that his firm alone has during the last few years put up in this country small private oxygen plants which produce well over 1,500,000 cubic feet of oxygen per week, and which save their owners, on the average, about 50 per cent., and in some few instances as much as 75 per cent. of their former oxygen bills. It is claimed also that such small private plants prove commercially efficient for so low a make of oxygen as 25,000 cubic feet per week, provided that the plant be run continuously and not intermittently during any one week. The greatest measure of economy is obtained, naturally, in those plants which are at a considerable distance from the nearest oxygen factory, and which are able to utilise the gas as formed, since the heavy charges for compression, cylinders, and carriage are all avoided. The essential features of the small-output plants made by the firm in question are the preliminary absorption of carbon dioxide from the ingoing air by means of caustic-soda solution at ordinary pressures, the use of either horizontal or vertical four-stage air compressors, and the erection of the rectifying column on the top of the liquefier. The price of commercial oxygen from the large works has fallen very considerably during the last twelve months, and there is every indication that rock-bottom prices have not yet been reached, but if the remarkable economy figures instanced by Mr. Simonis are borne out by further experience, it would certainly seem that the small plant is in many cases in no immediate danger of ceasing to become a profitable proposition.

THE NOBEL INDUSTRIES MEETING.

The satisfactory financial position of Nobel Industries, Ltd., was commented upon in detail by the chairman, Sir Harry McGowan, K.B.E., at the annual meeting on Friday last. The greater freedom of the country from industrial disputes during 1922, and the gradual improvement in trade during the year, were given as the main reasons for the ready sale of the products of the associated companies. The maintenance, and in many cases the improvement, of the qualities of these products were also contributory factors of no mean importance. The Chairman admitted that the opinion was prevalent amongst a number of consumers that prices, especially of explosives, detonators, and fuses, were rather high, and foreshadowed that the economies in production resultant upon the policy of concentration adopted by his enterprise would undoubtedly be reflected in lower-selling prices in the near future. It is encouraging to learn that the export trade of at least one large chemical manufacturing concern has shown considerable improvement during 1922. Sir Harry McGowan, in common with all the leaders of big industrial undertakings, realises that until a permanent settlement of the European reparations problem is effected, expectations of real trade stability is quite futile, and last months' Board of Trade Returns unfortunately show too clearly the present depressed state of our overseas trade.

THE MANUFACTURE OF ALUMINA.

PRODUCTION OF THE HYDROXIDE AND OXIDE.

By F. R. Lowe.

ALTHOUGH the metal aluminium is now in universal use it is remarkable that the literature dealing with its manufacture does not give much information regarding the first part of the process of winning the metal from its ores. It is proposed in this article to try and fill the omission.

Varieties of Bauxite Suitable.

Bauxite is the raw material now universally used for the manufacture of alumina $Al_2(OH)_6$ and its anhydrous form Al_2O_3. This material is found in all parts of the Globe, but all is not suitable for the extraction of alumina. Other materials, such as alunite, feldspar, etc., have been proposed, and in America alunite has been used, but generally the alumina is a by-product in these cases. Alumina made from china-clay by means of sulphuric acid and calcining is produced in the anhydrous form, and is not sufficiently pure for many purposes.

The composition and physical properties of bauxite vary considerably, the greatest variations being connected with the amount of iron and silica. The colour ranges from a light biscuit colour to a deep brown red, and the texture and hardness from a soft earthy structure to a massive rock-like structure. Irish bauxite is usually the poorest in alumina, and the French highest, although that from British Guiana and Georgia run it very close. The latter as usually mined contains 60-70 per cent. Al_2O_3 and from 3-25 per cent. Fe_2O_3, silica 3 to 9 per cent., and small amounts of vanadium, phosphorus, and titanium.

Indian bauxite is of quite a different structure, such as the laterites, its derivation being like that of British Guiana, due to tropical heat and humidity of the atmosphere. There is as a rule rather more organic matter present in the tropical ores than in those from colder climates.

Importance of the Free-Silica Content.

The physical condition affects the process working, and those ores which are moderately hard are much to be preferred. In fact, some of the softer earthy varieties cannot be economically worked, although their composition is all that can be desired. Chemically the worst constituent of the ore is silica in the free state. At one time titanium was thought to be deleterious, but this only applies to the Deville-Pickering process and not to the Baeyer process—really the wet process.

Two processes have been in use, the dry and wet or Baeyer process. Other processes have been proposed, such as electric fusion with coal, and the Peniakoff process, using sulphate of soda, but none is commercially employed. The object of both processes is to obtain the alumina in the soluble form as aluminate of soda.

Ore is first ground to a mesh of at least 80 and then mixed with the molecular equivalent of Na_2O, allowing for the amount of Na_2O which will combine with the free SiO_2, forming a sodium silicate, which in turn forms a complex sodium aluminium silicate partially soluble in the liquors and partly insoluble.

Bauxite is never used if it contains more than 3 per cent. of free SiO_2, since from 12 to 20 per cent. of the alumina content is thereby rendered unavailable and is lost, remaining in the residue for the dump. One part of SiO_2 fixes 0.61 part of Al_2O_3, and from this it will be seen that SiO_2 is deadly to economical extraction, consuming both alumina and the expensive soda.

In the dry process a proportion of the titanium is allowed for, but if it is in combination with iron nothing is to be feared. The small amounts of vanadium and phosphorus present in the ore consume soda, but are not taken into account as such. A figure based on actual practice is used as a factor.

Production and Decomposition of the Sodium Aluminate.

After the dry ore is mixed with (1) sodium carbonate, (2) caustic soda, in the correct proportions, it is conveyed to (1) furnaces or (2) autoclaves.

In the (1) fusion process the mixture is heated to about 1,000° C., and the CO_2 of the sodium carbonate is driven off and sodium aluminate formed. In the wet process the liquid mixture is heated with steam at 90-100lb. gauge pressure for about 8 hours, the temperature being raised as rapidly as possible to 150-160° C. In both processes the quicker the reaction temperature is reached the better the extraction as a whole.

Dealing with the dry process, the roasted product is lixiviated with water (usually condensed so as to prevent the further formation of insoluble aluminates), and care taken to prevent the undue access of CO_2. The liquors after clarification and containing the alumina as sodium aluminate are now ready for the precipitation of the aluminium hydroxide, either by the Baeyer method or by means of CO_2.

Turning back now to the wet process after the boiling of the mixed bauxite and caustic soda, the liquors are blown, under their own pressure, into diluting tanks, and there diluted to a gravity of 1.19 to 1.24, depending on the process conditions. The water used in the dilution is treated to precipitate the calcium and magnesium compounds, as the loss of alumina in the form of insoluble calcium and magnesium aluminates may amount to a large figure in the course of the year.

The two processes may now be treated as one up to the precipitation of the alumina, if the Baeyer process is used; but if the precipitation is by means of CO_2, separate treatment is necessary. The Baeyer process depends on an inherent property of sodium aluminate in solution to decompose spontaneously into aluminium hydroxide and caustic soda. The action is not reversible, nor is it complete, ceasing when the ratio of Na_2O to Al_2O_3 is as 6 : 1, the original being 2 : 1.

The liquors from the lixiviating or diluting tanks are now clarified, and the clear liquor, carefully kept free of suspended matter, is now run into decomposing tanks, where the above reaction takes place. The residue of red mud is taken to the dump. These tanks are large vertical cylinders fitted with stirring gear. The speed of the reaction and the physical condition of the hydroxide depend on a number of factors, such as temperature, concentration, speed of stirring, and volume of hydroxide initially present. The volume of hydroxide is usually found to be about 30/33 per cent. of the volume of liquor, and if the temperature is right and corresponds to the gravity, the precipitation of hydroxide is rapid and of a physical texture easy to filter.

Should these conditions not be present, then the rate of precipitation will be slow and the hydroxide of a slimy nature difficult to filter and settle. This upsets the process routine, besides causing other mechanical difficulties in the future handling of the residual liquors.

If the precipitation is by means of CO_2, extra plant in the way of CO_2 generators, coke or limestone, is required. An objection to the latter is the amount of residue that is left to handle, although if in a district where caustic is required the quicklime becomes a source of revenue. In this method precautions are taken to prevent, by correct strength of liquors and temperatures, the formation of a curious loose compound of sodium carbonate and hydroxide of alumina, and the formation of a slimy precipitate very difficult to filter. The precipitation of alumina in this process is of course complete, and therefore the liquors are concentrated direct and used over again as sodium carbonate.

In the above process it is obvious that once in the precipitating tanks no objection is taken to access of air. On the other hand, care is taken in the Baeyer process to prevent the undue access of air, to preclude as far as possible the carbonation of the liquors.

After the precipitation is completed the whole of the liquors in the dry process are filtered off, whilst in the Baeyer only so much as accompanies the amount of new hydroxide made is filtered. The remainder is settled, which under normal conditions is rapid and complete. The Baeyer hydroxide if properly made filters readily and contains 61/62 per cent. Al_2O_3. If badly made it contains, more water, soda and sodium aluminate. This hydroxide whilst moist usually has a salmon-pink colour due to the property which it possesses of absorbing colouring matter. The colour is derived from the ore by the action of the hot caustic on the organic matter present, the liquors usually resembling beer in colour.

Calcination of the Hydroxide.

Should the object be to make anhydrous alumina for aluminium manufacture, the hydroxide is now calcined in gas-fired furnaces. The temperature required to make a product suitable for the reduction furnaces is not less than 1,100° C., when an article having a density of at least 3.84 is obtained.

The calcination is not a simple matter. The type of furnaces in use is the result of careful observation and experiment. The thickness of the layer of hydroxide appears to influence in some undetermined manner the quality of the product, temperatures being equal. At densities of 3.4

to 3.75 the structure of the alumina is such that it runs like dry sand and is very dusty. At a density of 3.8 the change is very striking, the alumina lying heavy and practically dustless when moved about.

A small amount of calcium fluoride is added to the hydroxide before charging into the furnace (less than 1 per cent.), and this has the effect of considerably reducing the temperature at which the above change takes place, and so economises fuel. During the calcination a large amount of steam is evolved, and carries with it correspondingly large amounts of hydroxide and imperfectly-calcined alumina, which has to be collected in large dust chambers or mechanical dust collectors.

The question of alumina dust is a very important one, and continuous research into methods of alleviating the loss is carried out.

Recovery and Working-up of the Waste Liquors.

The working-up again of the liquors from the decomposers and hydroxide filter presses is obviously very important. Due to wash liquor and carbonation from the atmosphere the main body of the liquor suffers a reduction of gravity, and as the process is cyclic, this is a very important point with regard to concentration and proper circulation of liquors.

The concentration is usually carried out in vacuum evaporators, the final liquors having a gravity of 1.34 to 1.38. The act of concentrating also produces a partial purification of the liquors, sodium carbonate "salting-out" in the third pan with a further quantity in the storage tanks on cooling. This carbonate is causticised and added to the liquor going to the evaporators. The first effect acts also as a purifier, the tubes, tube plates and calandria body becoming covered with a very hard scale of sodium aluminium silicate, which is troublesome to get off, but which has to be removed.

Utilisation of the "Red-mud" Residues.

With regard to the residues of red mud, these are very troublesome to dispose of, and no use has yet been found for them. The high percentage of Fe_2O_3 which they contain (55-62) points the way to the blast furnaces for iron-making, but the ironmasters are afraid of the 5/6 per cent. of TiO_2, although in other parts of the world titaniferous ores are not looked upon with so much suspicion. They have also been proposed for use in gasworks, but the residue appears to act very inconsistently, and some method of making it more reliable for the absorption of H_2S must be found before gas engineers will take it. Needless to say, many experiments have been tried in co-operation with gasworks, but up to now success has not rewarded these efforts, although the experiments have not been concluded.

QUICKLIME FOR CAUSTICISING.

PROPOSED U.S. SPECIFICATION.

THE American Bureau of Standards (Circular No. 143), state:—The manufacture of caustic alkali consumes a large tonnage of quicklime annually. For this purpose a very pure grade of lime is required. Purity is determined not by the total content of calcium oxide, but rather by the content of calcium oxide which is available in the process for which the lime is used. A careful study of the requirements of the users of the quality of lime which is actually being used and of the possibilities of production have led to the establishment of 85 per cent. as a fair standard for available lime. Unlike most materials which are bought on specification, chemical lime is more valuable if it has a higher degree of purity than that required by the standard and less valuable if it has a lower degree. For this reason we have recommended that a bonus and penalty clause be inserted in the contract in order to take care of variations from the 85 per cent.

While the material is less valuable, but can still be used if the purity falls below the standard, there is a point reached eventually when the value of the material becomes such that it is poor economy to use the lime for this purpose. A careful survey of the situation has led us to set this figure at 70 per cent. In working up the details of this specification the Bureau has been assisted by an Interdepartmental Conference on Chemical Lime, composed of representatives of various Government agencies. The specifications have been partially approved by the National Lime Association, representing the producers, and by the Technical Association of the Pulp and Paper Industry, representing the largest group of consumers of this kind of lime.

THE AMINO-NAPHTHOL POLYSULPHONIC ACIDS.

By JOHN MISSENDEN.

FOR some considerable time these very complex acids have resisted attempts to determine their constitution, and, in some cases, their reactions, syntheses, and colour yields. From the disulphonic compounds given below a range of monazo- and disazo-dyestuffs have been produced:—

1 : 8 : 3 : 5 (B acid). 1 : 8 : (5) : ? (H acid).
1 : 8 : (2) : ? (L acid). 1 : 8 : 4 : 6 (K acid).
1 : 8 : 2 : 4 (S acid). 1 : 8 : 3 : 6 (B acid).

2 : 8 : 3 : 6 : (2R acid).

It is not proposed to discuss here more than the L acid, the 1 : 7 : (4) : ? position, and the 2 : 3 : 6 : 8 position of the disulphonic acids, and a few of the better known among the trisulphonic acids. So far as can be ascertained, none of these compounds appear even to a highly impure degree in the fractional distillation of coal tar; in consequence, their preparation is purely synthetic.

J. J. Müller and Co., of Basle, and later M. R. Knosp, of Stuttgart, believed that they separated some H-monosulphonic acid from a fraction heavy with naphthalene "salts," but found that the suspected compound was really a mixture caused by too low a temperature in the worm-tank and a tendency to "crust" in the lower end of the condenser-worm itself. On this occasion, a considerable quantity of the sulphuretted hydrogen passed through the worm instead of through the foul gas mains, and much of the fraction was rendered useless.

The Two Groups of Disulphonic Acids.

The information published in patent specifications upon the aminonaphthol sulphonic acids and their derivatives is exceedingly scanty. Descriptions of the reactions seem almost confined to their behaviour towards diazotised bases and nitrous acid. In the case of the 8 : 1 amino-naphthol described in a previous paper*, this substance is most suitable for the syntheses of many of the disulphonic acids, and those so formed divide into two groups—viz.:—

(1) Those giving para-azo-dyestuffs (they are purely the result of intensive research, and are not industrially useful);

(2) Those which give ortho-azo-dyestuffs in interaction with diazotised bases, as is evidenced in the cases of the B, H, and K acids.

Amino-Naphthol Disulphonic Acid L.

L Acid.—Two separate acids, the 1 : 8 : (2) : (5) — position, and the 1 : 8 : (2) : ? — position have been named "L acid." The first position is the one generally accepted as L acid, but many firms still use the term for the second. Dr. H. Brunck, of Ludwigshafen, declared in 1912 that the two compounds were identical, but an examination into their respective industrial uses shows this not to be so. In the first place, when acted upon by ferric chloride the acids show brown and green colourations respectively. Although the brown colour is fast to sunlight and to the action of most common washing soaps, it fades slightly under dry-cleaning processes, and is thus not a commercial dyestuff. The green is not so bad, indeed it might form a fairly useful bright lake with sodium acetate combinations. Care should be taken, however, accurately to regulate the acid and alkali, in order that neutrality may be obtained precisely at the moment when formation is in progress; otherwise, an excess of alkali will produce a dirty shade. The quantities of the raw materials used in the preparation in parts by weight were: Aluminium sulphate, 10; ferric chloride, 3.5; soda ash, 5; L acid, 3.5; sodium acetate, 3; caustic lye, 2; and hydrochloric acid, 4.

Both of the isomerides give yellow diazo compounds, and also couple with diazotised bases in acid solutions. (*References*: *Ger. Pats.*, Casella, 73,048 and 84,952; *Brit. Pat.*, Fischesser, 13,203/1894).

Other Disulphonic Acids.

The 1 : 7 : (4) : ? — acid (also known as 8 : 2 : (5) : ?) may be best produced by heating a reduced solution

* See article, "The Amino-Naphthols," by J. Missenden and F. E. Liechti, in *The Chemical Trade Journal and Chemical Engineer*, July 13, 1923, page 35.

of 8-nitro-2-naphthol, hydrochloric acid, and stannous chloride to 100° C. with concentrated sulphuric acid. The only information published by the patentee is that the acid is readily soluble. There are several colour reactions, however, the most noteworthy being the formation of a "viridine" green in interaction with ferric chloride, and subsequent treatment with alkali. The colour is peculiarly fast to light, and a wide range of shades may be obtained by mixing with quinoline yellow. The azo-dyestuffs resemble greatly those from K acid, but there is only one series. Little descriptive data concerning this series are to hand, but they are sufficient to warrant the belief that the dyestuffs are not commercially profitable. (*References*: *Ger. Pats.*, Casella, 69,458 and 75,066).

Unprecedented difficulties have been presented in the fixation of the final position, owing to a very complex constitution. The true constitution, however, believed to have been obtained during fission with cold fuming nitric acid, is probably 1 : 7 : (4) : (6).

The 2 : 3 : 6 : 8 — acid (also 3 : 2 : 5 : 7) has not had any description published by the patentee beyond the fact that it is produced by the sulphonation of 2-amino-3-naphthol-6-sulphonic acid. Investigation shows that the acid is fairly soluble, the acid sodium salt is obtained in needles, and is moderately soluble, the acid barium salt sparingly soluble, the calcium salt sparingly soluble, and it is possible to produce an acyl derivative which, upon coupling with diazotised bases, forms unstable azo dyestuffs pale yellow in colour. With ferric chloride a pale bluish green has been formed which is hardly suited to commercial requirements.

The Imperfectly Investigated Trisulphonic Acids.

There are only three of these acids that have been investigated with any degree of accuracy; they are the 1 : 2 : 3 : 6 : 8 —, the 2 : 1 : 3 : 6 : 8 —, and the 1 : 8 : 2 : 4 : 6 — positions. The first is obtained by reducing the azo-derivatives of the corresponding 2-naphthol-3 : 6 : 8 — trisulphonic acid; the second, by the same procedure, using the *a*-naphthol; and the third, by fusing naphthasultam — 2 : 4 : 6 — trisulphonic acid with 85 per cent. of caustic potash at 150° C. The first two do not give any salts worthy of mention.

The third compound forms salts sparingly soluble, such as the calcium, sodium, and potassium derivatives. Treatment with ferric chloride gives a green which can be made very bright, providing absence of alkalis is ensured. A very beautiful orange may be produced, which is highly soluble. Care should be taken in this case that every trace of free mineral acid is removed from the solutions, otherwise diazotisation will not take place; instead, there will be a rapid oxidation to the corresponding—naphthaquinone—trisulphonic acid. Oxalic acid is said to be best suited for the purpose of acting on the nitrite for diazotisation. The presence of cupric, ferric, mercuric, manganese, or nickel salts impair the brightness of the orange, but salts of the alkaline earth metals tend to intensify it. A most rich colouration can be obtained by the use of a calcined soda and barium chloride mixture in the ratio of 3 : 2, additional substances being Turkey-red oil and para nitraniline dissolved in very weak hydrochloric acid. Diazotisation should take place with sodium nitrite, and a splendid precipitated lake may be obtained. *References*: *Ger. Pats.*, Geigy, 171,024; Bayer, 84,597. *Brit. Pat.*, Geigy, 10,235/1904.

The Manufacture of Ether. — According to a *J.S.C.I.* abstract of a paper by J. B. Senderens (*Comptes rend.*, 1923, 177, 15), in preparing ether by running alcohol into sulphuric acid kept at 130° C., use is being made of a poor dehydrating agent—viz., the hydrate, $H_2SO_4,4H_2O$. At 140°, ethylene formation begins, but at 136°—138° etherification is more rapid than at 130°, since the highest hydrate capable of existence is then $H_2SO_4,3H_2O$. In practice it is more advantageous to supply an ether still with 95 per cent. alcohol containing 10 per cent. of concentrated sulphuric acid than to supply it with alcohol alone. Methyl ether is best prepared by heating methyl alcohol at 160°—165° with an acid corresponding to $H_2SO_4,2H_2O$. If sulphuric acid is used more dilute than corresponds to $H_2SO_4,4H_2O$, no conversion of methyl alcohol to ether occurs.

HYDROGENATED PHENOLS AND CRESOLS.*

THEIR USE IN SOAPS AND FOR GENERAL TEXTILE PURPOSES.

(*Continued from page 305.*)

IT is possible, however, that the hexalin and methyl-hexalin soaps will find a great field of application not only in textile manufacturing, but in laundry and general household work. Schrauth (*loc. cit.*) gives an account of experiments that have been carried out at the German Textile Technical College at Aachen. Materials made both of pure white wool and of dyed wool were rubbed well over with fat containing a good proportion of mineral oil. After washing with the hexalin soap the materials were obtained quite clear and oil-free.

Odour Not Found Objectionable.

In the use of hexalin and methyl-hexalin soaps in the fulling mill or in the washing machine, provided the temperature is not too high and the percentage of hydrogenation product in the soap is not too great, no deleterious effects on the health of the workpeople have been noted, and no objections have been raised against the odour of the soaps. For the preparation of solid household soaps, Bergo (*Seifensied. Ztng.*, 1922; No. 23) recommends mixing a considerable proportion of dekalin (decahydronaphthalene), which, in addition to its excellent fat solvent action, partially hides the odour of the hexalin or methyl hexalin. It is doubtful, however, whether the advantages claimed for the addition of dekalin are not more than outweighed by the increased possibility of fire accompanying its use.

Liquid hexalin and methyl-hexalin soaps now appear on the market under various trade names, such as Savonade, Texapon, Texalin, Hydralin, etc., and may contain in addition to hexalin, turpentine, tetralin (tetra-hydronaphthalene), benzine, benzol, carbon tetrachloride, and other chlorhydrocarbons. On dilution with water they give either clear solutions or permanent emulsions, both of which types possess excellent de-fatting and detergent properties.

Use in Special Oil Products.

A further use for hexalin and methyl hexalin is in the preparation of special oil products for the textile industry. These have been described in detail by Welwart (*Seifensied. Ztng.*, 1922; No. 36). For a good many years now, a series of water-soluble defatting materials, such as Tetrapol, Tetraisol, Lanapol, Verapol, etc., have been used in the textile industry. In general these materials are prepared by neutralising with alkali a mixture of the sulphonation products of castor oil or its fatty acids in the presence of water, hydrocarbons, chlorhydrocarbons, and sometimes in the additional presence of olein. Whilst the alkali salts of the ordinary fatty acids possess only a very slight solvent power for hydrocarbons and chlorhydrocarbons, the products described above possess, owing doubtlessly to the sulphonic group in the ricinoleic chain, a very considerable solvent power, which, in the presence of soaps is increased even more.

The solvent and emulsifying powers of the neutralised castor-oil sulphonation products are increased still further by a certain amount of polymerisation such as takes place in the preparation of monopol soaps, monopol oils, turkey-red oils, and iso soaps. Neutralised mixtures of monopol soap and olein can dissolve 20 to 25 per cent. of mineral oils, and the resultant mixture is perfectly soluble in water. Similar oil preparations which find application as wool fats, or as brightening materials in cotton and wool dyeing, can also be prepared simply by the use of hexalin or methyl hexalin. Emulsions of hexalin soaps and mineral oils, containing 60 per cent. or over of the latter constituent, when used with lukewarm water will completely cleanse woollen material that has been impregnated with fatty matter and mineral oil, even though such material has been allowed to remain in this state for many weeks. The use of small amounts of hexalin soaps will remove traces of mineral oils from a woollen fabric in a few minutes at the ordinary temperature.

Use in Silk Degumming and Dry Cleaning.

Welwart (*Seifensied. Ztng.*, 1922; No. 29) recommends the use of hexalin soaps as an addition to the soap bath in the degumming of silk, since they suppress the hydrolysis of the

* A Report by Ing. Chem. Welwark, of Vienna. Translated and rearranged from the *Chemiker Zeitung*, Sept. 3, 1923.

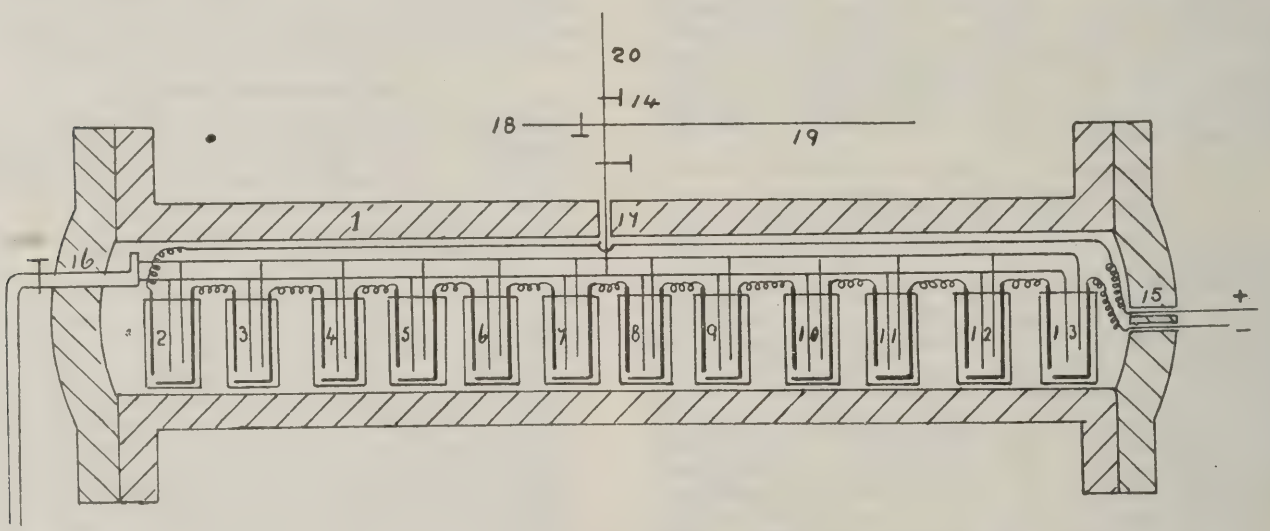
ordinary soaps, and thus minimise the formation of insoluble alkaline earth soaps. Liquid hexalin soaps can also be employed advantageously as additives to the bucking lyes and as mordanting oils. In chemical dry cleaning, as substitutes for benzine soaps, and as efficient stain removers for all classes of textiles, the hexalin and methyl-hexalin soaps may usefully be used.

These new soaps must not be valued merely on their fatty-acid content, since the presence of the hydrogenated phenols increases their detergent powers to a degree many times that possessed by ordinary soaps with a similar fatty-acid content.

A NOVEL BELGIAN NITROGEN-FIXATION PROCESS.

FORMATION OF AMMONIA IN AQUEOUS SOLUTION.

IN our issue of August 31, we printed a letter from J. J. Van der Bossche, chemical engineer of Courtrai, Belgium, in which the writer pointed out the similarity between the process of nitrogen fixation invented by himself and the hydrolytic nitrogen decomposition method investigated by the American workers Falk and McKee, and dealt with in our issue of August 17. In our comment on M. Van der Bossche's letter we stated that although the two methods were not strictly comparable, yet the Belgian process presented so many points of novelty and interest that a more detailed description of it would be given in a subsequent issue. The following account is from M. Van der Bossche's Belgian patent specification. We have since received from the inventor a description and sketch of a plant suitable for making ammonium sulphate and ammonium nitrate according to this process.



Electrolytic Hydrogen Evolved in a Pressure Vessel.

The aim of the inventor is to accomplish the synthesis of ammonia in the cheapest and most efficient manner. The method starts from the fact that by the electrolysis of any aqueous solution of an electrolyte, hydrogen is produced at the cathode at a pressure which, at the moment of liberation of the gas, is sufficiently great to enable the hydrogen to combine with nitrogen dissolved under pressure in the electrolyte. One kilogramme molecule of hydrogen at the moment of its liberation by electrolysis occupies a volume of 18 cubic metres, and if it is desired to keep this volume at 18 cubic metres a pressure must be applied above the electrolyte of about 1,222 kilogrammes per cubic metre. It is thus seen that at the instant of liberation of the hydrogen, there is a hyperpressure of more than 1,200 atmospheres. The higher the temperature of the electrolyte, the greater will be this pressure.

Influence of Catalysts.

If these hydrogen ions liberated at these hyperpressures come into immediate contact near the cathode with ions of nitrogen dissolved in the electrolytic liquid, combination to form ammonia can take place in the presence of a catalyst. It has been found that the catalytic action exerted by manganese dioxide placed at the bottom of the electrolytic cell is sufficient to cause ammonia formation, even in the presence of catalyst poisons such as sulphur, cyanogen, etc. By using cathodes and anodes of ferro-manganese (80 per cent.) the optimum conditions for the synthesis are realised since electrodes of this material destroy the catalyst poisons. If, in addition, the electrolyte also contains in solution a reducing salt such as manganese sulphite, or ammonium sulphite or sulphurous acid itself, this salt will be oxidised to manganese sulphate, ammonium sulphate or sulphuric acid respectively, particularly in the neighbourhood of the anode.

It results therefore that the electrolysis of a solution of this type containing nitrogen dissolved under pressure can be accomplished without the evolution of any gas whatsoever. The ammonia synthesised will combine with the sulphuric acid formed by the oxidation of the sulphurous acid or will precipitate the manganese hydroxide from the manganese sulphate, etc.

Description of Plant.

To put the invention into execution, the operation can be carried out in the manner indicated schematically in the accompanying illustration. In the pressure vessel 1, are placed a series of electrolytic cells, 2 to 13, arranged either in electrical series or in parallel. At the bottom of each cell is placed a quantity of small-lumped pyrolusite with a normal content of silica. It has been found that the presence of this silica facilitates the process in some unexplained manner. The anodes and cathodes are made of ferro-manganese and the electrolyte is composed of ammonium sulphate, manganese sulphate, ammonium sulphite, manganese sulphite, ammonium hydrosulphite or carbonate, sulphurous acid, hydrogen sulphide, cyanides and sulphuric acid, all in solution in water and proceeding partially from the actions which take place in the cell under the action of the electric current. The electrolyte also contains a small amount of ammonium silicate.

The nitrogen under pressure is introduced into the pressure vessel, through a pipe ending at 16 and constructed in such a manner as to resist a variable pressure. A series of pipes branching out from the main nitrogen pipe deliver the gas to the bottom of the electrolytic cells where the nitrogen owing to the general pressure in the system dissolves in the liquor, any excess of the gas being trapped and stored in the free space above and around the sides of the cells.

A second system of piping entering the main vessel at 17, after having passed through the four-way valve 14, introduces intermittently the liquor prepared for the electrolysis. Such a liquor is prepared in any suitable installation and reaches the four-way valve through the pipe 19. The spent electrolyte is forced out of the pressure vessel by means of the nitrogen through the pipe 18. Pipe 20 is a cleansing pipe for forcing out slime and gas. The liquors leaving by pipe 18 are submitted to any appropriate treatment, such as distillation, concentration, evaporation, or crystallisation,

and the resultant mother liquors are utilised for the preparation of fresh electrolytic liquor to be introduced through pipe 19. The anode may be constructed of a ferro-manganese plate of large surface on which the pyrolusite rests, and the cathode is preferably a ferro-manganese rod of comparatively small superficial area. The electrical pressure at the terminals may vary from 4 to 8 volts, according to the degree of concentration of the liquors, the pressure of the nitrogen, and the temperature of the cells.

PUMPS FOR INDUSTRIAL PURPOSES.*

FACTORS INFLUENCING CHOICE.

THE pump is a vital part of many industrial processes, and yet there is probably no piece of equipment which is purchased with so little consideration as to its application. There are an almost infinite number of combinations of mechanical elements which can be assembled into a pump design. It therefore becomes possible, by marshalling such elements properly, to build a pump which will meet an industrial problem more satisfactorily than "just a pump."

Of the many types of pumps available, such as are of industrial interest can, in a general way, be placed in four groups—namely, piston, plunger, centrifugal, and rotary. There are, however, many variations in design and construction in each group.

If a fluid has the consistency of water or is no more viscous than light motor oil, then a centrifugal pump can be applied with success. Whether the centrifugal pump should be of the single- or double-suction type, or equipped with open or enclosed impellers, depends upon circumstances surrounding the installation, such as volume in gallons per minute, head in feet, and the method available for driving the pump. In general, it can be stated that for large volumes at low head, a single-suction open impeller type pump is usually satisfactory; while for high heads, the double-suction, enclosed, impeller type centrifugal pump is more efficient.

A small volume, say 50gals. per min., and a high head, 50lb. to 75lb. per sq. in., is a combination of conditions which can be better met with a piston or plunger type pump than a centrifugal, unless there is some very special reason why a centrifugal pump should be considered. Such a reason might be found in passing certain kinds of fluids through filter presses, because the centrifugal pump has the advantage of delivering a steady flow without any pulsations or shocks through the filter medium. It also has the advantage that, as the filter becomes clogged, the rate of flow will automatically adjust itself to the increased filter resistance, and no undue pressure will accumulate on the filter, with the possibility of rupturing the cells or the filter itself.

A plunger pump will deliver a relatively small volume of fluid against a high head more economically than either a centrifugal or a rotary pump. A rotary or plunger type pump will handle viscous materials which would be impossible with a centrifugal. A rotary pump designed for the purpose will handle materials which are too viscous for either a plunger or piston type pump (materials like white-lead paste, etc.). It must, however, be borne in mind that such materials cannot be handled by an ordinary rotary pump. It must be designed for the purpose in order to assure success.

The fact must not be lost sight of that there is no universal rotary pump. In fact, there is no universal pump of any type. It follows that each type or design of pump is limited to certain uses. These limitations are governed by a variety of conditions, but, fundamentally, the viscosity, temperature, volume, head, and chemical properties of the fluid are most important.

Effect of Viscosity of Fluid.

When using the term "fluid," every substance is included which is plastic enough to permit it to flow through a pipe—for example, commercial white lead and oil, cereal mash, chilled lard, tooth paste, paper pulp, pitch, tar and asphalt, chocolate paste, glucose, molasses, etc.

Good practice would dictate that viscous materials must either gravitate or be fed to the pump inlet. Such materials do not respond readily to suction lifts, as they have a high coefficient of friction; therefore, one must avoid trying to impart an excessive velocity of flow to them through any part of the pumping system. A pumping system here refers to the whole equipment from the source of supply to the point of discharge, including the vessel, agitator, or equivalent in which the source of supply originates, and the container into which it is to be delivered. If a paste or viscous material can attain a normal (efficient) velocity of 0.5ft. per sec., the pumping system should be so arranged that in no part of it a greater velocity is attempted than the ideal condition would include, not even through the pump, its ports or valves. Thus, a 3in. pump might efficiently handle 300gals. per min. of a fluid of low viscosity, and yet not more than 10gals. per min. could be successfully handled when the material is highly viscous.

A pump speed or capacity must be synchronised with the fluid's economical flowing capacity; and all pipes and fittings used in the pumping system must also be of such sizes to accommodate the economical flowing capacity of the material pumped. If a pump has a capacity too large for the normal rate at which a viscous fluid will flow, there will be a tendency to "wire-draw" the fluid in the suction pipe and set up a high vacuum in the same. This will result in having the pump's displacement only partly filled and under vacuum, causing shocks and setting up serious vibration and noise in piston, plunger, or rotary type pumps.

A Perfect Vacuum Unnecessary.

Too few people realise that even if a pump were able to produce a perfect vacuum on the suction side, the head pressure forcing the fluid to the pump would only be equal to that of the atmosphere, provided the source of supply was on the same level as the inlet to the pump. It would be considerably less, however, with a vertical suction lift, and as much less as the static head resulting from a lift below the level of the pump inlet.

A practical example might be suggested by assuming 100ft. of straight 1in. pipe connected to the discharge of a pump. This line of pipe would require a head equal to approximately 12lb. per sq. in. to force water at the rate of 20gals. per min. through it, because the velocity set up in the pipe requires this pressure to overcome the frictional resistance.

Should it be required of a pump to draw water to the inlet, a vacuum of approximately 25in. would have to be created by the pump to cause a flow of 20gals. per min. through a 1in. straight pipe 100ft. long. If the water were warm or saturated with air, it is obvious that such a vacuum could not be maintained, and thus the capacity would be less. If the suction pipe-line were longer, the rate of flow could not be established, because of the increased friction resulting. It follows that the pump cylinder would then only be partly filled with water, while the balance of the space would be under vacuum. Such a condition would cause shock within the pump as well as the pipe-line, resulting in noise and vibration which might cause serious difficulty.

Where Mechanical Efficiency Must be Sacrificed.

Efficiency is always an important item to be considered in the selection of pumps or any other equipment, but the meaning of efficiency must be applied in its broadest sense—that is, the ultimate efficiency as related to other equipment in the process or plant—namely, freedom of interruptions, etc. A pump may have a very high mechanical efficiency in itself and yet be the cause of great inefficiency in the plant or process as a whole; while a pump of low mechanical efficiency may bring up the plant efficiency to an exceedingly high level. Some concrete experiences will illustrate this statement.

In a plant handling liquid foodstuffs an excellently made and efficient pump was used, and would have been correctly applied if the fluid had been of a kind where the element of cleanliness was not important. But the pump was of such construction that accessibility to the interior, ports, etc., was impossible, thus permitting the breeding of bacteria, which seriously impaired the flavour and quality of the product. The difficulty was overcome by building a special type of open impeller centrifugal pump, in which the features making for higher efficiency had to be sacrificed in favour of obtaining the essential sanitary features. Thus, a higher efficiency was established within the plant by the application of a pump of lower efficiency, but sanitary in construction.

In a certain chemical industry in which a great many pumps were installed, continual interruptions were experienced because a standard open impeller type pump had to be used; and since the service was continuous, some of these pumps would wear out within from four days to a week. The material to be handled was not only of an acid nature,

* Abstract of paper by W. F. Traudt, of the Taber Pump Co., Buffalo, N.Y., in *Industrial and Engineering Chemistry*, Sept., 1923.

but held in suspension materials which were highly abrasive. The pumps were operated at the most efficient speeds considered strictly from a hydraulic standpoint. The pressure heads were relatively high, and required high speeds to obtain good mechanical efficiency. The writer was consulted on the matter, and advised that improvement could only be obtained by using larger pumps and operating them at slower speeds, which in some instances reduced the mechanical efficiency of the pump unit to half, with the result that shutdowns and interruptions were reduced. Thus the total plant efficiency was improved.

In one case, with a pump which had to be replaced every week, the time was extended to a month's operation before repairs or replacements had to be made; and in another instance, by changing the alloy from which the pump was made, the service was extended from five weeks to eleven months.

If the subject of pumping fluids is given a little earnest thought, it is amazing to find how dependent upon some form of pumping operation the world is. A syphon is a pump. Capillarity is a form of pumping, and is frequently the only means by which line shafts are lubricated. Vegetation itself depends upon the pumping operation such as is accomplished through the rootlets of trees conveying moisture to the smallest twig and leaf. In short, any process which will cause a fluid to be raised from one point to another at the same or higher level can be considered a pumping system. It follows, therefore, that if one will consider industrial pumping problems with more care, and examine into all phases of the proposed pumping system, never losing sight of the physical and chemical properties of the fluid to be handled, there will result incalculable savings not only in fuel or power, but through fewer interruptions in manufacturing processes. Too often, when laying out an industrial process, one thinks of the pump at the "eleventh hour," and then only in terms of "just a pump."

HYDROFLUOSILICIC ACID.

NEW USES AND PROPERTIES.

ACCORDING to C. A. Jacobson (*Bull., Internl. de l'Académie Polonaise des Sciences*, 1922, p. 9) the uses of hydrofluosilicic acid are rapidly increasing. A solution of 28-30 per cent. strength is sold in America as a disinfectant and for the destruction of fungi. The acid will convert starch into soluble starch at temperatures below 100° C. Its use has been proposed in the paper industry for the hardening of paper. Calcium fluosilicate is stated to give good results when applied as a fertiliser for cereals. Fluosilicates are also used in the cement and linoleum industries. The acid itself may be used for the precipitation of potash in molasses.

Systematic examination of the nature of hydrofluosilicic acid has given the following results:—Slow distillation *in vacuo* at ordinary temperatures of the aqueous acid has allowed the concentration to be pushed up to 60 per cent., and this figure appears to be maximum attainable at normal temperatures. It is very probable that hydrofluosilicic acid does not exist in the gaseous state and cannot be distilled as such. The density of a 60.79 per cent. H_2SiF_6 has been found to be 1.4634 at 25° C., and the index of refraction at the same temperature is 1.3465. In concentrated solutions the acid possesses a biting taste, but in dilute solution its taste resembles that of alum.

For the estimation of hydrofluosilicic acid, the author recommends the following process:—Sodium or potassium chloride is added to a determined volume of the acid and the titration effected in two steps, firstly at a low temperature with normal caustic soda or caustic potash and in the presence of methyl orange, and secondly in more dilute solution in the neighbourhood of the boiling point and in the presence of phenol phthalein. The hydrofluosilicic acid investigated was prepared by the author by decomposing a mixture of fluorspar and precipitated silica with sulphuric acid and absorbing the silicon tetrafluoride evolved, in water. Ortho-silicic acid is formed at the same time as the hydrofluosilicic acid and the reaction only takes place in aqueous solution.—*La Revue des Produits Chimiques.*

German Patent Regulations.—Germany has increased the fees for registration of trade-marks and patents and has extended the terms of patents from fifteen to eighteen years.

NATIONAL GAS EXHIBITION.

SCIENTIFIC PAPERS READ AT BIRMINGHAM.

A JOINT meeting of the Society of Chemical Industry (Birmingham and Midland Section) and the Midland Junior Gas Association was held at the National Gas Exhibition, Birmingham, on Tuesday last. The papers read were "Specific Heat of Coal and Relation to Its Composition," by Mr. G. Coles (Mining Research Laboratory, University of Birmingham); "A New Gas-fired Combustion Furnace," by Mr. T. J. Hedley (Department of Chemistry, University of Birmingham); and "Improvements in Nett Value Calorimetry," with a description of an automatic device for temperature and pressure correction by Mr. C. H. Beasley.

A New Gas-combustion Furnace.

In this paper Mr. Hedley pointed out that gas-combustion furnaces are used in chemistry for the ultimate analysis of organic substances. Existing types of furnaces represent little or no advance in design or efficiency over those in use over half a century ago and are usually expensive, heavy and cumbrous, easily get out of order and are very wasteful of gas, time, and human energy. The new furnace is readily portable by one person, costs considerably less than any other furnace, is economical of gas and can be operated with precision and comfort. The essential features are a multiple flame burner with separate control of each flame, gas being admitted at each end of the burner (which is partitioned at the centre) by a series of jet holes, the number in use being controlled by a screw plunger. The burner is self-regulating as regards air-gas mixture, the air intake by induced draught being governed by the number of jets in use. By this means any type of flame can be obtained for any number of flames, the number of flame orifices open being varied from the front underneath the burner by simple heat screened thumb-screw valves. Adequate provision is made for the protection of the operator, the bench and the bungs of the combustion tube, by suitable hinged and fixed refractory screens.

These furnaces are in daily use in Universities and colleges at Birmingham, Edinburgh, Leeds, Liverpool, etc., and are made and supplied by Messrs. W. and J. George, Ltd., Birmingham.

An Improved Automatic Gas Calorimeter.

The subject of calorimetry, stated Mr. Beasley, is now engaging a good deal of attention both from gas manufacturers and consumers, and it is interesting to note the improvements in calorimetric apparatus. The Beasley Recorder has had some very important improvements effected in its design, chiefly relating to the gas measuring part of the apparatus. The meter water line is now kept to a constant level by a small storage tank holding enough water to keep the meter correctly lined for several days without attention. With regard to correcting the volume of gas to standard conditions, by a very simple device the pendulum rate of oscillation can be automatically varied in direct proportion to the alteration of volume of the gas passing through the meter, owing to temperature and pressure conditions. The main novelty about the device is what one may call a brake in the form of a flat steel spring that is used to oppose the motion of the pendulum on the constant flow meter.

The movements obtained by changes of pressure are closely proportional to the magnitude of these changes, so that the brake spring moves distances proportional to the pressure changes. It was found by experiment that if a brake in the form of a flat steel spring could be applied to oppose the motion of the pendulum in such a way that the opposition force itself is a constant amount, then by applying this brake at different points from the fulcrum or suspension point, the rate of the pendulum varied in direct proportion to these distances. These conditions are complied with in the apparatus now in use. A feature about the corrector is that its movements are practically free from friction, the arm turning on pointed pivots and the stud at the end of the spring only coming in contact with the slot at the end of pendulum beat.

The meter without the corrector delivers a constant volume of gas irrespective of pressure, temperature and density, but with the corrector it delivers a constant amount, that is if the volume passed at any temperature and pressure is corrected to standard conditions, at which gas rate the instrument is calibrated.

THE WORK OF THE GOVERNMENT LABORATORY.

REPORT OF CHIEF CHEMIST FOR 1922-1923.

THE report of the Government Chemist upon the work of the Government Laboratory for the year ending March 31, 1923, has just been published by H.M. Stationery Office (price, 1s. 3d. net). The following extracts are taken from this report.

The chemical work of the following departments is performed wholly or in part in the Government Laboratories —Admiralty, Ministry of Agriculture and Fisheries, Air Ministry, Colonial Office and Crown Agents for Colonies, Board of Customs and Excise, Geological Survey, Ministry of Health, Board of Inland Revenue, Ministry of Pensions, Post Office, Department of Scientific and Industrial Research, Home Office, Board of Trade, War Office, Office of Woods and Forests, and Office of Works.

The total number of samples examined in the course of the year is 343,453, as compared with 302,562 in the preceding year, an increase of 40,891. The samples of wine have increased from 61,683 to 85,776, of sugar from 42,715 to 49,172, and of tobacco offal and waste from 31,851 to 35,545, while there are notable increases in the numbers of samples of wort and exported and imported spirituous preparations. The number of samples of beer for the detection of dilution is again high, the number being 5,079, as compared with 4,650 in the previous year and 854 two years ago. There has been a decrease of 5,500 in the number of samples of tea. In connection with the Safeguarding of Industries Act the number of samples in the present year is nearly 8,000. The Dangerous Drugs Act, and the Dyestuffs (Import Regulation) Act, continue to impose considerable work on the Department.

Investigation of Sheep Dips.

The regulations of the Ministry of Agriculture require the periodical dipping of sheep in a bath prepared from a dip which has received the approval of the Ministry. In applying for the approval of a dip, the manufacturer submits a sample, together with a formula according to which the dip has been prepared, and both formula and dip are forwarded to the Government Laboratory. In some cases the formula shows that the dip made as prescribed, or the bath prepared at the dilution proposed, would not contain a sufficient quantity of active ingredients (arsenic, tar acids, nicotine, sulphur) to be considered effective for the cure of sheep scab. In such cases the formula is returned to the makers for amendment. Where the formula is satisfactory the dip is analysed to ascertain whether it has been made according to the formula. Samples of the dips as sold for use, as well as samples of the bath in use during a dipping operation, are also occasionally examined to ensure that dip and bath are of the approved strength. 189 samples were submitted during the year, and 27 were reported as defective.

Pollution of Rivers by Tar Drainage.

Ninety-eight samples of river water and effluents were investigated. In order to ascertain whether bituminous road dressings would give drainage harmful to fish life, a committee of the Ministry of Agriculture and Fisheries was set up to deal with the matter, and a representative of the Government Laboratory served on that body. Experiments carried out showed that pure bitumens were free from tar acids and bases and did not contain toxic ingredients likely to be dissolved in road drainage. From this point of view bituminous road dressings would appear to be reasonably free from risk to fishing streams. The matter was investigated at a site at Alresford on the road previously used for testing tarred surfaces. A report (No. 40 of Standing Committee on Rivers Pollution, Ministry of Agriculture and Fisheries) dealing with these experiments has now been issued, and it is shown that in the conditions stated no toxic effects resulted from the bituminous road dressing.

Fertilisers and Feeding Stuffs.

The Fertilisers and Feeding Stuffs Act is administered by local authorities, but before any of these bodies can take proceedings against a seller for contravention of the Act, the consent of the Ministry of Agriculture must be obtained. Such consent can be given only after the portion of the original sample taken and reserved for the purpose has been analysed at this laboratory and reported upon to the Ministry. During the year, 22 fertilisers, including one from Scotland, and 22 feeding stuffs have been reported upon. In most cases the amount of nitrogen, phosphates or potash was less than the guarantee stated. Seven samples of basic slag and basic phosphate were deficient in citric-soluble phosphates to an extent exceeding the limits of error prescribed in the Ministry's regulations, and in five cases the basic slags were deficient in total phosphates, two of the samples containing only 71 per cent. of the guaranteed quantity. Two samples of basic slag were found to contain mineral phosphate mixed with the slag. A sample of sulphate of ammonia was found to be deficient in nitrogen and to contain 0.33 per cent. of free sulphuric acid and 5.0 per cent. of water, the deficiency in nitrogen probably being due to the absorption of water by the free acid in the sulphate.

The feeding stuffs included ground oats, clover meals, fish meals, coconut cake and pea meal, alleged to contain foreign materials, and various meals and cakes deficient in oil and albuminoids when compared with the guarantee on the invoice. The ground oats, in some cases described as "Sussex Ground Oats," were adulterated to an extent varying from 20 per cent. of barley meal to 90 per cent. of barley, maize, weed seeds and oat-shudes. The clover meals contained 50 per cent. of material not derived from clover. A sample of coconut cake contained 17 per cent. of castor oil cake; fish meal 30 per cent. of vegetable matter and sand; and a sample of pea meal, 45 per cent. of wheat and maize. Among the samples deficient in oil and albuminoids were a meat-and-bone meal containing only two-thirds, and a meat meal with less than one-half of the guaranteed quantities of albuminoids.

The Meaning of "Commercial Blue Vitriol."

Inquiries instituted in connection with proceedings under the Merchandise Marks Act, led to the examination of a considerable number of samples in order that information might be obtained as to the composition of the agricultural materials concerned as placed on the market. One inquiry, in the course of which 71 samples were received, related to the quality of the blue vitriol supplied for horticultural or wheat-dressing purposes throughout the country. Sixty-five of the samples were sold under the descriptions "Blue vitriol," "Blue stone," or "Copper sulphate," and of these 53 contained more than 98 per cent. of crystallised copper sulphate, while 12 were almost up to this standard. Two other samples, consisting of mixtures of copper sulphate and ferrous sulphate in approximately equal proportions, and sold under the description "Commercial blue vitriol," were the subject of legal proceedings, at which it was contended that it was a trade practice to apply the term to copper sulphate containing large quantities of ferrous sulphate. This contention was negatived by the result, the seller being fined.

Work for the Customs and Excise Departments.

In order to avoid delay in the examination of samples for the Customs and Excise Department, chemical stations have been established at the more important seaports and one inland town, where samples are tested by Customs and Excise Officers who have been specially trained at the Government Laboratory for this purpose. The chemical station at Liverpool is in charge of one of the chemists on the staff of this Department.

The number of samples tested for arsenic, including beer, wort, malt, sugar, and other materials used in brewing, was 462. Of these 66 were found to contain arsenic in excess of the limit laid down by the Royal Commission on Arsenical Poisoning—namely, the equivalent of one-hundredth of a grain of arsenious oxide per pound in the case of solids, or per gallon in the case of liquids. Of the 208 samples of malt and sugar tested, only three contained arsenic in excess of the limit, but the limit was exceeded in three instances out of 61 samples of beer and wort.

During the year the question of the presence in chocolate of fat other than cocoa butter has continued to receive attention. Fat expressed from the cocoa nib during the manufacture of cocoa powder was formerly available in large quantities for incorporation in chocolate in which a varying proportion of extra fat is desirable. For various reasons manufacturers have been constrained to use a substitute which, whilst not derived from the cocoa bean, closely resembles cocoa butter in its physical and chemical properties. The estimation and even the detection of this fat when incorporated in chocolate presents great difficulties, but the method devised in this Laboratory has been applied with satisfactory results.

Under the provisions of the Dangerous Drugs Act, the importation or exportation of prepared opium is prohibited. The Act, further, makes it an offence, *inter alia*, to import or export without licence, certain drugs [morphine, diamorphine (heroin), cocaine and ecgonine], or preparations containing more than a certain percentage of these drugs. In suspected cases the Officers of Customs and Excise sample the goods and the samples are examined at the Government Laboratory; 105 such samples were received, and of these three were found to contravene the provisions of the Act. One sample bearing the seal of a foreign company and marked "Cocainum hydrochloricum," was seized by officers, but it consisted of quinine hydrochloride, and two samples with indistinct markings, but bearing labels of a foreign cocaine company were found to consist of benzoic acid.

Dyestuffs (Import Regulation) Act, 1920.

Six hundred and thirty-three samples of imported colours, lakes, and other goods were examined to ascertain whether they contained synthetic organic dyes or intermediate products, the importation of which is prohibited except under licence.

One hundred and seven samples of matches were submitted under the White Phosphorus Matches Prohibition Act, 1908. None of the samples showed any evidence of the presence of white phosphorus.

Safeguarding of Industries Act.

This Act came into force on October 1, 1921, and nearly 8,000 samples were examined during the year. The object of the examination in most cases was as to (*a*) whether the chemical substance was such as to come within the class of those liable to tax; or (*b*) whether, in the case of substances bearing trade names without indication as to their ingredients, such as medicinal preparations, toilet articles and perfumes, the imported article contained any substances liable to tax, and if so in what proportion. The analysis of many of the samples such as medicines, perfumes and proprietary articles, is of an intricate nature, especially as in some cases no information is available as to the composition of the goods.

Industrial Alcohol and Fusel Oil.

882 samples of wood naphtha and mineral naphtha intended for use in the preparation of methylated spirit were examined. The naphtha represented by 877 of these samples was approved as fit for methylating purposes. One thousand eight hundred and one papers were dealt with relating to applications to the Commissioners of Customs and Excise, either (1) in respect of claims for rebate on alcohol used in making medicinal preparations or for scientific purposes, or (2) in connection with permission to receive methylated spirit and other forms of duty free alcohol for use in manufactures, tuition and research. A further amount of work has been done in connection with the inquiry into the characteristics of denaturants and colouring substances for alcohol for industrial purposes.

Fusel oil, which consists largely of butyl and amyl alcohols, is a by-product in the manufacture of ethyl alcohol, and is of considerable commercial importance as a constituent of lacquers, varnishes, etc. Fusel oil, whether imported or home produced, generally contains ethyl alcohol as an unavoidable impurity, but duty is not charged unless upwards of 15 per cent. of proof spirit is present. This was the case in 15 of the 108 samples of imported fusel oil submitted for examination, and as an alternative to payment of duty, the importers were allowed to reduce the proportion of proof spirit to the limit of 15 per cent. Thirty samples of fusel oil from British distilleries were examined. Of these 9 were found to contain more than 15 per cent. of proof spirit and delivery out of revenue control was refused until the proportion of spirit had been reduced. Ethyl acetate, which is a tariff article, is found in commercial amyl acetate prepared from fusel oil containing ethyl alcohol. In view of this a proportion of ethyl acetate equivalent to the alcohol allowed free in fusel oil is admitted free of duty in commercial amyl acetate.

Denatured spirits, if imported, are chargeable with duty, but wood spirit (methyl alcohol) is not dutiable unless purified so as to be potable and consequently liable to be used as a substitute for ordinary spirit. Of 82 samples of methyl alcohol 46 were found liable to duty on the ground of purity.

Glucose and Saccharin.

In connection with the assessment of duty on glucose, 136 samples of glucose solution taken from charging vessels during the course of manufacture were examined in order to check the manufacturers' declarations; 419 samples were taken for assessment of drawback on exportation; and 576 samples of imported glucose and of glucose used in syrups made at sugar refineries were examined. Owing to the heavy duty on saccharin, which has approximately 500 times the sweetening power of sugar, the inducement to smuggle this article into the country is very great. Saccharin has, therefore, to be searched for in all preparations in which there is any probability of its occurrence, and 179 samples of substances imported were specially examined with this object. 154 samples of saccharin and articles containing saccharin were examined for the purpose of assessing the amount of drawback payable on exportation; and 49 samples of saccharin and of the materials used in its production were examined in connection with the assessment of duty on saccharin manufactured in this country.

Tobacco.

The work of the Government Laboratory in connection with tobacco consists chiefly in the examination of unmanufactured and manufactured imported tobacco, tobacco manufactured in the United Kingdom for home consumption, tobacco and commercial snuff for drawback on exportation, and offal tobacco for drawback either on exportation or on abandonment or for denaturing. In the ordinary process of manufacturing tobacco or preparing dry leaf for smoking, nothing as a rule may be added to the leaf except water. When, however, raw tobacco is made into "roll tobacco," either by spinning or twisting the leaf into coils, olive oil is allowed to be used to prevent the coils adhering to each other during stoving, a process which involves the subjection of the rolls to heat and pressure. The proportion of water which may be present in manufactured tobacco is limited by statute to 32 per cent., and the quantity of oil in roll tobacco must not exceed 4 per cent. The percentage of moisture was determined in 10,570 samples, and the percentage of oil in 1,960 samples taken by the Customs and Excise officers from the stocks of manufacturers and retailers of tobacco.

Various substances, such as sulphur, asafœtida, sago flour, tar oil, carbolic and cresylic acids, moss litter, soda ash, borax, hellebore, cayenne, lampblack, saltpetre, and anthracene oil are used in denaturing tobacco, and 179 samples of these materials were approved for this purpose. One hundred and fourteen samples of nicotine preparations, of which 53 were from imported goods, were examined, and 112 of these were approved for delivery free of duty. One hundred and thirty-one samples of essential oils submitted for approval for use in flavouring tobacco were examined, and 39 of these were found to contain prohibited ingredients. Six samples of solutions for preserving or improving the condition of tobacco were found to contain either fluorides, calcium chloride, sugar or honey, and their use could not be approved. One sample of a solution used for denaturing leaves in the course of manufacture contained saltpetre, added for the purpose of remedying the poor burning qualities of the leaf.

A number of metals was examined for the Disposal Board in order to facilitate grading. Sufficient quantity of waste material from gun sights and luminous dials is now in hand to render a further recovery of radium profitable. The recovered radium is held in reserve for Government use.

As in previous years, the examination was continued for the Home Office of lead glazes, dust, rubber mixings, enamels, and other materials in connection with special inquiries affecting the health of workers in factories.

In connection with a fire and explosion at a works where a synthetic dye was being ground and mixed, an investigation into the properties of the dye was carried out. It was found that under certain conditions the dye would take fire and explode, but that the danger was easily obviated by altering the nature of the plant.

The paper, pigments, and gum used in the manufacture of postal, fiscal, national health, and unemployment insurance stamps were systematically examined for quality and freedom from deleterious substances. The samples examined included postal obliterating fluids, creosote oils, and copper sulphate for the telegraph and telephone services, and miscellaneous stores, such as white and red lead, soap, carbide, sealing wax, oils, waterproofed clothing and fabrics, rubber tyres, and lubricating oils. A sample purporting to be effective for stopping leaks in motor-car radiators consisted of borax and shellac.

Proprietary Materials Offered to the Office of Works.

The samples examined for the Office of Works, London, consisted largely of materials purchased for the public

service. They included lubricating and other oils, motor spirit, soap and soap powder, disinfectants, fire-extinguishing fluids, paints and varnishes, coal, dust allayers, lime and sand. Some "preservatives" for stone and wood were examined, but it did not appear that anything new or more promising than the older preparations was in sight despite the claims of the makers. The question of the decay and disintegration of stone in town atmospheres is still urgent. Treatment of decaying structures with liquids can afford very limited protection and must be renewed periodically. The matter is becoming very serious with some buildings where impregnation with liquid is almost impossible, if not futile. In such cases the stone must be replaced. If this is effected by the same kind of natural stone as that originally used, disintegration arising from acids and soot must recur, so that the problem is much more involved than would appear at first sight.

Specimens of defective plaster from various buildings were examined showing that in one case at least the trouble was due to the short hair used as matting. In other cases nothing was disclosed to account for the rapid deterioration, except possibly the effect of damp. Samples of coke breeze and clinkers for making concrete were examined for sulphur and other constituents likely to cause trouble.

As usual, mainly articles were offered for use for which exceptional qualities were claimed for the purpose in view. Special paint-cleaners and renovators were found to consist of oil and silicates, and coloured mineral oil respectively. Another consisted of caustic soda solution. They offered no advantages over the ordinary method of cleaning paint surfaces. A marble "cleaner" consisted of a mixture of silica (silex) and chalk and was rather gritty. Its use for fine marble work was not considered desirable, and it did not differ appreciably, except in grittiness, from the solid matter usually found in polishing creams and polishing pastes. It is of interest to note that excellent results have been obtained by the treatment of the magnificent old tiles in the Chapter House at Westminster with aqueous 3 per cent. casein, containing a little formaldehyde, followed by a thin coat of matt varnish.

HONG KONG MARKET FOR DISINFECTANTS.

At present there is a fair demand for disinfectants in Hong Kong, states an American Consular Report, but the market fluctuates considerably, according to sanitary and health conditions both in Hong Kong and in South China. Sanitary conditions in Hong Kong are improving every year, owing to the construction of new sewers and sewage-disposal plants, and the development of new drainage schemes, with the result that the local demand for disinfectants is decreasing. However, in view of the poor sanitary conditions in the interior of South China, there is still a great need in that section for purifiers of all kinds. Imports of disinfectants into Hong Kong for the years 1921 and 1922 were reported as follows:—From United Kingdom, £8,536, in 1921 and £5,790, in 1922; United States, £4,849, in 1921 and £752, in 1922; Japan, £2,776 in 1921 and £3,910, in 1922; all other countries, £1,429, in 1921 and £1,791, in 1922; total, £17,590, in 1921 and £12,243, in 1922. The kind in most demand is a cresol disinfectant, ranging in strength from 5 to 15 per cent., which can be sold to the Chinese dealers at approximately 4s. per gallon. At present there is one large Hong Kong firm purchasing this disinfectant in Shanghai for about 3s. 4d. per gallon. After paying freight and shipping charges, the Chinese dealers place the product on the market under their own brands, or "chop," at about 4s. 3d. per gallon.

Indian Sesamum Crop.—The first forecast for the 1923-24 sesamum crop is based on reports received by the Indian Department of Statistics from provinces which contain, on an average, 99.6 per cent. of the entire area under sesamum in British India. The returns dealt with in this forecast, however, exclude estimates of area in the United Provinces and those of the late crops in Bengal and Burma, which are not available at present. The total area, so far reported, is 2,100,900 acres as compared with 2,367,000 acres (revised) at this time last year. Sowings still continue in many places. Seasonal conditions at sowing time were favourable except in Bengal and Madras, where early rains failed. The present condition of the crop is, on the whole, fair.

OUR BOOKSHELF.

The Absorption of Nitrous Gases. By H. W. Webb, M.Sc. (B'ham), F.I.C. (Head of the Department of Chemistry and Industrial Chemistry, Technical College, Cardiff). 1923: London: Edward Arnold and Co.; demy 8vo., 25s. net.

The absorption of nitrous gases in water is a very important practical problem at the present day, particularly in the fixation-of-nitrogen processes, and Mr. Webb has rendered valuable service to chemical industry by devoting a special volume to the theoretical and practical treatment of the subject. The chemical principles underlying the process have not been studied to a very great extent, in spite of the contrary opinion that the huge number of patent specifications on the matter would suggest, and it is very often the case that the absorption process is conducted with rule-of-thumb methods with an efficiency much below the maximum attainable with thorough scientific control. The volume commences with a discussion of the more important properties of the oxides and oxy-acids of nitrogen having a direct bearing on absorption practice. The theoretical problems of absorption are then dealt with in great detail, and are followed by a highly valuable practical chapter on the construction of absorption towers, giving some broad figures of comparative costs. The important question of filling materials receives a whole chapter to itself. Subsequent sections deal with gas circulation and measurement, the handling of nitric acid in the absorption system, the production of concentrated nitric acid, and the production of synthetic nitrates and nitrites. The final chapter is an excellent one, dealing with analytical control. The book is well produced and excellently illustrated. Sulphuric-acid manufacturers who search its pages in the hope of finding information on their own problems of nitrogen-oxide absorption will be disappointed. Possibly in a later edition Mr. Webb may consider it advisable to include absorption of nitrous gases in vitriol within the scope of his work.

Water Treatment. Brochure issued by Messrs. Brunner, Mond and Co., Ltd., Northwich, Cheshire. Copies may be obtained by readers of the *Chemical Trade Journal and Chemical Engineer* upon application direct to the company.

This is a publication (W.T. 231) of the research staff of Messrs. Brunner, Mond and Co., Ltd., giving a particularly readable and explicit account of the scientific principles underlying the hardness of water and the methods to be adopted for the prevention of scale and corrosion. The book is divided into 14 sections, and includes a detailed explanation of the causes of hardness in water, methods of analysis, and the principles of the elimination of the calcium and magnesium salts by means of the soda ash and lime treatment. A valuable section is that dealing with the choice of softening plant, and particular stress is laid on the necessity of installing a plant of sufficient capacity, so as to allow ample settling. Many engineers and chemists do not realise the importance of this point, which has caused much trouble in the working of water-softening installations. The chemist will be particularly interested in the more difficult problems of water-softening, discussed in detail in the book, such as the removal of the last traces of magnesium and the elimination of oil and grease. The booklet should do good work in spreading much-needed light on the whole question of feed-water treatment.

Dairy Farming. Renwick Hutson Leitch. Edinburgh: W. Green and Son., Ltd.; 6s. net.

Dairy farming is a subject which the average person is inclined to regard as a very simple and commonplace "cows to the meadow and home to the barn" sort of business, yielding copious and regular supplies of milk and easily obtained by-products. This book treats the subject with all the intelligent and scientific precision which modern industry requires. It is one of the Scottish Series of Junior Agricultural Textbooks (general editor, Professor James Hendrick, B.Sc., F.I.C.), and these Scottish books are very thorough. Every aspect met with in the selection and management of a dairy farm are dealt with in a volume the text of which is interspersed with excellent illustrations.

ITEMS OF INTEREST.

Personal.—Mr. Frank B Gorin has been appointed chief of the heavy chemicals section of the Chemical Division, U.S. Bureau of Foreign and Domestic Commerce.

University News.—Swansea Town Council has decided to apply for a provisional order to enable them to advance £50,000, to the University College of Swansea.

Fatal Laboratory Oil Test.—One person was killed and nine injured during a test of internal combustion oil at the Bureau of Standards last week. The oil exploded, and the small building where the test was made was wrecked.

Iron Ore Pits Closed.—Pennington iron ore pits in Furness were closed indefinitely on Saturday last. Operations also ceased on Saturday at the Yarlside pits of the Barrow Hematite Steel Company. Two hundred and twenty men are affected.

Medical Research Council. — Sir Archibald Garrod, Regius Professor of Medicine, University of Oxford, has been appointed a member of the Medical Research Council, from September 30 next, to fill the vacancy caused by the retirement of Professor F. Gowland Hopkins.

Bromine in the U.S.—The total quantity of bromine (including the bromine content of bromides) consumed in the United States in 1922 amounted to 1,005,174lb., worth 150,668 dollars, against 711,953lb., worth 172,759 dollars, in 1921. Imports amounted to 1,094lb., against 300lb. in 1921.

Obituary.—The death, on September 3, is announced from Germany of the well-known agricultural chemist, Professor Dr. A. Stutzer, of Königsberg University. The late Professor Stutzer carried out numerous and important researches on Chile nitrate, nitrification and denitrification, soil micro-organisms, composition and action of fertilisers, etc.

Synthetic Vanillin in Germany.—The firm Aktiengesellschaft Josef Hösl, Vanillin Fabrik, Hanover, has just been established at Hanover. Its specialities will be the manufacture of synthetic vanillin, and of two catalytic materials, both known as Je me L, one for oxidation reactions and the other for acetylation reactions.

Japan Suspends Import Duties.—The British Consul General at Kobe reports by telegraph the issue of Japanese Imperial Ordinances providing for the suspension, until the end of March next, of the import duties on a large number of commodities, including certain acids and chemicals, oils, cement, plate and sheet glass. Other import duties will be suspended as necessary.

Reduced Petrol Prices.—It is officially stated that from September 25 the prices for the leading brands of petrol are reduced throughout the United Kingdom and Ireland. The new retail prices for England and Wales are:—No. 1, 1s. 6½d.; No. 3, 1s. 4½d.; Scotland: No. 1, 1s. 7½d.; No. 3, 1s. 5½d.; Northern Ireland and Irish Free State: No. 1, 1s. 8½d.; No. 3, 1s. 6½d.

Metric System in America. — Following the lead of the Medical Department of the Army, the U.S. Public Health Service has dropped the metric system from its specifications covering the purchase of drugs and medical supplies. The General Supply Committee of the Treasury Department has also adopted this procedure. The question of eliminating the metric system from specifications of other purchasing departments of the Government is understood to be pending.

Publication of Scientific Works Suspended in Germany. —It is stated that the leading German publishers decided at a meeting held on August 21 to suspend entirely the publication of scientific works. It has been shown that those issued during the past few weeks have been a drug on the market, as the people who constitute the reading public for such books have no money to purchase them. Even the public and university libraries can no longer afford to do so. —*Pharm. Journal.*

British Industries Fair. — The future control and organisation of the Birmingham Section of the British Industries Fair, has been modified as a result of a meeting of the incorporated body governing it. The entire control of the fair thereby reverts to the Birmingham Chamber of Commerce, who were the original sponsors of the undertaking. The Chamber, through its Fair Management Committee, is already making arrangements for the fair to be held at Castle Bromwich from May 12 to 23 next.

Business Notice.—In the reorganisation of the business of Armstrongs and Main, Ltd., the title of the company has been altered to A. and J. Main and Co., Ltd.

Australian Chemical Imports.—The value of chemicals, drugs and fertilisers imported into Australia during the year ending June 30, 1923, amounted to £3,894,435, compared with £3,553,377, for the previous twelve months.

New Radium Deposit Discovered. — A large deposit of radium is reported to have been found in Turkestan, according to an announcement from Petrograd, the discovery having been made by members of the Russian Radium Institute.

Canadian Imports of Chemicals.—Chemicals and allied products to the value of 25,690,382 dollars were imported into Canada during 1922, of which the United Kingdom provided 3,765,429 dollars worth and the United States 18,162,209 dollars worth.

Tariff Notes.—The duty on petrol, benzine, and similar volatile oils imported into British North Borneo has been fixed at the rate of 25 cents per gallon.—The Mexican duty on imported common soap has been increased to 0.15 pesos per kilog.

Institution of Chemical Engineers. — Owing to great public demand, a limited number of copies of the paper on "Industrial Oxygen" read by Mr. T. Campbell Finlayson (Associate-Member), B.Sc., before the Institution of Chemical Engineers in June last have been published and are issued to the public at the price of 10s. 6d. each.

New Research Association.—A licence has been issued by the Board of Trade to the Research Association of British Flour Millers, which has been approved by the Department of Scientific and Industrial Research as complying with the conditions laid down in the Government scheme for the encouragement of industrial research.

Trade with Serbia.—Captain E. Murray Harvey, Commercial Secretary at Belgrade, will be in attendance at the Department of Overseas Trade on October 1, 2, and 3, for the purpose of interviewing manufacturers and merchants interested in trade with the Serb-Croat-Slovene Kingdom. Applications for interviews should quote the reference 4937/T.G.

Industrial Oxygen on the Tees-side. — Situated on the north bank of the Tees, between Stockton and Billingham, the new branch of the British Oxygen Company, Limited, was formally opened on Wednesday of last week. The branch has been erected to supply the demands of the whole of the Tees-side area, and save the present cost of carriage from the previous nearest branch at Newcastle.

Iron-ore Discovery in Wales.—Considerable deposits of limonite are reported to have been found on the Breconshire border at Ystradfellte and Penderyn. Tests have disclosed a seam 20 inches thick 20 feet from the surface. A second seam was found a little lower. It is believed steps will be taken immediately to develop the deposit for commercial purposes. Conditions are favourable for the enterprise.

Trade Inquiry for Salt. — Tenders are invited for the supply of about 500 tons of salt to be used on the streets in connection with snow removal during the winter, for the Birmingham Corporation. Conditions of contract, form of tender and schedules may be obtained at the office of Mr. H. H. Humphries, city engineer and surveyor, Council House, Birmingham. Tenders, sealed and endorsed, should be delivered at the City Engineer's Office by October 8.

British Iron and Steel Production.—The National Federation of Iron and Steel Manufacturers announce that the production of pig iron in August amounted to 599,800 tons, compared with 655,100 in July and 411,700 tons in August, 1922; the furnaces in blast at the end of the month numbered 196, a further decrease of 10 during the month. The output of steel ingots and castings amounted to 582,700 tons, compared with 624,300 tons in July and 528,400 in August, 1922.

Chemical Merchant's Affairs. — On September 21 the first meeting of creditors was held of Thomas James Shilvock (trading as Shilvock, Son and Co.) of Globe Chambers, 493, New Cross Road, S.E., dealer in chemicals, against whom a Receiving Order was made on September 11, 1923, on a creditor's petition. The statement of affairs lodged by debtor showed liabilities expected to rank for dividend £380. His assets consisted of shares in a limited company and one bad book debt, the realisable value of which was not stated. The estate was left in the hands of the Official Receiver.

Piece-dyers Price Proposals. — A meeting of merchants in the cotton trade, held in Manchester on Tuesday last, unanimously declined to accept the proposal by the Piece Dyers' Association to offer customers a rebate of 10 per cent. conditional upon those taking advantage of it signing an undertaking to place all orders with members of the Association.

Russian Chemical Works Electrified.—The central power station for the Bondyuzh chemical factory has just been started, states the *Electrical Review*. The construction was begun in 1917, but for various reasons its completion was delayed. It is a 750-k.w. station, and it is intended to add a 500-k.w. turbo-generator for reserve. It will be fuelled exclusively on peat from its own factory.

Ontario Gypsum Deposit.—The discovery is announced in Northern Ontario of an immense deposit of gypsum, which extends one mile along a tributary of the Moose River, running inland for 10 miles. The deposit is 40ft. deep at the outcrop on the bank of the river. Analysis shows that the deposit is 99.8 per cent. pure. Patent rights have been granted to the discoverer, Mr. T. J. McDermid, Saulte St. Marie, Ontario.—*Engineer*.

Working Life of Electrical Machinery. — Electric motors are of so recent introduction that records of great longevity must be few. An interesting example is reported from Sacramento, California, where what is known as a Westinghouse Tesla type B. alternating-current induction motor has been running for 27 consecutive years, or since 1896. It is 15-horse-power, 3-phase, 60-cycle, 500volt, and makes 1,200 revolutions per minute.

Camphor Production in India.—As a result of investigations conducted by the Forest Research Institute, Dehra Dun, it is concluded that camphor may be easily cultivated in all parts of India with a rainfall of 40 inches and over, but that as a commercial enterprise its cultivation should not be attempted outside the tropical areas, and that even in the latter areas the financial returns are likely to be small while camphor remains about its present price.

Soap Manufacture in Esthonia.—The glut on the market, which was already heavily stocked with foreign products, has lessened the profits of soap production in Esthonia. Protective measures in support of the home industry are in contemplation, notwithstanding the fact that the existing duty on imported soaps is high. The general policy of the Esthonian Government, however, states a Department of Overseas Trade Consular Report, is to favour the reviving industries of the country by means of a protective tariff.

Canadian Production of Heavy Chemicals. — According to the Dominion Bureau of Statistics, the value of acids, alkalies, salts and compressed gases, manufactured in Canada during 1922, amounted to nearly 17,600,000 dollars, an increase of more than 4,000,000 dollars over the value of the output of 1921. The production of sulphuric acid was 67,280 tons (an increase of more than 20,000 tons), valued at 1,390,000 dollars. The total production of compressed gases (including oxygen, acetylene, carbon-dioxide, anhydrous ammonia and hydrogen) was valued at 2,000,000 dollars.

Caustic Soda in Brazil. — In the annual report of the British Chamber of Commerce of Sao Paulo, it is stated that with reference to a proposal in the Brazil Chamber of Deputies to increase the duties on imported caustic soda and bleaching powder by 133 per cent., the Chamber in co-operation with the Rio Chamber approached the various commercial associations concerning the iniquity of such a proposal merely to protect a small Brazilian plant, which was unable to supply more than ten per cent. of the local demand. Protest against the proposed action was so strong that it is understood the project has been withdrawn.

Aluminium Chloride in Petroleum Refining.—The refining of petroleum uses the largest amount of aluminium chloride at present, and seems likely to demand additional supplies of the chloride in the future, states the *Engineer*. This salt converts all unsaturated compounds into saturated compounds. Frequently this conversion is made by throwing out the excess of carbon over hydrogen in the hydrocarbon, whereupon the carbon blackens the aluminium chloride and forms a coke; gases need not be liberated. The most astonishing consequence of this saturating action is that unstable petrol and lubricating oils made from asphalt-base petroleum yield excellent stable products of good colour and odour; in fact, they are almost paraffin-base products.

Iodine in the Tanning Industry.—H. F. Smyth and E. F. Pike (*Amer. Jour. Hygiene*, 1923, 11, 224) state that iodine is the most effective disinfectant for anthrax in hides and skins, and may be applied without the slightest injury to the hides. The iodine may be used as vapour, in aqueous solution, or in solution in carbon tetrachloride.

Eczema from Potassium Persulphate.—Mr. A. R. Tankard, F.I.C., Public Analyst for the City of Hull (The *Lancet*, August 11), states that the use of potassium persulphate as a flour "improver" may give rise to a severe form of "eczema" in the bakers who manipulate flour containing it. The persulphate when moistened decomposes with formation of potassium acid sulphate, and this, in contact with delicate skin surfaces, causes the trouble.—*The Pharmaceutical Journal*.

Ferric Hydroxide in Arsenic Poisoning.—H. C. Wood (*Jour. Amer. Pharm. Ass.*, 1923, xii., 482-483) advocates strongly the use of ferric hydroxide as an antidote in arsenic poisoning. Ferric hydroxide forms a relatively insoluble compound with arsenic, and thereby greatly retards the absorption of the latter. The insoluble compound is removed from the stomach by the vomiting which is an almost constant symptom of arsenical poisoning, or by the administration of emetics and laxatives.—*J. of Fr. Inst.*

Multiple Helix Tower Filling. — In an article entitled "Tower Fillings for Industrial Arbsorption," in *Chemical and Metallurgical Engineering*, September 10, 1923, Mr. P. D. V. Manning draws attention to the increasing use of the Brégeat multiple helix filling. This element consists of two, three, or four wire helices coiled coaxially. The four helix type is most commonly used. This filling presents an effective surface for volume occupied greater than that of any other element, and this is further increased in use through the formation of films of liquid between the turns of wire.

The Schiff's Reaction for Aldehydes. — Schiff's reaction, states K. Josephson (*Ber.*, 1923, 56, 1771), can be applied to aldehydes only under definite conditions with regard to the acidity of the solution; the development of a not too weak, violet colouration is regarded as a fairly definite proof of the presence of the aldehydic group. A red colouration is caused by a number of organic substances (proteins) which in all probability do not contain the aldehydic group; the tint is identical with that of rosaniline solutions. The effect is attributed to the withdrawal of a portion of the sulphurous acid from combination with rosaniline (to form salt-like compounds with the proteins) whereby rosaniline is liberated. A red colouration is also developed when Schiff's solution is treated with phosphate buffer solutions of p 4.5–7.8, the maximum intensity being observed at p 5.9–6.1.—*J.S.C.I.*

COMING EVENTS.

Society of Dyers and Colourists (Manchester Section).—Meeting, **Friday, September 28,** at **7 p.m.**, at the Manchester Literary and Philosophical Society, 36, George Street. Paper: "Colloid-chemical Researches in Connection with Naphthol AS.," by Dr. J. Julius Rath.

National Gas Exhibition.—September 17 to October 3, at Bingley Hall, Birmingham.

Institution of the Rubber Industry (London Section).—Meeting, **Monday, October 1,** at **8 p.m.**, at the Engineers' Club, Coventry Street, London, W. Paper: "Plantation Life from a Topical Point of View," by C. Baxendale.

Society of Public Analysts.—Meeting, **Wednesday, October 3,** at **8 p.m.**, at the Chemical Society's Rooms, Burlington House, Piccadilly, W. Papers: "The Sampling of Coal," by J. H. Coste, E. R. Andrews, and W. E. F. Powney; "A New Test for Distinguishing Castor Oil," by H. G. Stocks; "The Volumetric Estimation of Vanadium in Steel," by A. E. Etheridge; "The Iodimetric Determination of Sugars," by C. L. Hinton and T. Macara.

Chemical Society. — Meeting, **Thursday, October 4,** at 8 p.m., at Burlington House, Piccadilly, London, W. 1. Several papers will be read.

Society of Chemical Industry (Bristol Section).—Meeting, **Thursday, October 4,** at **7.30 p.m.**, at the University, Woodland Road. Paper: "An Outline of Rubber Manufacture," by J. F. Reid.—**(Manchester Section)**: Meeting, **Friday, October 5.** Address: "Recent Progress in Chemistry," by the chairman of the Section, Dr. H. Levinstein.

REPORTS OF COMPANIES.

Nobel Industries, Ltd.

The annual general meeting was held on Friday, September 21, in London, Sir Harry McGowan in the chair.

The Chairman, in moving the adoption of the report and accounts, said:—Our primary industry, as you are aware, is explosives of all kinds, detonators, fuses, etc., for mining purposes. Shareholders will be interested to learn that the company's trade in blasting explosives in South Africa has shown distinct improvement during the past year. You will remember that I mentioned at our last meeting that, in conjunction with American explosives manufacturers, we had decided to erect a factory in Chile. That factory is now operating, and will be in full working order by the end of the present year. With the Continent disturbed as it is, one cannot expect great things from our investments in explosives factories in the various European markets in which we are interested, but our factory in Czecho-Slovakia is now manufacturing and working at a profit, and it is anticipated that the factories in which we are interested in Hungary and Roumania will be operating by the end of the present year.

The future of commerce is still uncertain There has been undoubtedly a reaction in business during the past two or three months, and it is impossible for one to express an opinion as to when we shall see a return to normal conditions. It may be because the Ruhr and other European problems appear unsolvable at the moment that a settlement might come more quickly than many of us dare hope, but until we have a settlement of these problems those of us engaged in running big commercial undertakings such as this have got to walk warily and take no undue risks. The first six months' results of the present year are of a promising character, and in the absence of any great upheaval, political or commercial, I see no reason to anticipate that the results of the present year will fall short of 1922, and as these were so much better than in 1921 I think this must be a source of gratification to our shareholders.

British Glues and Chemicals, Ltd.

The report for the year to May 31 last states that the balance brought forward from last year amounted to £64,696; add net profit for the year, after allowing for depreciation £31,814.) and bad and doubtful debts, £35,814.; total, £100,510.; deduct net amount paid on account of taxation, £22,041., leaving to be carried forward, subject to balance of taxation liability, £78,469. Notwithstanding unceasing efforts to come to agreement with the Inland Revenue Authorities, it has not been possible to ascertain the company's taxation liability. The directors regret they cannot recommend the payment of dividends on the preference and ordinary shares. No dividend has been paid on the preference shares since September 30, 1921.

Pilbara Copper Fields, Ltd.

Accounts for two years to June 30, 1922, show a loss for period of £5,043., increasing the debit balance to £10,792. In accordance with agreement with second mortgage debenture holders, no interest accrues until July 1, 1925. Shareholders were advised in June last of an agreement having been entered into to adopt the treatment process controlled by Minerals Separation, Ltd. That company's metallurgist and assistants arrived on the mine early this month, and are erecting a small experimental plant for systematically testing various classes of ore and consulting as to installation of a commercial plant. Meanwhile development work is being proceeded with in the mine.

DIVIDENDS.

British Cotton-seed Products, Ltd.—Accounts for year ending March 31 show a loss of £3,935., which increases debit balance to be carried forward to £10,105.

English China Clays, Ltd.—Interim dividend at rate of 4 per cent. per annum, less tax, on ordinary for half-year. Last year no dividend.

American Cyanamid Company.—A dividend of 1½ per cent. has been declared on the preferred stock and 1 per cent. on the common stock.

English Margarine Works, Ltd.—It is announced that no dividend will be paid on the preference shares.

LEGAL INTELLIGENCE.

AMMONIUM PERCHLORATE DURING THE WAR.

Frederick William Jenkins.

On Tuesday the public examination was concluded of F. W. Jenkins, described as of 18, Belgrave Road, Pimlico, and Lightcliffe, Lower Warberry Road, Torquay, against whom a receiving order was made on May 16, 1923, on a creditor's petition. The statement of affairs showed liabilities expected to rank £9,001. 18s. 11d., and assets consisting of interest in a contract to receive certain shares, the value of which were stated to be uncertain, also one bad book debt £1,000., estimated to produce nil. Debtor stated that he had failed on a previous occasion in 1907, when he was adjudged bankrupt. He obtained his discharge on November 16, 1911. About 1915 he was introduced to the inventor of a high explosive known as "High Explosive 30." The inventor said the British patent had lapsed, but he had the remainder of the term of the American patent. Amongst the constituents of the explosive was ammonium perchlorate. To manufacture the explosive it was essential to get a supply of ammonium perchlorate, but at that time it was difficult to obtain. Professor Henry Jenkins about this time was interested in various chemical patents, and he was approached with a view to ascertaining whether his patent could be utilised for the manufacture of ammonium perchlorate, and eventually it was proved that the perchlorate could be manufactured much more cheaply by the Professor Jenkins' process than under any other process. Subsequently a contract was given by the Ministry of Munitions for 20 tons of ammonium perchlorate per week at 1s. per lb.; the cost of manufacture was estimated at 5d. per lb. The patent of the process for the perchlorate was vested by Professor Jenkins in a company called the C.I. 1914 Syndicate, Ltd. Arrangements were made for the production of the ammonium perchlorate at a factory in Halifax, but no actual business was done, and debtor estimated his loss in connection with this venture at £1,000.

VOLUNTARY LIQUIDATION OF OIL REFINERS.

The Veglene Oil Refinery and Chemical Works, Ltd.

A meeting of the creditors of the above was held on September 21, at Cardiff, when a statement of affairs was submitted which showed liabilities of £1,228. 16s. 8d., of which £968. 18s. 1d. was due to unsecured creditors. There were debentures for £2,000., and interest accrued £15., while there was an amount of £33. 5s. due to a Mr. Fisher. The assets totalled £1,818. 5s. 7d., from which had to be deducted £29. 19s. 2d. for preferential claims, leaving net assets of £1,788. 6s. 5d., which was not sufficient to cover the claim of the debenture holders, and there would, therefore, be nothing available for the unsecured creditors. The issued capital was £2,000., thus showing a deficiency as regarded the shareholders of £3,228. 16s. 8d. The company was registered on September 24, 1921, with a nominal capital of £5,000., divided into 5,000 £1. shares, and it appeared that the trading had never been successful. Balance-sheets prepared showed that for the period from September 24, 1921, to December 31, 1921, there was a loss of £430. For the period from December 31, 1921, to September 30, 1922, the loss was £660.; while from October 1, 1922, to August 31, 1923, there was a loss of £409. It was stated that the assets had been written down very considerably in the statement of affairs, as it was not anticipated that at a forced sale they would realise any more than the figures at which they were set down.

A resolution was passed confirming the voluntary liquidation of the company, with Mr. S. E. Clutterbuck as liquidator, while a committee of inspection was also nominated.

The Barium Test for Sulphates.—The presence of ferric salts seriously impairs the delicacy of the barium test for sulphates, but reduction of the iron salt with hydrazine or hydroxylamine, states F. L. Hahn (*Ber.*, 1922, 56, 1723), enables the detection of the sulphate ion to be made with certainty. Without reduction it is impossible to detect less than 0.1 per cent. SO_4 in 0.4—0.8 gramme Fe_2O_3, but with preliminary reduction, as little as 0.02 per cent. may be detected. Salts of aluminium and of chromium do not appreciably affect the delicacy of the test for sulphates.—*J.S.C.I.*

FERTILISER NEWS.

Nitrate of Soda.—After a long spell of comparative inactivity, the nitrate market has experienced another spurt of buying, some 280,000 tons having been sold by the Producers' Association during the past fortnight. Total sales for shipment after July 1, 1923, having now reached 1,225,000 tons, compared with about 860,000 tons at this time last year, much is being heard on the one hand of the desirability of purchasing nitrate shares, while on the other, it is forecasted that higher prices are bound to ensue as a result of the increased production thought to be necessary. Of the 280,000 tons sold, it is stated that nearly two-thirds of the quantity has been taken by the United States, the remaining 100,000 tons being destined for Europe. It is rather surprising to find so large a purchase on behalf of this side, considering the heavy commitments already entered into, and the quiet tone on the Continent. It is known that the producers, in view of the assistance provided by the Chilean Government in the matter of postponing export duties, have exported large shipments of unsold nitrate to consuming markets, there to await purchase. This practice is mainly accountable for the export figures exceeding those of 1913, as they have been doing lately. During the first fortnight of September, for instance, a total of 113,000 tons left Chile, compared with 96,000 tons during the same period of 1913. Shipments to Europe and Egypt were the same, in spite of the continued absence of Germany as the largest buyer, while the U.S. took 27,000 tons against 16,000 tons, and "other countries," 15,000 tons against 9,000 tons. There is little doubt that merchants, and the larger consumers, have been holding back their purchases in the hope that nitrate prices would be reduced, until, fearful that the price of 21s. per quintal for shipment next spring might be raised, a rush to secure supplies at the advertised quotation was the result. Those who believe that prices will be raised, however, base their contention on the presumption that buying will continue at the rate indicated by the September rush, but this is hardly likely to be the case. Dr. H. Foster Bain, who has been visiting Chile on behalf of the U.S. Government in connection with the investigations into the world nitrate position, has returned to America, and presented a short preliminary report to Dr. Curtis of the Bureau of Commerce. According to Dr. Bain, he has been given every facility by the Chilean producers to collect information suitable for his purpose. In one or two of his generalisations, however, he directly contradicts certain statements issued by the U.S. Department of Agriculture in a report some three or four months ago. Most of what appears in the preliminary report is already known, and on the most important question, that of finding out how much prices might be reduced to meet possible competition from synthetic nitrogen, he does not feel free to speak publicly. His final report should be available in two or three weeks' time.

Sulphate of Ammonia.—The effect upon the sulphate market consequent on the disaster in Japan is very difficult to estimate, and, judging from the exports from this country, there is no falling off in shipments at the present time. It is a significant commentary on the general confidence in Japanese credit, but, nevertheless, it is extremely likely that orders from that country will fall off during the remainder of the year. The disorganisation in industrial and commercial circles, and the immediate need to concentrate on the reconstruction of the capital, Tokio, and the principal port, Yokohama, will absorb the national credit for some time. In these circumstances, it is probable that fertiliser purchases will diminish. In America, where a fair amount of material is exported to Japan on contract, it is thought that the material will have to be retained in the States, and, coming into the resale market, effect a slight reduction in prices. The market for British sulphate in France appears to be rather better, and prices are more on a level with the British export figure. The association for the protection of French buyers of British sulphate, referred to recently in this column, does not appear to have progressed at all. Indeed, it is surmised that the idea has died out. It is interesting to learn that the "Comptoir Francais du Sulfat d'Ammoniaque" has changed its name to the "Comptoir Francais de l'Azote." In an interesting paper before the North of England Gas Managers' Association at Bridlington on September 21 last, Mr. R. C. Taylor, B.Sc., Gas Engineer at Bridlington, painted a rather gloomy picture of the future of sulphate of ammonia, which, he said, was by no means assured. The acidity due to its breakdown in the soil, the fact of the uselessness of the sulphate radicle, the need of lime as a corrective, were disadvantages not to be overcome. In view of the coming competition from synthetic nitrogenous fertilisers, therefore, he suggested that members of the Association should concentrate on finding processes for the conversion of the ammonia liquor into compounds of the nature of urea, nitrate and phosphate of ammonia, with the idea of restoring the financial return which was so seriously threatened by the fixation processes.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Reliance Fuel Company, Ltd., London, E.C.—Registered September 6 (by order on terms), £750., £400., and £700. morts., to Mrs. F. I. Nalty, Glenarthan, New Road, Llanelly; Mrs. M. J. Hopkin, Delfan, Coedcae, Halfway, Llanelly; and H. Alexander, Court Gardens, Tunbridge Wells, and another.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Signet Salt Company, Ltd. — Resolved August 24: That the company be voluntarily wound up. J. Lonie, 32, Ilfracombe Gardens, Monkseaton, liquidator.

Veglene Oil Refinery and Chemical Works, Ltd.—Resolved September 5: That the company be voluntarily wound up. S. E. Clutterbuck, 31, Queen Street, Cardiff, liquidator.

Wheelton Cop Dyeing and Bleaching Company, Ltd.—Resolved September 1: That the company be voluntarily wound up. W. Howarth, 21, The Square, St. Annes-on-the-Sea, liquidator.

BANKRUPTCY INFORMATION.

Richardson, Thos., 95, Bank Road, Bootle, late trading at Shorey Bank, Darwen, as Evergloss Company, polish manufacturer. 1st meeting, O.R.'s, Liverpool, September 27. Exam., C.C., Liverpool, October 23.

Shilvock, Thos. Jas. (trading as Shilvock, Son and Co.), Globe Chambers, 493, New Cross Road, dealer in chemicals. R.O., September 11. 1st meeting, 29, Russell Square, London, W.C., September 21. Exam., C.C., Greenwich, October 16. Adjourned September 13.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," September 29, 1888.)

The Salt Syndicate.—The landowners are now being settled with, and by the time this article appears in print it is probable that all arrangements will be so far completed as to allow the prospectus to be issued. As a sop towards the larger buyers, the Syndicate has just issued a circular to them offering them priority of allotment of shares before issuing the prospectus to the public. Thus the outside world will be offered the remnant; and if the prospectus can state, or does state, that a very large proportion of the shares have been already taken up, there will be a run upon them, and the Stock Exchange will do the needful by rapidly running up the shares to a premium for the benefit of the promoters; and if they raise anything like three million sterling for capital, the present owners of the works will receive a great deal more for them than has hitherto been considered relative value to the production of salt per ton and per annum. It has hitherto been understood that the capital value of a salt works has been in about the relation of £1,000. for every one thousand tons of salt made yearly—that is, one pound sterling was capable of turning out one ton of salt at a profit every year, and thus three millions of pounds sterling should make in the same proportion far more salt than has hitherto been made. But the intention is, we are told, to reduce the output, so that the cost of production will be greatly increased by this heavily weighted capital account, doing less work than it is capable of doing under ordinary circumstances. If this is so, then "up must go the quartern loaf."

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN AUGUST.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of August, 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the returns.

(To be concluded.)

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN AUGUST.

(Concluded from page 342.)

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during August, 1923, compared with 1921 and 1922. As from April 1, 1923, export trade of the Irish Free State is excluded from the Returns.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[SPECIALLY CONTRIBUTED.]

Two or three weeks ago iron smelters in Cumberland and the Furness district who use most of the coke that is made in this district were gloomily anticipating a further decrease of output, and it was stated indeed that at least three furnaces would be damped down before the end of this month. To-day it may be said with some confidence that the worst of the depression has passed, and that smelters may look forward to a steady absorption of their output and to the prospect sometime during the winter, though whether before Christmas is as yet uncertain, of an expansion of the make. It is certainly the case that users are regaining confidence and ordering more freely, and there is even a chance in the event of affairs on the Continent taking a more favourable turn that users may begin to place forward contracts. At all events there is a distinct improvement, however temporary it may be, in the position as it affects this district, and coke makers are disposed to believe that all the coke they can produce will be required throughout the winter. Important developments are expected in the coking industry. It is no secret that the Whitehaven Colliery Company, as the new method of working at Haig Pit comes into operation, anticipate that they will be able so to develop the Bannock land as to obtain selected coal from which they can make a coke equal in quality to that of the East Coast and at the same time a good deal cheaper. The importance to the hematite pig-iron smelters on the North-West coast of having at command a coke as low in phosphorus and as hard as that of the East Coast at a figure that will enable the cost of smelting iron to be considerably reduced cannot easily be over-estimated. Of course it will be some time before the plans of the company can be carried to maturity, but the prospect of one at least of the local coking plants furnishing a coke entirely acceptable to the smelter of low-phosphorus iron is exciting keen interest and arresting attention in an area beyond the confines of the hematite pig-iron producing district. Meantime the make of local coke is rising and the whole of the production is being absorbed. The larger part of it is going to the furnaces in West Cumberland and to the Furness district at 29s. to 33s. per ton according to carbon content, and what is left is finding a market on the Continent at 34s. to 37s. per ton, f.o.b. The ovens are taking practically all the small coal, and the Irish market is thus deprived of the nuts and smalls which are so eagerly wanted. Best round coal on the other hand is not in brisk request, though as the Whitehaven Colliery Company is still engaged in filling its Irish yards the shipments across Channel are fairly heavy. In other directions business is on the slow side. House coal is easy at 38s. 2d. at pit and the iron ore mines' needs of best steam at 30s. and of washed steam at 29s. are diminished. Residuals and chemical products are a fairly active market. East Coast coke supplies are 8,200 tons.

NEW COMPANIES.

Ashby Soaps, Ltd.—Private company. Capital £30,000., £1. shares (15,000 7 per cent. A. cumulative preference, 9,000 7 per cent. B. preference, and 6,000 ordinary). Office: 51, Wardwick, Derby.

Briquette Binders, Ltd. — Private company. Capital £30,000. Office: Letricheux Buildings, Swansea.

John Greenhalgh (Vigo Products), Ltd. — Private company. Capital £3,000. Tallow merchants and refiners, etc. Office: 61, Old Broad Street, London, E.C.

Robt. Ingham Clark and Co. (Scotland), Ltd. — Private company. Capital £20,500., in 20,000 7 per cent. participating preference of £1. and 10,000 ordinary of 1s. Manufacturers of paints and chemical products, etc. Address: West Ham Abbey, Stratford, London, E. 1.

T. F. Steele and Co., Ltd. — Private company. Capital £500. Manufacturers and distributors of and dealers in cleansing and polishing compounds, etc. Office: 57, Fenchurch Street, London, E.C.

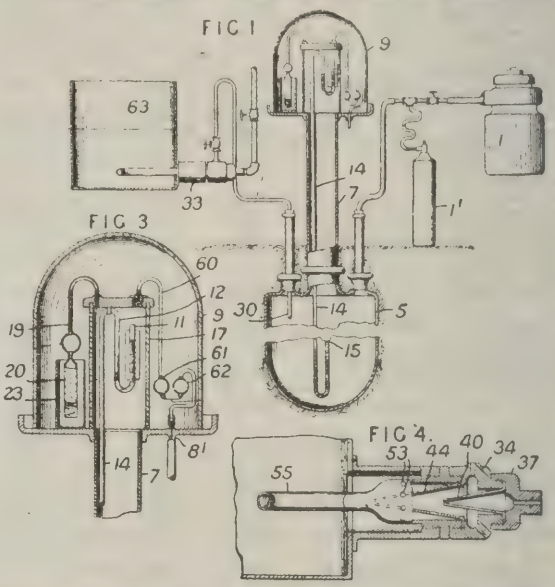
ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Chlorinating Liquids. J. W. van Meter, San Francisco, California, U.S.A. British Patent, **201,214**, of 1922.

Liquids are chlorinated by introducing a mixture of chlorine with steam, air, or other gas, into the liquid by means of a spirally-grooved nozzle which imparts a whirling movement to the mixture of gas and liquid. The chlorine is stored as gas in an underground container which is provided with means above ground for indicating the amount and rate of flow of the chlorine. The underground container 5, Fig. 1, is supplied with chlorine from a still 1 or cylinder 1'; it communicates by a pipe 7 with a glass bell 9 containing the indicating devices, and a pipe 30 with the injector 33 which supplies the gas to the liquid in the container 63. The injector, Fig. 4, comprises a nipple 37 connected to a steam supply and carrying a conical nozzle 40, a casing 34 connected to the chlorine supply and carrying a second conical nozzle 44, and the nozzle 55 which is provided with holes 53 for admission of the liquid, and is spirally-grooved



to give the mixture a whirling movement. The indicating-devices are shown in Fig. 3; the pipe 7 leads into a cup 17 contained in the bell 9; two bulbs 61, 62 containing liquid are connected to atmosphere by a vent 8' and to the cup 17 by a tube 60; the rate of bubbling through the bulbs 61, 62 serves to indicate the rate of flow of the chlorine into or out of the container 5. An additional device for indicating the rate of flow comprises an open-ended graduated cylinder 20, which is immersed in a jar 23 containing liquid and communicates with the cup 17 by pipe 19. The amount of chlorine in the container 5 is indicated by means of a U-tube 11, 12 containing liquid and connected to the leg 14 of the U-tube 14, 15 which extends into the chamber 5 and contains liquid in its lower part.

Apparatus for Gas Analysis. D. M. Macdonald, London. British Patent, **201,408**, of 1922.

In a portable apparatus of the Orsat type for the complete analysis of coal gas and like combustible gases: (1) the burette is centrally placed to reduce errors due to the capillary; (2) the graduation and the dimensions of the burette are selected with a view to enabling a comparatively large portion of the gas to be taken for explosion; (3) both water and mercury are used as confining agents, the explosion occurring over mercury in a vessel having a shape and dimensions stated to reduce the speed of the explosion; and (4) the capillary is of ½ mm. bore.

Fire-Extinguishing Chemicals. L. E. Eckelmann, New York, U.S.A. British Patent, **201,379**, of 1922

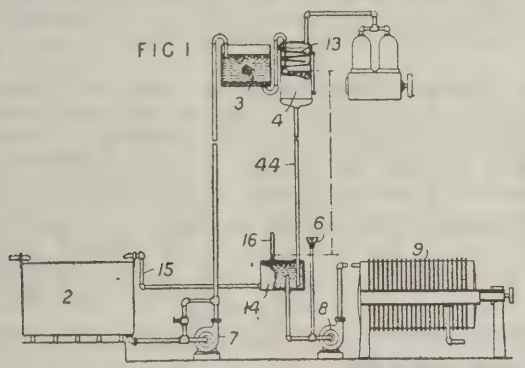
An emulsion formed of a plurality of polychlorinated hydrocarbons of different specific gravities is added to one of the reagents employed in the generation of fire-extinguishing foam, so that the latter is capable of supplying an air-excluding blanket of non-inflammable vapour over the fire, even if itself destroyed by the heat. Carbon-tetrachloride may be employed together with one or more lighter chlori-

nated hydrocarbons and an emulsifier, such as saponin, soap, gum-arabic, etc., and one to three per cent. of light oils may be added to increase the permanency and fluidity of the emulsion. The emulsion is mixed with a foam-producing reagent (such as a solution of aluminium sulphate, to be afterwards mixed with sodium bicarbonate solution), so concentrated as to have a specific gravity approximately equal to that of the emulsion.

Precipitating Metals. E. C. R. Marks, London. (Merrill Company, San Francisco, California, U.S.A.) British Patent, **201,231**, of 1922.

In the precipitation of precious and other metals from cyanide and other solutions, by chemical precipitants, interfering dissolved gases are removed from the solution by means other than heating the solution or by the action of the precipitant itself, for example by chemical or mechanical means. The chemical elimination may be effected by a reducing agent such as sodium sulphide or hydrogen; the mechanical elimination may be effected by exhaustion; and the elimination may be effected prior to or during the precipitation. In the plant shown, solution to be treated is pumped from a tank 2 to a feed tank 3 from which it is drawn by a vacuum pump and caused to pass over baffle-

FIG 1



plates 13 in a vessel 4 connected by a barometric tube 44 to a tank 14 fitted with a stand-pipe 16 and overflow 15. From the tank 14 the solution is pumped to a filter press 9, the precipitant, which may be zinc, being admitted from a hopper 6. The apparatus is so arranged that the pressures existing in the plant prevent the ingress of atmospheric air. In modified forms of plant, the tanks 2, 3 may be so arranged that the solution flows directly from one to the other without the intervention of a pump 7; a tank such as 14 may be dispensed with; the precipitant may be admitted into the vessel 4; or the pump 8 may pass the solution to zinc precipitation chambers instead of precipitant being previously added to the solution, the precipitation chambers being either exhausted or left open to the air, the hydrogen evolved serving in the latter case to prevent reabsorption of interfering gases.

Lead Alkaline-earth Metal Alloys. W. Mathesius, Berlin. British Patent, **200,408**, of 1922.

An alloy of lead with two or more, preferably with three, of the alkaline earth metals, is made by electrolysis of a mixture of the fused salts with a lead cathode. The bath is subjected to a preliminary electrolysis until it attains a constant composition. A mixture of salts in the required proportions is added during the main operation in small portions. The alloy obtained during the preliminary operation may be mixed with that obtained afterwards. Lead may be charged and the alloy discharged continuously.

Camphor. J. Schindelmeiser, Dorpat, Esthonia. British Patent, **201,332**, of 1922.

Camphor is obtained by passing borneol or isoborneol vapour in admixture with air or other oxygen-containing gas over heated "highly active" charcoal. The charcoal is preferably produced by saturating wood charcoal with a solution of potassium carbonate, partially drying, and then calcining the product in the absence of air. The borneol or isoborneol is heated to a temperature near the boiling point in a distilling vessel provided with a tower containing a number of perforated trays supporting the charcoal, and air heated to a slightly higher temperature is then introduced into the liquid. The reaction product passes into a condenser where the camphor separates out.

Purification by Peptisation. A. G. Bloxam, London. (Elektro-Osmose Akt.-Ges. (Graf Schwerin Ges.), Berlin.) British Patent, **200,533**, of 1921.

In the usual process for peptising substances, for example clay, ores, or graphite, by the addition of electrolytes, the latter are so chosen that they eliminate the ions which tend to hinder peptisation, such as calcium or sulphate ions, and thereby a purification of the required substance is effected. In addition to the purifying electrolyte, which may for example be an oxalate or citrate of an alkali metal, of ammonia, or of an organic base, there are preferably present hydroxyl ions, which, in the case where the substance contains sulphate ions, may be added in the form of barium hydroxide. In examples crude kaolin is suspended in water and treated with sodium oxalate solution, and a suspension of clay is treated with sodium oxalate and with barium hydrate. The purified substances may be obtained from their suspensions by known methods. Specifications 6560/09 and 168,927 are referred to. *Reference has been directed by the Comptroller to Specifications* 175,050, 184,271, *and* 186,855.

Protective Coatings on Metals. A. Mai, München, Germany. British Patent, **200,892**, of 1922.

Iron, iron alloys, and steel are treated, to produce a protective layer thereon, in an alkaline bath—*e.g.*, caustic soda, containing an oxidising agent and also slaked lime or other caustic alkaline earth. The oxidising agents may be bichromates, permanganates, nitrates, nitrites, peroxides, chlorates, etc., and also organic oxidising agents—*e.g.*, nitrocellulose, nitrophenol, nitrotoluol, or organic peroxides. The bath is employed at temperatures of 120°–130° C. or higher, such as 180°–200° C., the treatment at higher temperatures and with more concentrated baths occupying less time than the treatment at lower temperatures. The oxidation and colouration of the metal surface takes place more rapidly if small quantities of decomposition products of the oxidising agent are added to the bath at the beginning of the operation. The same result may be obtained by adding small quantities of an iron salt—*e.g.*, ferric nitrate. Brighter colours are obtained if the metal is first provided with a preliminary protective coating—*e.g.*, by immersion in dilute copper sulphate solution or by heating in air. The bath subsequently employed is preferably concentrated and employed at 180°–200° C. On removal from the bath, the objects may be immersed in dilute acetic acid or other liquid to dissolve any adhering lime, and then washed in water, dried, and lacquered, varnished, or oiled.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Cellulose Carboxylates. Soc. de Stéarinerie et Savonnerie de Lyon, Lyons, France. British Patent, **201,510**. Convention date, July 29.

Cellulose esters of organic acids containing more than five atoms of carbon such as capric, caproic, caprylic, lauric, myristic, palmitic, and stearic acid, or saturated cyclic acids such as naphthenic acids are obtained by condensation of cellulose with the acid or a derivative of the acid such as the acid chloride or anhydride. An acid chloride is preferably used with the addition of an organic base such as pyridine or quinoline; and an acid anhydride with the addition of a dehydrating agent such as melted zinc chloride. Diluents may be such as chloroform, carbon tetrachloride, halogen derivatives of acetylene, or benzine. According to the proportions used monoesters, diesters, or triesters of cellulose are formed, the two latter being soluble in the diluents mentioned while the monoesters are insoluble. The esters are soluble in many organic solvents, and in particular in the aromatic hydrocarbons. The solutions yield on evaporation colourless and transparent pellicles without the addition of plasticising substances. Specifications 22029/98, 20977/11, and 20978/11 are referred to.

Cyanamide as Vulcanisation Accelerator. D. J. Chatelan, Lausanne, Switzerland. British Patent, **201,570**. Convention date, July 28, 1922.

An accelerator for the vulcanisation of rubber consists of cyanamide or dicyandiamide. By adding an amount of dicyandiamide equal to the sulphur present, the time of vulcanisation is reduced to half that required when using sulphur alone.

SOUTH WALES NOTES.

[SPECIALLY CONTRIBUTED.]

The tone of the tinplate trade is better, but buyers do not seem anxious to place any large orders. It is considered that a reduction in prices should be made, but as manufacturers intend to continue business at present quotations until the end of the year, merchants are not inclined to enter into contracts over a prolonged period and are content to buy from month to month. The patent fuel trade is in a better condition and some large export business is being transacted. This week a cargo of over 6,000 tons of pitch from Pensacola arrived at Swansea. The efforts made to render this pitch suitable for binding purposes have so far proved very successful. Deposits of limonite have been discovered in the village of Ystrádfellte and further investigations are being made. Negotiations are in progress for establishing a new cement works at Portskewelt entailing an expenditure of several thousand pounds. The spelter trade is fairly satisfactory. The well known Emu works which have been idle for many years are about to restart. Cokes have a quieter market, and as the production is on the increase prices have given way a little. Stocks are accumulating, but with the approach of winter the demand is bound to increase and there does not seem any likelihood of a reduction in the number of ovens now operating. By-products are selling very satisfactorily. The galvanised trade is much better, the demand from Argentina increasing of late, while quantities shipped to the Phillippines are of greater volume.

Among the imports for the week were 25 tons calcined magnesite from Hamburg, 300 tons gypsum from Rouen to Cardiff; 162 tons copper ore, 10 tons ferro phosphorus from Hamburg, 4,800 tons sulphur from Licate, 2 tons copper precipitate from Carthagena, 6,000 tons pitch from Pensacola, and 49cwt. tin oxide from Antwerp to Swansea; 40 tons cement from Hamburg to Newport. Included in the exports from Cardiff were 1,887 tons creosote oil to Savannah and 493 tons sulphate of ammonia to Dunkirk.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. WEDNESDAY.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—This market keeps fairly steady, although business is still rather poor in volume. Some few slight reductions in prices are recorded, but there is no general movement in this direction. **Acetic Acid,** 80% technical, £47.; 80% pure, about £50.; 98% glacial, £60. in casks, and £75. in glass demijohns, ex wharf London; the spot position keeps very steady, with good inquiry on hand. **Acetone,** British Government specification, £125. to £127. per ton, in drums; the spot position holds well up to this level, and business has been good. **Alum,** lump, in casks, £10. to £10. 10s. per ton; dealers continue to offer at these rates, but are doing but small business. **Arsenic,** Cornish white powdered, about £62. per ton, f.o.r. Cornwall; prices are much lower this week, but, in view of an improvement in the American market, a recovery is expected here. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; inquiry is now poor, and dealers' prices are unaltered. **Barium Chloride,** 98—100%, about £14. 10s. to £15. per ton; slightly easier prices are being quoted by dealers, but business remains poor. **Bleaching Powder,** 35—37%, about £10. to £10. 10s. per ton; dealers' prices are level on the week, with the demand slow. **Borax,** commercial, granulated £24. 10s., crystals £25., powdered £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are unchanged; dealers are quoting under similar conditions at—commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers continue to quote at these prices for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; dealers are offering some grades at competitive rates. **Cream of Tartar,** 99—100%, about 88s. per cwt., less 2½%; at this price the spot position is fairly steady, and some business has been done. **Citric Acid,** B.P., about 1s. 5d. per lb., less 5%; there seems to be hardly any demand for this article, and spot holders who have been trying to clear out have had difficulty in getting any bids. **Epsom Salts,** commercial quality, about £4. 10s. to £5. per ton; dealers are offering some spot parcels at these lower rates, but there is no improvement in demand so far. **Formaldehyde,** 40%, about £73. to £75. per ton; the position is rather easier this week, but the market now seems quite steady. **Glauber's Salt,** commercial quality, about £3. 15s. to £4. per ton, in bags; dealers offering at these rates find business very slow. **Lead Acetate,** brown, about £41.; white, about £42. per ton; dealers' prices, which are generally based on Continental offerings, are somewhat firmer this week. **Litharge,** about £35. 10s. to £36. per ton; dealers' prices keep steady at these prices, with business quiet. **Lithopone,** 30% Continental red seal, about £22. to £22. 10s. per ton; importers offerings are a little lower this week, with a fair volume of business being done. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; spot material is steady at this rate, although the demand is rather slow. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at about these prices. **Oxalic Acid,** about 6d. per lb.; inquiry remains poor, with the price maintained, but the market is not at all steady. **Carbonate of Potash,** 90—92%, £26. to £27.; 96—98%, about £29. per ton; dealers' prices have been reduced, and the market is now steady, but business remains poor. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; this market is still dull, with quoted rates unchanged. **Caustic Potash,** 88—92%, about £31. to £31. 10s. per ton; dealers' prices for spot material seem to

be well maintained at these better rates. **Permanganate of Potash,** commercial quality, about 9½d. per lb.; if anything, the spot position is a shade easier at the rate quoted. **Prussiate of Potash,** yellow, about 1s. per lb.; dealers are very steady at this figure, and business has been a little brighter. **Sulphate of Potash,** 90%, £11. 10s per ton, ex ship; there is no change on the week. **Mercury,** about £9. per bottle of 75—76lb.; this market remains quiet, with quoted rates rather unsteady. **Red Lead,** imported, about £35. 10s. to £36. per ton; dealers are doing a fair business at about these prices. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white crystals, £25. to £26. per ton; spot holders' prices are much steadier this week, and something in the way of an advance is expected. **Saltcake,** ground and unground, home trade, about £4. per ton; export, about £5. 5s. per ton, f.o.b.; this market is steady, with inquiry sustained. **Acetate of Soda,** about £24. to £24. 10s. per ton; dealers are offering at slightly cheaper rates this week. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers' prices are maintained at these levels, with little good business about. British makers' prices, for home trade only, are unchanged at: 70—72%, £16. 17s. 6d.; 76—77%, £18. 7s. 6d. per ton, in drums, carriage paid in Great Britain; makers' prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers quoting at this price, for home trade only, in free bags, carriage paid to destination. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers' price shows no change. **Cyanide of Soda,** 98—100%, export, 8½d. to 9d. per lb.; British makers' prices are maintained at these levels **Hyposulphite of Soda,** pea crystals, about £14. to £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £9. per ton, in casks; dealers offering at these rates for spot supplies; c.i.f. offers are under these figures. **Nitrate of Soda,** 96%, £13. 5s. per ton, f.o.r. or f.o.b.; there is no change to report; market steady. **Nitrite of Soda,** 100%, about £26. 10s. per ton; the position keeps very steady at this unaltered price. **Prussiate of Soda,** about 6d. per lb.; dealers are still offering at this figure, but business is slow, and generally the market is not firm. **Sodium Sulphide,** 60—62% solid, about £14.; do., broken, about £15. 5s. per ton, in drums; dealers quoting at these prices, with not much business about. **Sulphate of Copper,** on spot, about £25. 10s. per ton; the demand is still slow and small, with prices rather unsteady. **Tin Crystals,** about 1s. 4d. per lb.; the market is unchanged on the week. **Tartaric Acid,** B.P., crystals, about 1s. 1¾d. per lb., less 5%; the spot position is very unsatisfactory, with supplies heavy, and the demand persistently poor; any sales would be well under the nominal price quoted above. **White Lead,** imported, about £42. per ton; dealers offering at about this figure are doing some moderate business. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers report there is no change in their prices.

Pharmaceutical Chemicals.—A fairly steady tone continues to govern this market, and once more there is little change to report. Business is certainly being done, but most of it is for small quantities. **Acetanilid,** crystals and powder, 1s. 7d. to 1s. 8d. per lb.; this market is firmer, with prices advanced. **Acetyl-Salicylic Acid,** B.P., about 3s. 1d. per lb.; supplies on spot seem short, and the price quoted is now firm. **Benzoic Acid,** B.P., 2s. 3d. to 2s. 6d.; inquiry remains very light; quoted rates unchanged. **Diethylbarbituric Acid,** B.P. (barbitone), about 17s. per lb.; no further decline in value is recorded; demand slow. **Salicylic Acid,** B.P., about 2s. 3d. to 2s. 4d. per lb.; the market has kept steady at these rates, and some fair business has been done. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; the market is unchanged, with little doing. **Amidopyrin,** about 14s. 6d. per lb.; inquiry is only occasional; spot price unchanged. **Ammonium Bromide,** about 7d. per lb.; some few small orders have been booked at about this figure on spot. **Benzonaphthol,** about 5s. per lb., nominal; market remains idle. **Betanaphthol,** resublimed, 1s. 10d. to 2s. per lb.; sales have been slow and small, with values rather easy. **Benzaldehyde 03,** about 3s. per lb.; the market keeps steady at this figure, but the demand is poor. **Calcium Lactate,** about 1s. 9d. per lb.; some slightly cheaper offers of large quantities are on the market. **Chloral Hydrate,** duty paid, about 4s. per lb.; spot offers are at about this rate, with not much demand. **Creosote, B.P.,** about 2s. 6d. per lb.; the market is steady, but not at all active. **Creosote Carbonate,** about 8s. 6d. per lb.; inquiry has been very poor; quoted rates unaltered. **Guaiacol Carbonate,** about 8s. 3d. per lb., nominal; no business recorded. **Hexamine,** about 3s. 6d. to 3s. 9d. per lb.; the position on spot is fairly steady, but business continues to drag, and is small in size. **Hydroquinone,** about 3s. 6d. per lb.; the spot position is firmer on account of dearer offers from the Continent; demand on spot small. **Methyl Salicylate,** 2s. 6d. to 2s. 6d. per lb.; prices quoted on spot are inclined to be firmer, while business is fairly good. **Methyl Sulphonal,** about 15s. per lb.; this item remains neglected, with quoted rates unaltered. **Paraformaldehyde,** about 3s. 6d. per lb.; the tone is steadier on spot after last week's easier rate, but business is poor. **Paraldehyde,** 1s. 5d. to 1s. 6d. per lb.; there is little offering on spot below these prices. **Phenacetin,** about 6s. 1d. to 6s. 3d. per lb.; prices are a little better this week. **Phenazone,** 7s. 3d. to 7s. 6d. per lb.; most offers on spot are at these rates, with the demand slow. **Phenolphthalein,** 6s. 6d. to 6s. 9d. per lb.; at these prices the spot market is quite steady. **Potassium Bromide,** B.P., crystals and granular, 6d. to 6½d. per lb.; prices of spot offers vary, with demands light; the market is unsteady. **Potassium Permanganate,** B.P., about 9½d. per lb.; the spot market is a shade easier this week, but is now quite steady. **Potassium Sulphoguaiacolate,** 5s. 6d. per lb.; little or no inquiry being received; quotations unchanged. **Resorcin,** about 5s. 9d. per lb.; some slightly cheaper offers have been made, with business slow. **Salol,** about 2s. 9d. per lb.; at this price the spot position is easy and unsteady. **Sodium Benzoate,** about 2s 6d. per lb.; nominal; no inquiry on the market. **Sodium Bromide,** B.P., crystals and granular, about 7d. to 8d. per lb.; slightly better prices are being quoted for this product, and some little business has been done. **Sodium Salicylate,** powder, about 2s. 5d. to 2s. 6d.; crystals, about 2s. 7d. to 2s. 8d. per lb.; holders of spot supplies are firm in their offers, and inquiry has been good. **Sulphonal,** about 14s. 6d. per lb.; quoted nominal on an idle market. **Terpin Hydrate,** about 1s. 9d. per lb.; a steady but quiet market. **Thymol,** about 15s. per lb.; this market has been quiet, but spot holders' prices are unchanged.

Coal-tar Products, Intermediates, Etc.—A number of changes of importance are recorded here, with the market still dull throughout. Pitch is again easier. Pure methyl alcohol has dropped sharply. Hexamethylene is cheaper. Pyridine is a shade dearer. **Aniline Oil,** about 9d. to 9½d. per lb., drums free; the market remains dull, with quoted values unchanged. **Aniline Salt,** 9½d. to 10d. per lb., casks free; business remains poor, with prices unaltered. **Betanaphthol,** about 1s. 1d. to 1s. 2d. per lb.; the demand has been slow, with quoted rates level. **Benzol,** about 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; makers are quoting at this unchanged price, but a slight decline is looked for at an early date. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; makers' quoted price is steady, with very little business about. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; dealers' offers are at these prices, with little business about. **Naphtha,** about 1s. 4d. per gallon; at this rate the market is easy and dull. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; the market is steady at these recently reduced rates, but there is little doing. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; the demand has been slow, with quoted rates steady. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; this market keeps very steady, although on the quiet side. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; quoted at the old rates, with business quiet. **Creosote Oil,** about 9½d. per gallon, f.o.b.; merchants are offering at this price, with business restricted. **Carbolic Acid,** crystals, about 1s. 2d. per lb., f.o.b.; at this price the position seems steady, and inquiry is being dealt with. **Naphthalene,** about £19. 10s. to £20. per ton; after the recent slight weakening the market is steadier, but there is not much doing; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; candles, £28.; tablets, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; this market remains dull, with quoted prices unchanged. **Pyridine,** about 21s. per gallon; a further advance in price is recorded, with the position still firm, and still higher prices not unlikely. **Hexamethylene,** about 3s. 6d. per gallon; at this reduced price the spot position is dull and rather easy. **Pure Methyl Alcohol,** about £90. per ton, ex wharf London, in drums; dealers have made a sharp reduction in their price, and the market is now steady. **Pitch,** about 125s. per ton, f.o.b. East Coast; the market has sustained a further fall in price, and remains dull and rather weak.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £63. 5s. to £63. 7s. 6d., cash; £63. 12s. 6d. to £63. 15s., three months; electrolytic, £67. 10s. to £68. **Tin**: Standard, £200. 5s. to £200. 7s. 6d., cash; £200 5s. to £200. 7s. 6d., three months; Straits, £203. 15s.; English, £201. **Lead**, soft foreign, £26., prompt; English, £27. 5s.; chemical sheet, 34s. per cwt. for 2-ton lots, delivered. **Spelter**, prompt, £33. 17s. 6d.; hard, £27. 10s. **Antimony**, English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium**, 98—99%, £115.; foreign, £110., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 5s. **Bismuth**, 10s. **Platinum**, 500s. per oz. **Wolfram**, spot, 12s. 3d. to 12s. 6d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 90—92%, £47. 10s. per ton, delivered; Beaver brand, 90%, £47 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand for heavy chemicals during the past week has been on the small side, and business transacted is only for spot and near requirements. Values, as a whole, continue in buyers' favour, and, with few exceptions, prices have a downward tendency. In the alkali trade, quotations are maintained at recent rates with the exception of **58% Alkali**, the spot price of which is reduced to £7. 10s. on rails as from October 1. **Bleaching Powder** continues dull at £11. 5s. on rails for soft wood casks. **Roasted Saltcake**, unchanged at £4. 10s., carriage paid. **Glauber's Salt** continue easy at £4. per ton, carriage paid. Imported American **Sulphur**, firmer at £5. 7s. 6d. on rails, and there is a fairly good inquiry. **Chlorates** are only moving off slowly, **Potash** at 3d., and **Soda** 2¾d. per lb. **Bichromates** unaltered. **Copper Sulphate** is in small request, and price remains nominal at £25. 10s. to £26., f.o.b. **Phosphate** and **Commercial Hyposulphite of Soda** are neglected. **Nitrite of Soda**, steady at £26. 10s., ex store. Concentrated **Sodium Sulphide**, dull at £14., carriage paid; crystals, £9. per ton. White powdered Cornish **Arsenic** is again lower at £62., on rails at works, with only small inquiry Yellow **Prussiates** are lower; **Potash** at 1s. 0½d., and **Soda** 5½d., per lb., carriage paid. **Carbonate of Potash**, 88—90%, easy at £25., c.i.f. Solid **Caustic Soda**, 88—90%, firm at £29. per ton. Grey and brown **Acetate of Lime** are unchanged in position or value, and supplies continue scarce. **Acetic Acid** and **Acetate of Soda** steady. **Lead Salts** are slightly easier; white **Acetate** £41., brown £42.; and **Lead Nitrate** £42. per ton, delivered. Miscible **Wood Naphtha**, quiet at 6s. 6d. per gallon. **Acetone** firm at £127. per ton. **Barium Chloride**, slow of sale at £15. 10s. per ton. **Oxalic Acid**, quiet at 5¾d. per lb. **Permanganate of Potash**, commercial quality, lower at 9d., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

Tinplates were very steady on the fixed basis of £1. 3s. 1½d. per standard box f.o.b. **Galvanised Sheets** continue to be steady, with fair quantity of business transacted at £18. 17s. 6d. per ton. **Copper** easier at £63. 2s. 6d. per ton prompt, and £63. 12s. 6d. three months. **Tin** quiet and irregular, with prompt at £199. 17s. 6d. per ton, and three months £200. 7s. 6d. **Lead** firm and dearer, with foreign at £25. 12s. 6d. per ton prompt, and £25. 7s. 6d. forward; English, £27. per ton. **Spelter** rather easier at £33. 12s. 6d. per ton cash, and £33. 15s. 6d. forward. **Zinc Sheets** in fair demand at £39. 12s. 6d. per ton. **Sulphate of Ammonia** quiet at fixed home-trade prices. **Sulphate of Copper** dull at £26. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda** quiet, with prompt 13s. 6d. per cwt., in bags; forward slightly higher. **Bone Meal** slow, with Ceylon at £9. 2s. 6d. per ton. **Oxalic** showed no improvement at 6¼d. per lb., f.o.r. **Copperas** dull at £2. 2s. 6d. per ton, delivered London or equal. **Arsenic** in better inquiry at £69. 7s. 6d. per ton for white powdered. **Sulphuric Acid** in good demand. **Pitch** showed lower quotations, but little business done at £6. 2s. 6d. per ton at docks. **Rape Oil** steady, with refined, prompt, at £2. 3s 3d. per cwt. **Cod Oil** quiet; Newfoundland £2. 2s. 3d., and English, prompt, £1. 14s. 3d. per cwt., f.o.b. **Linseed Oil** firmly held, with raw at £2. 5s. 3d., and boiled £2. 7s. 3d. per cwt., net, in barrels. **Cottonseed Oil** in good demand; common edible £2. 3s. 3d., and deodorised £2. 6s. 3d. per cwt., net. **Coconut Oil** very firm, with Ceylon at £2. 4s. 3d. per cwt. **Olive Oil** quiet, with prompt at £63. 17s. 6d. per ton. **Palm Oil** rather quiet; Lagos, prompt, £36. 17s. 6d.; softs, £36. 2s. 6d.; mediums, £36. 12s. 6d.; and hards, £36. 17s. 6d. per ton. **Benzol** in strong demand, with unaltered rates. **Turpentine** steady, with American prompt at £3. 17s. 3d. per cwt. **Coal** in much better supply: Best Admiralty smokeless, £1. 8s.; seconds, £1. 6s. 6d.; ordinaries, £1. 6s.; Monmouthshire black vein, £1. 7s. 6d.; smalls, £1. 2s., down to 18s. per ton, all f.o.b. **Cokes** in better demand; export, £2. to £2. 7s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in truck, at ovens. **Anthracite**, best, was firm, but for lower grades prices eased; best large, £2. 10s.; seconds, £2.; French nuts, £3. per ton, all f.o.b. **Patent Fuel**, quiet at late rates.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Inquiries for chemicals of the heavier class for use in the home branch of the trade have been fairly numerous, the general demand being steady and of fair aggregate volume. In the export branch shipments have been moderately active. **Bleaching Powder** has been steadily called for, and is £10. 5s. to £10. 7s. 6d. per ton for the home trade, and £11. 5s. to £11. 17s. 6d. per ton for export. **Chloride of Calcium** has been quieter, and is £5. 12s. 6d. per ton. **Caustic Soda** has been in rather good request for use in the United Kingdom, and has had a very fair shipment to overseas ports; the price is £19. to £20. per ton for 76%, carriage paid, for the home trade. **Bicarbonate of Soda** has again had a fairly free sale for home-trade uses, and has been shipped on a rather large scale; it is £10. 10s. per ton, carriage paid, for the home trade. **Soda Crystals** have been more in request for use in the United Kingdom, but continue quiet in the export branch; the price is £5. 5s. per ton, for use in the United Kingdom, carriage paid. **Nitrate of Soda** has had a moderate sale, and is £13. 5s. to £13. 10s. per ton. **Borax** has been more in request for the home trade and on export account; commercial crystals are £25. per ton, and powdered £26.; higher-grade crystals are £29. per ton, and powdered £30.; superfine is £31. per ton. **Saltcake** has again been in good demand, and is £4. 10s. to £5. per ton for home-trade use, and £5. to £6. per ton for export. **Bichromate of Soda** continues in very fair demand; it is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has been steadily called for on home-trade account, and has had an active shipment for export; it is £7. 12s. 6d. per ton for the United Kingdom, and £8. per ton for overseas, the export price varying according to destination. **Hyposulphite of Soda** has had a fair sale, and is £10. to £11. per ton, in 2cwt. bags, for commercial; and £15. to £17. per ton for photographic quality, in 1cwt. kegs. **Sulphide of Soda** has been quiet; solid is £14. 10s. to £15. per ton, and crystals £8. 10s. to £9. per ton. **Chlorate of Soda** has moved but slowly, and is 3d. to 3½d. per lb. **Phosphate of Soda** continues quiet, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been but little in demand, and is 6½d. per lb. **Yellow Prussiate of Potash** has been in fair demand, and is 1s. 1d. per lb. **Red Prussiate** has been rather more in request, and is 3s. per lb. **Carbonate of Potash** has been in quietly steady demand, and is £25. to £31. per ton, according to quality. **Nitrate of Potash** has been more in request, and is £29. to £30. per ton. **Chlorate of Potash** continues quiet, and is 3½d. to 4d. per lb. **Caustic Potash** has had a steady sale, and is £29. to £30. per ton. **Permanganate of Potash** continues to meet with a very fair inquiry, and is 9½d. to 9¾d. per lb. **Bichromate of Potash** has been steadily called for, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been rather more in demand; first quality is £60. per ton, and second quality £57. per ton. **Sulphate of Ammonia** has been quiet on home-trade account, but has been shipped largely for foreign ports: neutral of 25¾% is £14. 10s. per ton, and ordinary of 25¼% £13. 7s. per ton, for use in the United Kingdom. **Carbonate of Ammonia** has been in rather good request, and is 4d. per lb. **Muriate of Ammonia** has been in moderate demand; grey is £32. per ton. **Magnesia** has sold somewhat freely; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been in quietly steady demand; for the home trade £12. per ton is the price, and for export £11. to £11. 10s. per ton. **Sulphate of Alumina** has been in fair request; it is £8. to £10. 10s.

per ton, according to quality. **Sulphur** has had a rather free sale; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s., and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has been steadily called for, and is 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has sold with some freedom, and is £4. 10s. per cwt. **Boric Acid** has been rather more in request; commercial crystals are £48. per ton, and powdered £51. per ton, and £2. more per ton if in casks. **Citric Acid** continues quiet, and is 1s. 6½d. to 1s. 7d. per lb. **Oxalic Acid** has been but little in request, and is 6d. per lb. **White Acetate of Lead** has had a very limited sale, and is £42. to £43. per ton. **Sulphate of Copper** continues quiet for use in the United Kingdom, and has had a light shipment for export; the price is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been in fair request; the price is materially lower, £63. per ton now being taken for white powdered.

WEST OF SCOTLAND CHEMICALS. WEDNESDAY.

There are signs of a little more activity in this market, and the day-to-day demand on home account has been well maintained during the week. Fresh inquiry on export account continues to be limited, however, though there is a fair trade passing in several lines. Prices generally are steady, and quotations, net at Glasgow, are as follows:—**Alum**, lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic**, white powdered, lower at £72. per ton on spot; new supplies coming in are round about £70. per ton; a quiet market. **Barium Chloride**, £15. per ton; this figure is unchanged, and there is nothing of interest to record. **Bleaching Powder**, quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under these figures. **Boric Acid**, crystals, £48. per ton, makers' prices; demand rather poor. **Borax**, crystals, fairly steady at the recently reduced figure of £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride**, 70—75%, solid, £5. 12s. 6d. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid**, 1s. 6d. per lb., less 5%; little business about at last week's easier quotation. **Copper Sulphate**, £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar**, £4. 4s. per cwt. for 99% at Glasgow; quotation unchanged, and inquiry small. **Lead Acetate**, white, £41. 10s. per ton on spot; brown, more inquiry at £42. 10s. per ton; Continental material offering at cheaper rates. **Magnesium Chloride**, £3. 7s. 6d. per ton, ex store; a rather better tone is noticeable in this market, although foreign supplies now arriving are quoted at under this figure. **Oxalic Acid**, quiet at about 6½d. per lb.; little doing at this figure. **Paraffin Wax**, 2½d. per lb.; a steady export trade. **Potassium Bichromate**, 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate**, lower at 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate**, 1s. 2½d. per lb.; this is a dull market, in spite of the reduction of ½d. on the week. **Salammoniac**, first and second lump, £60. and £57. per ton respectively; crystals, £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre**, £1. 11s. per cwt., net; a better market, with quotation still rising. **Sodium Bichromate**, 4½d. per lb.; unchanged. **Sodium Chlorate**, 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate**, 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate**, £9. 15s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic**, 43—44%, 1s. 1d. per lb.; rather easier in tone, and inclined to be dull. **Tartaric Acid**, 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

Antwerp, 10 c., £42.; Cape Town, 230 t. 7 c., £11,003.; Copenhagen, 3 t. 2 c., £207.; Delagoa Bay, 75 t., £6,375.; Kobe, 55 t. 7 c., £4,331.; Melbourne, 3 c., £15.; Pt. Elizabeth, 1 t., £94.

GUANO (FISH)—
Teneriffe, 10 t., £135.

HYDROFLUORIC ACID—
Bahia, 3 c., £18.; Beira, 5 c., £12.

IODOFORM—
Penang, 2 qr., £60.

IRON PERCHLORIDE—
Quebec, 1 t., £20.

LEAD NITRATE—
Fremantle, 2 t. 10 c., £103.

MAGNESIA—
Marmagoa, 5 c., £40.
Rosario, 5 c., £37.

MAGNESIA (CALCINED)—
Lisbon, 2 qr., £15.

MAGNESIUM CARBONATE—
Bombay, 1 t., £38.; Brisbane, 1 t., £14.; Calcutta, 2 t., £66.; Valparaiso, 3 c., £12.

MAGNESIUM CHLORIDE—
Rangoon, 2 t. 5 c., £19.

MAGNESIUM SULPHATE—
Beira, 10 c., £5.; Bluefields (Nicaragua), 5 c., £6. 15s.; Cartagena (Col.), 2 t. 3 c., £32. 10s.; Champerico, 6 c., £4. 5s.; Duala, 3 c., £3. 5s.; Durban, 5 c., £3.; Demerara, 1 t., £7.; Falklands, 1 qr., £1.; Karachi, 14 c., £22.; Koko, 1 c. 2 qr., £1. 10s.; Kingston, 1 c., £1. 5s.; Pt. Harcourt, 7 c., £9.; St. Johns (N.F.), 1 c., £1. 5s.

METHYL ALCOHOL—
Calicut, 2 qr., £17.

NAPHTHA (WOOD)—
Durban, 1 t. 15 c., £159.

NICKEL SULPHATE—
Buenos Ayres, 2 t. 3 c., £84.

NITRIC ACID—
Beira, 12 c., £35.

PHOSPHORIC ACID—
Hobart, 2 t., £210.

PHOSPHORUS (AMORPHOUS)—
Durban, 1 t. 7 c., £318.

PITCH (*otherwise undescribed*)—
Antwerp, 10 t. 2 c., £183.

POTASSIUM BICHROMATE—
Alexandria, 12 t., £575.

POTASSIUM CITRATE—
Bombay, 3 c., £45.

POTASSIUM CYANIDE—
Buenos Ayres, 6 c., £60.
Lagos, 2 qr., £21.
Montreal, 9 c., £59.

POTASSIUM IODIDE—
Accra, 1 c. 2 qr., £42.; Duala, 37½lb., £40.; Penang, 2 qr., £46.

POTASSIUM PRUSSIATE—
Hamburg, 10 t. 1 c., £1,136.
Oporto, 8 c., £58.
San Francisco, 1 t. 2 c., £120.

SALAMMONIAC—
Singapore, 9 c., £26.

SALTPETRE—
Bahia, 1 t., £48.

SHEEP DIP—
Algoa Bay, 3 t. 16 c., £289.; Bombay, 5 c. 2 qr., £52.; Buenos Ayres, 29 t. 5 c., £1,554.; Brisbane, 2 t. 7 c., £87.; Commodoro Rivadavia, 18 t. 13 c., £1,225.; Durban, 11 t. 14 c., £818.; Napier, 2 t. 7 c., £87.; Puerto Deseado, 11 t. 14 c., £437.; Punta Arenas (Chile), 3 t. 7 c., £223.; Puerto Colombia, 4 c., £20.

SHEEP DIP—
Pt. Stanley, 7 t. 17 c., £477.
Santa Cruz (Arg.), 4 t. 9 c., £375.

SUPERPHOSPHATE—
Las Palmas, 9 t. 15 c., £63.

SUPERPHOSPHATE (BONE)—
Orotava, 5 t., £33.

TANNING MATERIALS—
Unspecified
Algoa Bay, 7 t. 14 c., £145.; Antwerp, 11 t., £307.; Auckland, 1 t. 13 c., £103.; Cape Town, 10 t. 2 c., £176.; Copenhagen, 3 t. 8 c., £77.; Durban, 1 t. 2 c., £23.; Dantzig, 2 t., £121.; East London, 13 c., £17.; Hamburg, 4 t., £257.; Melbourne, 2 t. 11 c., £80.; Mossel Bay, 10 t. 4 c., £179.; Stavanger, 2 t., £64.

TARTARIC ACID—
Adelaide, 2 t., £252.; Fremantle, 2 c., £13.; Melbourne, 3 t., £379.; Rangoon, 3 c., £34.; Sydney, 1 t., £124.; St. Johns (N.F.), 2 c., £20.

TIN OXIDE—
Buenos Ayres, 4 t., £850.
Kobe, 14 c., £170.

WOOD PRESERVATIVE—
Algoa Bay, 18 c., £31.
Talcahuano, 1 t. 14 c., £34.

ZINC CHLORIDE—
Shanghai, 3 t., £84.

ZINC OXIDE—
Hamburg, 1 t., £76.

Week ending September 21.

CALCIUM CHLORATE—
Brisbane, 38 pkgs.
Melbourne, 70 pkgs.

CAUSTIC POTASH—
Alexandria, 41 drms.

CAUSTIC SODA—
Aarhus, 15 drms.: Antofagasta, 28 drms.; Adelaide, 170 drms.; Arica, 24 drms.: Bari, 17 drms.; Batavia, 30 drms.; Belawan, 30 drms.; Beyrout, 25 drms.; Bombay, 25 drms.; Brisbane, 32 drms.; Calicut, 110 pkgs.; Christiania, 105 pkgs.: Callao, 18 drms.; Cannanore, 50 drms.; Carupano, 21 pkgs.: Cochin, 100 pkgs.; Durban, 98 drms.; Corral, 50 pkgs.; Fremantle, 59 cs.; Genoa, 5 drms.; Hamburg, 508 drms.; Helsingfors, 240 drms.; Hong Kong, 84 drms.; Jaffa, 35 drms.; Karachi, 100 drms.; Kobe, 1,835 drms.; Lagos, 40 drms.; La Guaira, 73 pkgs.; Melbourne, 50 cs., 155 pkgs.; Monte Video, 100 drms.; Newcastle, 90 drms.; Oporto, 34 drms.; Pt. DYESTUFFS (ARTIFICIAL)—
Nigrosine
Perth, 1 cs., £10.
Unspecified
Auckland, 3 pkgs., £23.; Dunedin, 1 kg., £20.; Genoa, 37 pkgs., £150.; Jamaica, 3 cs. (pt.), £24.; Melbourne, 4 pkgs., 4 cs., £612.; New York, 1 cs. (pt.), £8.; Sydney, 3 pkgs., £53.; Wellington, 2 kgs., £33.

ETHER—
Canton, 6 cs., £25.; New York, 1 cs., £7.; Singapore, 2 cs., £9.

ETHYL CHLORIDE—
Auckland, 1 cs., £9.
Durban, 1 c., £15.

FERTILISERS (*otherwise undes.*)
Brisbane, 6 c., £40.; Channel Islands, 15 t., £108.; Demerara (F.), 68 t. 14 c., £1,116.

FORMALDEHYDE—
Shanghai, 1 ck., £23.

GALLIC ACID—
Calcutta, 1 cs. (pt.), £5.

GLYCERINE—
Buenos Aires, 2 c., £12.; Calcutta, 1 cs., £7.; Canton, 4 c., £19.; Comodoro Rivadavia, 1 c., £6.; Jamaica, 1 c., £8.; New York, 2 c., £16.

HYDROCHLORIC ACID—
Bahia, 7 c., £18.; Colombo, 7 c., £8.; Durban, 12 c., £21.; Madras, 10 c., £49.; Pt. Said, 3 c., £7.

HYDROCYANIC ACID—
Calcutta, 1 cs., £15.

HYDROFLUORIC ACID—
Shanghai, 1 cs., £6.; Singapore, 1 cs., £6.; Tokio, 2 cs., £29.

HYDROGEN PEROXIDE—
Colombo, 5 cs., £38.; Melbourne, 5 cs., £38.; Singapore, 3 cs., £10.

HYPOPHOSPHOROUS ACID—
New York, 6 crbys., £72.

IODIDES (*otherwise undescribed*)—
Calcutta, 1 cs. (pt.), 1 cs., £121.
Hong Kong, 1 cs. (pt.), £37.

IODINE—
Antwerp, 2 cs., £207.; Calcutta, 2 cs. (pt.), £52.; Melbourne, 1 cs., £54.

IODINE (RESUBLIMED)—
Adelaide, 1 cs. (pt.), £53.; Bombay, 2 cs., £216.; Genoa, 3 cs., £310.; Lyttleton, 1 cs., £27.; Melbourne, 1 cs., £27.; Perth, 1 cs (pt.), £26.

IRON AMMONIUM CITRATE—
Madras, 1 cs., £7.
Montreal, 4 cs., £72.

IRON PERCHLORIDE—
Bangkok, 3 cs., £121.

IRON PHOSPHATE—
Shanghai, 1 cs., £18.

IRON SULPHATE—
Bombay, 8 cks., £28.

KIESELGUHR—
Rio de Janeiro (F.), 14 c., £13.
Santos (F.), 12 c., £10.

LEAD ACETATE—
Alexandria, 2 cs. (pt.), £9.; Callao, 2 cks., £7.; Madras, 9 kgs., £19.

LEAD NITRATE—
Calcutta, 1 ck., £31.

LITHIUM IODIDE—
Shanghai, 1 cs. (pt.), £6.

MAGNESIA—
Brisbane, 2 cs., £9.
Otago, 6 cs., £14.
Sydney, 35 cs., £84.
Wellington, 30 cs., £72.

MAGNESIA (CALCINED)—
Panama, 2 cs., £9.
Rio de Janeiro, 3 cs., £39.

MAGNESIUM CARBONATE—
Bombay, 10 cs., £17.; Dunedin, 2 cs., £7.; Melbourne, 1 cks., £7.; Rio de Janeiro, 2 cs., £9.

MAGNESIUM SULPHATE—
Barbados, 18 c., £29.; Bluff, 16 c., £19.; Bombay, 1 t. 11 c., £43.; Brisbane, 7 t. 10 c., £168.; Cape Town, 6 c., £8.; Colom, 5 c., £6.; Cristobal, 1 t. 5 c., £35.; Dunedin, 3 t. 16 c., £95.; East London, 18 c., £25.; Hobart, 1 t., £25.; Launceston, 1 t. 5 c., £28.; Maryborough, 5 c., £6.; Melbourne, 11 t., £251.; Mombasa, 10 c., £12.; Pt. Elizabeth, 8 c., £13.; Sydney, 4 t. 18 c., £110.; Victoria, B.C., 3 c., £5.; Wellington, 5 c., £10.

MANGANESE DIOXIDE—
Auckland, 4 cks., £14.

MERCURIALS (*otherwise undes.*)—
Amoy, 1 cs. (pt.), £6.; Calcutta, 1 cs., £23.; Melbourne, 2 cs. (pt.), £18.

MERCURY BICHLORIDE—
Penang, 1 cs., £17.

MERCURY SUBCHLORIDE—
Adelaide, 1 cs. (pt.), £13.

METHYL ACETONE—
Paris (F.), 3 drms., £70.

METHYL SALICYLATE—
Alexandria, 2 cs. (pt.), £12.
Bangkok, 16 cs. (pt.), £83.

NITRIC ACID—
Colombo, 7 c., £29.; Madras, 9 c., £50.; Padang, 5 c., £24.

PALLADIUM CHLORIDE—
Fredrikstad, 1 cs., £120.

PHOSPHORIC ACID—
Lyttleton, 2 cs., £30.; Melbourne, 4 cs., £11.; Pt. Elizabeth, 1 cs., £6.; Quebec, 1 cs., £5.; Saigon, 2 cs., £6.

PHOSPHORUS—
Sydney, 8 cs., £69.

POTASH (*otherwise undescribed*)—
Sydney, 2 cs., £23.

POTASSIUM ACETATE—
Calcutta, 1 cs., £5.

POTASSIUM BICARBONATE—
Colombo, 7 cs., £29.; Calcutta, 1 cs., £6.; Cape Town (F.), 2 kgs., £5.; Melbourne, 2 cks., £15.; Rangoon, 2 cs., £6.

POTASSIUM BINOXALATE—
Adelaide, 1 kg., £7.

POTASSIUM BROMIDE—
Auckland (F.), 2 cs., £6.; Adelaide, 20 cs., £75.; Calcutta, 1 cs., £8.; Colombo, 6 cs., £33.; Melbourne, 1 ck., £9.

POTASSIUM CARBONATE—
Beira, 6 kgs., £17.; Durban (F.), 4 kgs., £9.; Melbourne, 1 ck., £6.; Melbourne (F.), 1 cs., £5.; Shanghai, 2 pkgs., £7.

POTASSIUM CHLORATE—
Beira, 18 kgs., £56.
Calcutta, 3 c., £6.

POTASSIUM CITRATE—
Bombay, 4 cs., £50.; Calcutta, 5 cs., 4 cs. (pt.), £107.; Colombo, 2 cs., £18.; Melbourne, 2 cs. (pt.), £14.

POTASSIUM CYANIDE—
Beira, 5 cs., £42.; Canterbury, 2 cs., £17.; Shanghai, 4 cs., £47.; Singapore, 1 cs., £7.; Swatow, 2 cs., £33.

POTASSIUM IODIDE—
Accra, 1 cs., £21.; Addah, 3 cs., £50.; Adelaide, 1 cs., £88.; Antwerp, 1 cs., £86.; Bangkok, 3 cs., £260.; Calcutta, 2 cs. 4 cs. (pt.), £483.; Dixcove, 1 cs., £17.; Hong Kong, 1 cs. (pt.), £45.; Genoa, 2 cs., £173.; Lyttleton, 1 cs., £88.; Melbourne, 2 pkgs., 2 cs. (pt.), £235.; Perth, 1 cs., £88.; Pt. Elizabeth, 1 cs., £20.; Quittah, 1 cs., £8.; Rotterdam, 2 cs., £190.; Rio de Janeiro, 4 cs., £363.; Sekondi, 1 cs., £10.; Shanghai, 2 cs., £175.; Wellington, 1 cs., £88.; Zanzibar, 1 cs. (pt.), £7.

POTASSIUM METABISULPHITE—
Sydney, 1 kg., £5.

POTASSIUM PERMANGANATE—
Buenos Aires, 1 cs. (pt.), £5.
Melbourne (F.), 1 kg., £5.

POTASSIUM PRUSSIATE—
Otago, 1 kg., £7.
Reval, 49 cks., £1,306.

POTASSIUM SULPHATE—
Las Palmas, 1 t., £12.

PRUSSIAN BLUE—
Christiania, 2 cks., £104.

PYROGALLIC ACID—
Paris, 2 cs., £70.
Quebec, 1 cs., £5.

ROCHELLE SALTS—
Vera Cruz, 3 c., £12.

SALAMMONIAC—
Dunedin, 2 kgs., £6.
Wellington, 2 kgs., £6.

SALICYLIC ACID—
Adelaide, 2 cs., £28.; Cape Town, 1 cs., £12.; Jamaica, 1 cs. (pt.), £6.; Melbourne, 4 cs., £46.; Pt. Swettenham, 1 cs., £13.

SALTPETRE—
Adelaide, 4 t., £463.; Auckland, 10 c., £20.; Bluff, 4 c., £9.; Cape Town, 6 c. (F.), £10.; Cape Town, 5 c., £11.; Colombo, 10 c., £20.; Dunedin, 2 t. 10 c., £99.; Durban, 2 t. 5 c., £93.; Limon, 2 c., £5.; Rio de Janeiro, 5 c., £10.; Timaru, 5 c., £10.; Wellington, 10 c., £20.

SHEEP DIP—
Baltimore, 9 t. 10 c., £202.
Hobart, 1 t. 4 c., £53.

SILVER NITRATE—
Alexandria, 1 cs., £83.; Bombay, 1 cs. (pt.), £98.; Cape Town, 1 cs., £48.; Copenhagen, 1 cs., £163.

SODA ASH—
Pt. Said, 1 t., £19.

SODA CRYSTALS—
Bangkok, 1 t., £10.; Cape Town, 5 t., £29.; Demerara, 15 c., £8.; Melbourne, 1 t., £23.

SODIUM BICARBONATE—
Barbados, 10 c., £7.; Calcutta, 1 t. 5 c., £70.; Cape Town, 6 c., £9.; Cristobal, 1 t. 5 c., £40.; Durban, 1 t. 10 c., £40.; East London, 18 c., £28.; Monte Video, 9 c., £33.; Pt. Elizabeth, 1 t. 3 c., £29.

SODIUM BISULPHITE—
Belawan, 7 t., £133.; Colombo, 2 t., £38.; Malacca, 2 t. 10 c., £49.; Penang, 1 t. 10 c., £29.; Pt. Swettenham, 1 t. 13 c., £32.; Singapore, 1 t., £20.

SODIUM BROMIDE—
Adelaide, 1 cs., £5.
Melbourne, 2 c., £7.

SODIUM CARBONATE—
Auckland, 4 c., £9.; Cape Town, 5 c., £8.; Durban, 5 c., £8.; Shanghai, 1 t. 2 c., £19.; Singapore, 7 c., £27.; Yokohama, 1 t., £19.

SODIUM CITRATE—
Bangkok, 2 c., £15.; Calcutta, 2 cs., 4 cs. (pt.), £25.; Montreal, 2 t. 5 c., £441.

SODIUM HYDROSULPHITE—
Bombay, 4 t. 19 c., £629.

SODIUM HYPOPHOSPHITE—
Melbourne, 1 cs., £9.
Sydney, 1 c., £16.

SODIUM HYPOSULPHITE—
Cape Town, 10 c., £8.; Demerara, 5 c., £7.; Durban, 10 c., £8.; Delagoa Bay, 2 c., £13.; Inhambane, 2 c., £8.; Lagos, 1 c., £7.; Singapore, 2 t. 3 c., £67.

SODIUM IODIDE—
Melbourne, 1 cs. (pt.), £13.

SODIUM PEROXIDE—
Durban, 1 t. 7 c., £185.

SODIUM PYROPHOSPHATE—
Melbourne, 1 kg., £6.

SODIUM SALICYLATE—
Colombo, 16 c., £75.
Melbourne, 1 c., £15.
Shanghai, 2 c., £28.

SODIUM SALTS (*otherwise undes.*)
Perth, 5 c., £6.

SODIUM SILICATE—
East London, 7 c., £11.

SODIUM SULPHATE—
Amoy, 1 c., £11.
Barbados, 1 t., £6.
Otago, 10 c., £68.

SODIUM SULPHIDE—
Auckland, 10 t., £170.
Melbourne, 5 t. 10 c., £78.
Sydney, 10 t., £130.

SODIUM SULPHITE—
Auckland, 1 t. 3 c., £29.; Cape Town, 5 c., £9.; Durban, 5 c. £9.; Penang, 1 t. 5 c., £32.; Shanghai, 8 c., £9.; Singapore, 4 c., £22.

SODIUM TARTRATE—
Melbourne, 5 c., £21.

SPENT OXIDE—
Antwerp, 212 t., £429.

SULPHUR—
Cape Town, 4 t. 9 c., £64.; East London, 2 t., £18.; East London, (F.), 10 c., £5.; Melbourne, 10 c., £7.; Montreal, 2 c., £6.; Yokohama, 1 t., £15.

SULPHURIC ACID—
Antofagasta, 2 t. 3 c., £70.; Accra, 5 c., £13.; Aden, 15 c., £23.; Antwerp, 13 c., £60.; Bangkok, 2 c., £7.; Cape Town, 1 cs., £8.; Calcutta, 3 c., £12.; Colombo, 2 t. 10 c., £91.; Madras, 10 c., £44.; Sekondi, 1 t. 11 c., £38.; Singapore, 6 c., £13.

TANNIC ACID—
Calcutta, 1 cs., 1 cs. (pt.), £13.
Wellington (F.), 1 cs. (pt.), £5.

TARTARIC ACID—
Beira, 1 c., £7.; Bombay, 15 c. (F.), £110.; Cape Town, 2 c., £13.; Channel Isles, 1 c., £7.; East London, 3 c., £27.; Jamaica, 3 c., £24.; Lyttleton, 10 c., £61.; Madras, 2 c. (F.), £13.; Montreal, 17 c., £133.; Pt. Elizabeth, 2 c. (F.), £14.; Pt. Sudan, 2 c., £14.; Singapore, 10 c. (F.), £60.; Toronto, 3 c., £32.; Vera Cruz, 2 c., £13.; Wellington, 3 c., £19.

TIN CRYSTALS—
Bombay, 5 cs., £39.

TIN OXIDE—
Brussels, 5 cks., £225.

TURPENTINE—
Singapore, 2 drms., £6.

ZINC OXIDE—
Batoum, 7 cks., £158.; Bombay, 4 cks., £40.; Brussels, 1 ck., £6.; Canton, 1 kg., £6.; Fremantle, 2 kgs., £5.; Genoa, 16 bgs., £46.; Limon, 2 kgs., £5.; Melbourne, 2 cs., £11.; Shanghai, 1 ck., £7.; Santander, 16 bgs., £50.; Shanghai, 2 kgs., £7.; Wellington, 22 bgs., £51.

ZINC SULPHATE—
Rangoon, 3 cs., £5.

ZINC SULPHIDE—
New York, 2 cks., £108.

Week ending September 22.

ANTIMONY REGULUS—
Melbourne, 10 t.

BEESWAX—
Iddo, 1 c.
Sydney, 1 t. 3 c.

CERESINE WAX—
Sydney, 10 c.

FULLER'S EARTH—
Bombay, 8 c.; New York, 55 t.; Rio de Janeiro, 20 t.; San Francisco, 30 t.

GLUE, SIZE, AND GELATINE—
Adelaide, 1 t. 3 c.; Arica, 1 c.; Auckland, 3 c.; Beira, 1 c.; Bombay, 5 t. 1 c.; Boston, 4 t. 16 c.; Brisbane, 1 c.; Calcutta, 13 t. 1 c.; Cape Town, 1 t.; Dunedin, 1 c.; Durban, 1 c.; Hong Kong, 4 t. 5 c.; Lagos, 1 c.; Madras, 5 c.; Melbourne, 1 t. 10 c.; Montreal, 1 t. 14 c.; Newchang, 2 t.; New York, 2 c.; Perth, 5 c.; Pt. Elizabeth, 11 c.; Pt. Swettenham, 10 c.; Rangoon, 1 c.; St. Johns, 10 t.; Shanghai, 5 t. 9 c.; Sydney, 4 t. 6 c.; Tientsin, 4 c.; Toronto, 2 t.; Townsville, 3 c.; Wellington, 1 c.; Yokohama, 1 c.

ISINGLASS—
Osaka, 3 c.

LEAD (RESIDUE)—
Antwerp, 78 t.

MINERAL WAX—
Sydney, 1 t.

NAPHTHA (WOOD)—
Durban, 224 g.

PARAFFIN WAX—
Delagoa Bay, 31 t. 10 c.

PLUMBAGO—
Durban, 10 c.; Sourabaya, 1 t.

QUININE—
Bombay, 5,440 oz.; Calcutta, 12,317 oz.; Hong Kong, 5,145 oz.; Melbourne, 100 oz.; Monrovia, 352 oz.; Perth, 600 oz.; Sydney, 5,000 oz.

ROSIN—
Callao, 2 c.; Iquique, 7 t. 10 c.; Santander, 10 c.; Valparaiso, 11 t. 4 c.

SALT—
Aden, 8 c.; Bangkok, 4 c.; Delagoa Bay, 17 c.; Durban, 4 t. 11 c.; East London, 8 c.; Hobart, 16 c.; Kobe, 4 c.; Malta, 1 c.; Matadi, 4 c.; Pt. Elizabeth, 6 c.; Pt. Said, 6 c.; Pt. Sudan, 16 c.; Rangoon, 9 c.; St. Kitts, 13 c.; Sydney, 1 c.

SHELLAC—
Italy, 6 c.

SOAP—
Addah, 5 t. 19 c.; Adelaide, 3 c.; Aden, 5 c.; Ahwaz, 2 t.; Antwerp, 1 c.; Auckland, 6 c.; Bangkok, 16 c.; Barbados, 4 t. 9 c.; Beira, 2 c.; Bombay, 14 c.; Boston, 5 t. 12 c.; Bourgas, 3 c.; Buenos Ayres, 9 t. 1 c.; Calcutta, 6 c.; Christchurch, 1 t. 5 c.; Colombo, 18 c.; Cuba, 5 t. 7 c.; Duala, 2 t. 13 c.; Dunedin, 17 c.; Durban, 8 c.; East London, 1 c.; Genoa, 12 c.; Gibraltar, 1 c.; Hong Kong, 8 c.; Iddo, 1 c.; Italy, 4 c.; Kilindini, 6 c.; Kobe, 2 c.; Lagos, 4 t.; Limon, 3 c.; Madras, 1 t. 16 c.; Malta, 18 c.; Manila, 1 c.; Melbourne, 10 c.; Mombasa, 2 c.; Monrovia, 18 c.; Montreal, 1 t. 5 c.; Napier, 3 c.; New York, 1 c.; Penang, 6 c.; Perth, 6 c.; Pt. STEARINE—
Adelaide, 10 c.

TALLOW—
Danzig, 35 t. 2 c.; Harlingen 2 t. 15 c.; Nantes, 10 t. 3 c.; Oporto, 5 t. 4 c.; Singapore, 4 c.; Winnebah, 3 c.

TAR (STOCKHOLM)—
Durban, 13 c.
Hong Kong, 1 t. 8 c.
Mauritius, £27.
Valparaiso, 1 t. 6 c.

WAX (*otherwise undescribed*)—
Madras, 5 t.; Osaka, £51.

WHITE LEAD—
Accra, £27.; Auckland, £1,014.; Azores, £9.; Basra, £39.; Brisbane, £73.; Cape Town, £98.; Channel Islands, £120.; Christchurch, £356.; Durban, £9.; East London, £34.; Gisborne, £46.; Hong Kong, £52.; Jamaica, £39.; Lyttleton, £164.; Melbourne, £1184.; Perth, £104.; Pt. Elizabeth, £72.; Rangoon, £10.; Rotterdam, £44.; Sydney, £1,013; Timaru, £332.; Townsville, £4.; Trinidad, £43.; Wellington, £449.

ZINC ASHES—
Antwerp, 30 t.

MANCHESTER.

Week ending September 18.

AMMONIUM CARBONATE—
Antwerp, 10 cks.
Gothenburg, 15 cks.

CHEMICALS (*otherwise undescribed*)
France, 135 kgs.

COAL TAR PRODUCTS—
Creosote Oil
Galveston, 1,072,996 galls.
Unspecified
Czecho-Slovakia, 1 cs.
Holland, 5 cks.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Melbourne, 20 drms.
Sydney, 10 drms.

FERRO MANGANESE—
Baltimore, 144 t.

SALT—
Montreal, 2,400 bgs.

SOAP—
Bushire, 6 cs.
Mohammerah, 70 bxs.

SODIUM BICARBONATE—
Basra, 10 bgs., 40 kgs.

NEWCASTLE-ON-TYNE

Week ending September 22.

AMMONIA—
Copenhagen, 5 brls., 71 cks.

ANTIMONY—
Genoa, 1 cs.

CARBON (RETORT)—
Leghorn, qnty. in bulk.

CAUSTIC SODA—
Bergen, 86 drms.
Copenhagen, 68 drms.
Gothenburg, 40 drms.

COPPER OXIDE—
Rotterdam, 1 ck.

COPPER PRECIPITATE—
Bergen, 4 cks.

LITHARGE—
Genoa, 3 cks.; Gothenburg, 80 pkgs.; Rotterdam, 29 cks.

RED LEAD—
Bergen, 10 kgs., 14 cks.
Copenhagen, 34 cks.
Gothenburg, 62 cks.
Rotterdam, 200 cks.

SOAP—
Bergen, 1 bx.
Gothenburg, 1 cs.

SODIUM SULPHATE—
Batavia, 20 cs.

SODIUM SULPHITE—
Gothenburg, 20 bgs., £124.

WHITE LEAD—
Copenhagen, 51 cks.
Gothenburg, 28 cks.
Rotterdam, 7 cks.

ZINC OXIDE—
Gothenburg, 5 drms.

N. & S. SHIELDS.

Week ending September 22.

NIL.

PRICES CURRENT.

WEDNESDAY, SEPT. 26, 1923.

PREPARED BY MESSRS. HIGGINBOTTOM & CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, but it must be understood that the prices in different localities may vary.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

The price of single copies is 6d. each, postage extra.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

THOUGHTS ON THE IMPERIAL CONFERENCE.

THE many thousands of people from this country who have visited France during the last few months either on business or on pleasure, cannot fail to have been impressed by one very significant fact, the complete absence of unemployment. Neither in the towns nor in the country districts can the spectacle of able-bodied workmen wasting their time in idleness be observed. Far from there being a surplus of labour indeed, there is actually a shortage, and additional labour has quite recently been imported into France from Portugal. In our own country, on the other hand, there are at present over one and a quarter million persons unemployed, and every indication that this number will expand very greatly during the coming winter. France is a debtor nation. Both her internal and external debts are enormous, and her prospects of obtaining relief by the extraction of any immediate large sum from Germany are by no means bright. Her franc, which prior to the war was worth tenpence, is now valued at rather less than threepence. Great Britain on her part is a creditor nation to all countries except the United States of America, and her pound sterling has but little depreciated in the international money market. Yet Great Britain is confronted with an industrial slump of a magnitude such as has never before been experienced, whereas France can maintain the whole of her population if not in affluence, yet in comparative comfort and freedom from all dread of destitution. In view of these facts, is it not logical to ask ourselves whether the fiscal policy of this country is fundamentally wrong from the standpoint of present-day needs, and whether our adherence to the shibboleths of Free Trade and the high international status of the pound sterling has worked us untold harm and contributed in no mean degree to the grave position in which we find ourselves to-day? For our own part we have no hesitation in returning an unconditional affirmative to both the above questions. France is prosperous because she has been compelled to become self-sustaining to the utmost of her capacity. Her markets are not flooded with cheap foreign manufactured goods and raw materials. The French manufacturer, unlike his British *confrère*, is not faced with the ever-present danger of being compelled to sell his goods

below cost under the pressure of foreign competition. In common with most countries of the world, France has adopted the policy of fostering first and foremost the welfare of her own inhabitants and workpeople by cutting down her imports of manufactured goods to a minimum and by erecting a tariff wall sufficiently high to ensure that foreign goods when they do enter into competition with the home products shall do so under equitable conditions. The depreciation of the franc has not inconvenienced France to any great extent, whilst on the other hand there is every reason for thinking that had she made a genuine attempt to maintain the franc at a figure approaching the pre-war parity, her economic position would have been far worse than it actually is. So far as manufactured goods are concerned, a great diminution or even a temporary total cessation of imports into the United Kingdom would result in an immediate revival of manufacturing activities and the reduction of unemployment to very small proportions. It is quite true, and we are not losing sight of the fact that the major portion of our foodstuffs and many of our raw materials must be imported. The opponents of the policy of Protection make the most of these facts, and we grant that were the United Kingdom alone to be considered, the ideal of a self-sustaining nation would be impracticable, although we are convinced that even the production of foodstuffs in this country could be at least doubled, if our agriculturists were afforded their much-needed protection. By extending our mental outlook from the United Kingdom to the British Empire as a whole, however, we find that this difficulty vanishes completely. There is no essential foodstuff and raw material that is not contained in some part of the British Empire in sufficient quantity to supply the whole of the Empire. The Empire can be made and should be made absolutely self-sustaining and independent. A general Imperial tariff or a United Kingdom tariff with ample preferential treatment of our Empire co-partners is no visionary's dream, but a piece of practical politics rendered essential by the needs of the time.

THE CHEMIST AS ADMINISTRATOR.

A striking refutation of the frequently expressed opinion that the mental capacity and outlook necessary to the successful business man on the one hand and to the successful chemist on the other, are mutually incompatible, is afforded by the career of Dr. Carl Duisberg, who is at present the greatest figure in the German chemical manufacturing industry. Just over forty years ago, at the age of twenty-two, Dr. Duisberg entered the services of the Bayer colour factory at Elberfeld in the capacity of a research chemist. His work both as an investigator himself and as the director of research in others proved so fruitful that the activities of his employers expanded by leaps and bounds. So rapidly did they expand indeed, that the Elberfeld site proved too cramped, and additional factory buildings were erected at Leverkusen. Dr. Duisberg's latent gifts for organisation and administration were recognised by his directors, and in 1895 he was given the opportunity of leaving his purely chemical work and devoting himself entirely to the organisation of the new Leverkusen factory. This opportunity Dr. Duisberg accepted, and such a success did he prove in his new capacity that in 1900 he was elected a director himself with full powers. To-day he is not only the managing director of the great Bayer works, but is president of the powerful "Verein zur Wahrung der Interessen der Chemischen Industrie Deutschlands." It was Dr. Duisberg's foresight that saw the necessity for co-operation between the German dyestuff manufacturing firms, and his driving power that brought into existence in 1916 that formidable combination, the Interessengemeinschaft. Dr. Duisberg's is not an isolated case, though an exceptionally distinguished one. All the large German chemical works contain in their directorates men who have worked their way up the ladder rung by rung and are familiar with all the details of the businesses they now control. Such careers as that of Dr. Duisberg afford a lesson that the present directorate of our largest British dyestuffs manufacturing concern cannot afford to disregard.

BLEACHING LIQUORS FROM LIQUID CHLORINE.

Sir Max Muspratt, addressing a meeting of the Society of Dyers and Colourists at Bradford last week, expressed the opinion that many large consumers of bleaching powder might be well advised on the grounds of economy to buy liquid chlorine and to make their own bleaching liquors on the spot. This idea has been gaining in favour for several years now, and we believe has already been given effect to in some quarters. In this connection also it is interesting to note that considerable progress has been made in the United States. The Mathieson Alkali Works (Inc.) of Niagara Falls especially have been energetic in this direction, and have elaborated a system of their own for preparing bleach liquors for the pulp and paper industries. Several plants have been installed and are working very satisfactorily, and at a recent meeting of the Technical Section of the American Pulp and Paper Association, held in connection with the National Exposition of Chemical Industries, Mr. J. H. MacMahon, of the Mathieson firm, gave a full explanation of such plants. In a future issue we shall give a detailed account of the Mathieson system, but it will suffice here to state that the essential principle consists in vapourising the liquid chlorine in a leaden coil which is immersed in the liquor in the tank where the bleaching solution is prepared. The tank itself is of concrete, and the operation is so regulated that the latent heat of vapourisation of the chlorine counteracts the heat of the reaction between the chlorine and the lime, and thus keeps the temperature of the liquor below the point at which the hypochlorite decomposes. The system is very ingenious, and the claims are made that the loss of chlorine does not exceed one per cent. and that the control is almost automatic.

WOOD PRESERVATIVES.

MODERN TECHNOLOGICAL PROGRESS.

By "Investigator."

THE art of wood preservation has been practised from very early times. The ancient Egyptians, for example, applied antiseptic oils to the woodwork of their mummy-coffins. In comparatively recent times, the availability of coal tar products led to the introduction of the creosoting process. Zinc chloride was introduced as a wood preservative in 1838 by Burnett. In 1906, Wolman patented the use of fluorides in conjunction with heavy metal salts, while during the last twenty years, hundreds of patents have been granted covering methods of wood preservation.

Wood preservatives now play an increasingly important part in the mechanical wood pulp industry, in connection with the stacking of the wood and the storage of the pulp. At the present time, the whole problem of the protection of marine timber structures, particularly in tropical waters, is being studied under the ægis of a special committee of the Institute of Civil Engineers.

The Destructive Organisms and Their Effects.

Four destructive types of organism have to be countered—namely, bacteria, fungoid growths, insect pests, such as the termite beetle, and marine organisms, such as *Teredo navalis*. The latter is particularly destructive, frequently boring into marine timbers to a depth of an inch or more. Among the more common wood-destroying fungi, may be mentioned *Lenzites trabia, Fomes roseus, Lentinus lepideus, Lenzites saepiaria, Merulius lacrymans*, and *Coniphora cerebella*. Of these, the latter three are the organisms causing dry rot. The activity of the bacteria and moulds is accompanied by the production of many cellulose-destroying enzymes. In the presence of air and nutrient salts, the cellulose is attacked with the formation, first, of hexose and then of carbon dioxide. Humus-like substances also make their appearance.

Very serious damage is done to stacks of unseasoned timber. Thus in a case of spruce reported, 75 per cent. of the wood substance was lost, the cellulose content falling from 58 to 13 per cent. in twelve months, while the content of matter soluble in hot water more than doubled. The yields of methyl alcohol, acetic acid, and pentosans also depreciated markedly, falling to the extent of 75, 80, and 70 per cent. respectively. Owing to the formation of readily-reducible substances, the copper number rose.

Preservatives exercise a two-fold function—they cut off air and moisture from the organisms by hermetically sealing the pores, and they poison the food supply or render it non-assimilable.

Wood preservatives can be divided into three classes, insoluble oils, water-soluble salts and insoluble precipitates formed in the fibres. Creosote and, to a minor extent, mineral oil are the only commercially-important members of the first group. Among the soluble salts, the most widely used are copper sulphate, zinc chloride, mercuric chloride and sodium fluoride, while copper and zinc resinates are examples of precipitated preservatives.

The Creosoting of Timber.

Before creosoting, the timber is usually dried by stacking or by keeping at 70° C. for 24 hours. Two methods of injection are in vogue, the "full cell" or Bethell process and the "empty cell" process due to Rueping and Lowry. In the former procedure, railway sleepers are run on iron frames into long steel boilers, the pressure is reduced to 1/8 atmosphere, and then creosote at about 70° C. is pumped in under a pressure of 160lb., the treatment lasting several hours. Sometimes the wood is steamed in the boiler before evacuation. There is a definite relation between the viscosity and hence the temperature of the creosote and the penetration. Other factors are the pressure, the time of treatment and the structure of the wood. Thus, soft woods will absorb about a gallon per cubic foot, hard woods somewhat less. As a rule the creosote is injected to a depth of from one to four inches, the more vulnerable sap-wood being readily penetrated.

In the "empty cell" treatment, the aim is to saturate only the cell walls and not the cavities. Instead of starting with a partial vacuum, the creosote at 200lb. is forced in against an initial pressure of 50lb. per square inch, until sufficient oil has been taken up. When the external pressure becomes normal, the compressed air inside the cells expels most of the creosote from the cell cavities, but leaves that which has soaked into the walls. In a modified process, the expulsion of the excess preservative is assisted by means of reduced pressure.

A special committee of the American Wood Preservers' Association (Report, 1915), recommends the "full-cell" process for impregnating piling and other marine structures, and for permanent timber-work where there is not much mechanical wear. The creosote concentration should vary between 20 and 10lb. per cubic foot, according as to whether or not the timber is to be protected from marine boring organisms. For railway sleepers and other structures subject to weathering and to superficial mechanical wear, impregnation with 5lb. per cubic foot by "empty-cell" processes is advised.

Creosote suitable for wood preservation should have a boiling-point range of 210-355° C. and a specific gravity of 1.09 at 20° C. For the sake of cleanliness, freedom from carbon particles is desirable. Low-boiling constituents, although very toxic, should be absent, as they are soon lost by volatilisation. Thirty per cent. of refined coal tar may be added to good quality creosote, without impairing its efficiency.

Special Methods of Impregnation.

In some processes the wood is treated with the vapour of the oil, or it is subjected under pressure to a spray of the oil, atomised with air or steam (*Ger. Pat.*, 347,632, of 1915). The wood may then be submerged in the liquid and hydraulic pressure applied. In order to impregnate the wood with paraffin, it is first immersed in boiling water to expel the air from the cells, then in a bath of molten paraffin at above 100° C. until no more steam bubbles are formed, after which it is allowed to cool *in situ*. In a closely similar method, the wood is immersed directly in a creosote bath at above 100° but below the fire point of the oil, until all moisture is expelled as steam (*U.S. Pat.*, 1,382,103, of 1921).

In the treatment of "green" or unseasoned timber, the creosote should be rendered miscible with water before application. For this purpose the creosote may be sulphonated or caustic soda may be added followed by "fixing" in the fibre with ferrous sulphate. Borates and phosphates are claimed to increase the miscibility of the higher phenols. With the same end in view, and in order to assist the absorption, the creosote may be emulsified. Thus creosote, rosin, and xylenol emulsions, stabilised with soap or sodium resinate, form the subjects of recent specifications. The preparation "Preservol" consists of creosote partially emulsified with pyroligneous acid.

Surface charring of creosoted and untreated timber is frequently used, the preservative action being due to the tarry products which result from charring. Another mode of operation is to heat the wood in coal-tar pitch to the charring temperature until all moisture is expelled. The surface may then be coated with a harder pitch.

The Use of Metallic Salts.

Creosoted timber is heavy, highly inflammable and has a pronounced odour. To overcome these disadvantages, the use of inorganic preservatives in smaller concentrations has been introduced. Many of these—*e.g.*, mercuric chloride and copper sulphate, are readily soluble and highly poisonous, drawbacks of particular importance in wet and cattle-frequented localities. However, owing to their colloidal condition in the wood, diffusion is not very marked, and consequently, the amount dissolved out is not so great as might be expected. Insoluble metallic compounds can be applied by first impregnating the wood with a soluble salt and then treating it with a precipitating bath. Thus, insoluble fluorides or resinates may be formed in the fibre; or the wood may be impregnated with a solution of basic copper carbonate in ammonium or sodium carbonate, and the copper compound precipitated by dilution or by volatilisation of the ammonium carbonate (*U.S. Pat.*, 1,388,513, of 1921). An interesting procedure is to treat the wood with a benzene solution of antimony trichloride. On hydrolysis, an insoluble basic compound results, which reduces the inflammability and renders the wood immune from fungoid growth (*U.S. Pat.*, 1,418,610, of 1922).

Zinc and Copper Compounds.

Wood is penetrated readily by aqueous salt solutions. Impregnation can usually be effected by soaking in open baths or by brushing. In order to save time, however, the solutions may be injected under pressure. The principle of electro-osmosis has also been applied to facilitate penetration.

Among zinc compounds may be mentioned zinc chloride, zinc sulphate, and the double zinc ammonium chloride and sulphate, the alkaline solution of the latter, as well as the corresponding compounds of copper and magnesium, being used to impart fire-resisting properties to the wood (*Brit. Pat.*, 151,661, of 1919). Zinc chloride, being deliquescent, is suitable only for dry situations, an effective concentration being ½ to ¾lb. of the dry salt per cubic foot. In applying the double chlorides and sulphates, the sap is first removed by reducing the pressure and the solutions injected under 170lb. Comparative toxicity experiments with the highly-destructive fungus *Fomes annosus* showed that zinc chloride, zinc sulphate and the mixture of the former with aluminium sulphate were about equally effective. Emulsions of zinc chloride with creosote alone or with copper powder in addition ("Holzhelfer") are also used, the latter being slightly less effective than zinc chloride alone (Fleming and Humphrey, *J. Ind. Eng. Chem.*, 1915).

Copper sulphate mixed with ferrous sulphate is sometimes used. Copper hydroxide dissolved in wood tar—that is substantially copper phenolates—has been suggested (*Brit. Pat.*, 7,275, of 1915). According to Falck (*Chem. Zeit.*, 1919, 43), copper hydroxide alone, although much used as a plant spray, is not an effective wood preservative. An ammoniacal solution of copper and zinc phenolates, containing 8 per cent. of metals and 8 per cent. of phenol, is claimed to be an effective protection against wood-destroying organisms. Applied to mine timbers, such a solution ("Viczsal") was fairly efficient, but during seven years' exposure did not confer complete immunity from rottenness (Nowotny, *Z. angew. Chem.*, 1922).

Arsenic and Chromium Compounds.

A process largely used in Australia to protect Kauri timber, in contact with earth, from the ravages of the termite beetle (white ant) is that of Powell (*Brit. Pat.*, 9,044, of 1915). The preservative medium consists of sugar solution (108°) to which is added dextrin (5 per cent.), gum tragacanth (½ per cent.), and an arsenic compound (3 per cent. arsenic). To impregnate the timber it is immersed in the boiling liquid and then dried. Sodium arsenite, combined with the colloidal matter in sulphite-pulp liquor, forms another preservative. Creosote is not wholly effective in its action against *Teredo* and other marine organisms. From experiments carried out by the Marine Biological Laboratories at Plymouth, certain organic compounds of arsenic, used in gas warfare, when applied in alcoholic solution, should give promising results. Experiments are now in progress at Lowestoft and Colombo, with timber impregnated with these compounds dissolved in commercial creosote.

Chromates and bichromates enter into the composition of many preservatives. A very recent proposal is that of Chavastelon (*Comptes. Rend.*, 1923, Vol. 176), according to which wood can be efficiently protected by painting or impregnating it with copper bichromate, made by mixing a cold 6 per cent. solution of copper sulphate with a slight excess of a solution of sodium or potassium bichromate of similar strength. On exposure, the copper compound gradually dissociates into basic chromates and chromic acid, the latter exercising a continuous fungicidal action.

According to a recent patent, a mixture of three substances having high osmotic pressure (easily diffusible), high antiseptic power and permanency, respectively, is injected into the wood. For instance, a paste consisting of saturated calcium-chloride solution (80 parts), potassium chromate (15) and copper powder (5 parts) together with a filling material, is used (*Brit. Pat.*, 159,479, of 1921).

Mercuric Chloride as a Wood Preservative.

Treatment with corrosive sublimate ("kyanising") is used mainly as a protection against insect pests such as termites, wood being treated with a 0.7 per cent. solution for this purpose. Absorption is rapid at first, but the maximum is only attained after some days. For equal absorption, fir and pine require immersion for 10 and 7 days respectively. Telegraph poles made of these woods will have a life of about 14 years after treatment. Impregnation may be effected by capillary action, only the portion to be embedded in the ground being treated with mercuric chloride, the rest of the pole being impregnated with fluorides, copper sulphate or zinc chloride. Another method is to bore holes at suitable intervals in the wood, into which is plugged a mixture of common salt (16 parts), arsenious oxide (6 parts) and mercuric chloride (1 part). On standing the wood becomes impregnated by diffusion (*U.S. Pat.*, 1,276,725, of 1918). In order to open the pores and so facilitate the absorption, hydrochloric acid may be added to the mercury salt. A mixture of arsenious oxide and mercuric chloride dissolved in strong hydrochloric acid has been proposed, beechwood tar being incorporated to prevent precipitation on dilution. Mercuric silicate has also been used.

The Use of Fluorine Compounds.

Sodium fluoride is a constituent of a large number of wood-preserving compositions. Owing to its solubility, it is not of much use for exposed timber such as sleepers. Even at a dilution of one per cent. it is effective against such fungi as *Penicilium glaucum* and *Helicomycelium fulginosum*, but dilute solutions have very little effect on the spores of both saprophitic and parasitic fungi. Sapstain, a discolouration, due to organic growths, very prevalent in lumber, can be prevented by treating with sodium fluoride, which is frequently used in conjunction with arsenious oxide and mercuric chloride for protecting mine timbers. In the latter case, the fluoride prevents the coagulation of the albumen and so increases the antiseptic power, probably by forming a double compound with the mercuric salt. A suitable impregnating solution would consist of 6.5 parts of a 0.6 per cent. solution of mercury salt and 9 parts of a similar solution of fluoride (*Brit. Pat.*, 148,137, of 1920).

Many phenols and nitro compounds have been used together with the fluoride. Very effective preservatives consist of sodium fluoride 85-95 parts, and 15-5 parts of 2.4-dinitro-phenol or dinitro-*o*-cresol. In the case of phenol-fluoride compositions, a chromium salt is added in order to fix the phenol on the wood. "Basilite," a mixture of sodium fluoride (89 per cent.) and the compound of aniline and dinitrophenol (11 per cent.) is a very effective preservative for mine timberwork. Trioxymethylene has also been used in admixture with soluble fluorides (*U.S. Pat.*, 1,274,171, of 1918).

According to an Austrian Government report, the sparingly soluble zinc fluoride has been used with good results for telegraph poles, for which purpose it compares very favourably with copper sulphate. Lead, sodium, and mercury silicofluorides have also been suggested as being less soluble and more toxic than the corresponding fluorides. For mine timber preservation, solutions of zinc and other fluor-sulphonates have been patented (The Chemical Foundation, Inc., *U.S. Pat.*, 1,448,276, of 1923). Fluorsulphonic acid alone or dissolved in creosote, as well as the salts of the acid with organic bases are also proposed for the same purpose (*Ger. Pat.*, 299,761, of 1916).

Modern Organic Wood Preservatives.

Besides creosote and the phenolic substances already mentioned, compounds of the higher phenols with such organic bases as pyridine, quinoline, aniline, and trimethylamine are suggested. Nitro-phenols and their salts comprise the chief remaining members of this group. When present to the extent of less than 0.02 per cent.: *o*- and *p*-nitrophenols and the sodium salt of 2.4 dinitrophenol will prevent the growth of the dry-rot organism, *Coniphora cerebella*. "Sporocide" consists essentially of potassium o-dinitrocresylate. Any danger from explosion may be reduced by incorporating aromatic sulphonates with the metallic compounds of polynitrophenols (*Brit. Pat.*, 147,608, of 1920). In order to prevent the dinitro-phenol salt from attacking the iron of the impregnating vessel, salts such as alkali chromates, borax or disodium phosphate may be added. Alkyl or acyl polynitrophenols have been proposed—*e.g.*, acetyl dinitrophenol. Other compositions consist of dichlorbenzene and its homologues, dissolved in paraffin wax or naphthalene, and the condensation products of these chloro-compounds with the phenols of tar oil (*Brit. Pat.*, 20,260, of 1914, and *Ger. Pat.*, 302,531, of 1917).

Green-heart wood is particularly resistant to marine boring organisms. In order to ascertain whether this property is due to the texture of the wood or the presence in it of toxic substances, Barger has extracted the material with solvents such as alcohol, chloroform, and ammonia. The alcohol extract yielded an alkaloid-like substance similar to berberine, and experiments are now in progress on the preservative action of this material.

The Efficiency of Wood Preservatives.

In order to determine the relative efficiencies of various methods of impregnating sleepers for Indian railway work, an extensive series of tests has been carried out by the Indian

Railway Board (Technical Paper, 231, Simla). 9,000 sleepers and five preservative media were employed, these being "Powellising," treatment with zinc chloride followed by sealing with green tar oil, impregnation with a low content of creosote, and treatment with a mixture of solignum with Rangoon mineral oil and with a green creosote oil-fuel oil medium. The weight of evidence was in favour of using the creosote-fuel oil mixture impregnated by the full-cell process, although "Powellising" gave good results, especially in dry situations.

Many methods are used for testing the toxicity and efficiency of wood preservatives. Sawdust impregnated with an alcoholic solution of the preservative may be used as culture medium, and the actual loss in weight, due to the organism, measured. Using this method with various fractions of coal-tar creosote (7.5 per cent. tar acids by volume), it was found that the most toxic fraction was that with a boiling-point range 270°-315° C., a concentration of one per cent. of this being effective. The residue boiling above 355° C. (8 per cent.) was of little value (Schmitz and Zeller, *J. Ind. Eng. Chem.*, 1921). Another method is to innoculate a nutrient agar medium containing the preservative with the fungus. In some experiments on the fungus *Fomes annosus* in this way, it was demonstrated that the toxic action of beechwood tar is due to its content of phenolic substances. Compared with coal-tar creosote, that from beechwood tar was between two and three times as active, those from hardwood tar and the tar from the Douglas fir were about half as active, while soft wood tar creosote ("Spirittine") had about one-third the activity.

Water-gas tar distillates were less toxic than coal-tar creosote. Petroleum distillates have little or no toxic action. Fifty per cent. of diluent may be added to good quality creosote without appreciably affecting its toxicity towards this fungus. A composition containing about 25 per cent. dinitrophenol, tested by this method, was found to be ten times more toxic than 95 per cent. cresol (Humphrey and others, *J. Ind. Eng. Chem.*, 1915 and 1921). Similar results were obtained with the wood-boring organism *Xylotria*. Towards this, α-naphthol is many times more poisonous than phenol, while naphthalene and anthracene are practically non-toxic.

According to Moll, the poisoning action of salts, as measured against *Penicilium glaucum*, is an additive property of the ions, the following being the order of diminishing toxicity:—mercury, silver, cadmium, cyanogen, copper, zinc, iron, cobalt, chromium and fluorine. Most acid ions, magnesium, aluminium, alkali metals and alkaline earth metals are inactive (*Z. angew. Chem.*, 1920). The efficiency of wood preservatives is closely parallel to their antiseptic power, as measured by the dose required to render a gelatine broth sterile to the mycelium of *Penicilium*. In some experiments on the protection of some mine timber during a period of seven years, Nowotny (*Z. angew Chem.*, 1922), found that tar oil and "basilite" gave complete protection in concentrations of 3.7 and 0.2lb. per cubic foot respectively. Nitrophenols were fairly efficient, but mercuric silicate was inferior to "basilite." Sodium silicate alone or in admixture with lime was of no value. For the protection of green lumber, before kiln-drying, the Forest Products Laboratory of the United States recommends mixtures of sodium carbonate and bicarbonate as suitable antiseptic dips.

The Preservation of Wood Pulp.

More than 70 organisms have been isolated in mechanical wood pulp. One result of their life-processes is the conversion of the cellulose into an unstable form, leading to an estimated loss of from 5 to 10 per cent. of the pulp. The activities of these organisms leads to the deterioration of the finished paper. Thus, there is a decrease in the length of the pulp fibre, more size and bleach are needed, while the strength and colour of the finished paper are impaired. Only borax, sodium fluoride, and sodium dinitrophenolate are of commercial value as preservatives, the yellow colour produced by the latter being easily removed by washing. According to the investigations of the U.S. Forest Products Laboratory, when added to wet pulp containing 30 per cent. dry substance, 1.0 per cent. borax, 0.8 per cent. sodium fluoride, and 0.25 per cent. dinitrophenolate kept the pulp free from mould growth for 8, 12, and 13 months respectively (*Paper*, July 20, 1921). Carbonate and bichromate of sodium, although good preservatives, discolour the pulp. According to Bates (*Pulp and Paper Mag.*, 1921), sodium fluoride is the most satisfactory preservative, the addition of a one per cent. solution, in quantity to correspond with about ½ per cent. of fluoride on the dried pulp, maintaining the pulp intact for 18 months under adverse conditions. The chlorides of zinc and mercury, although they protect the pulp from disintegration due to decay, appear to stimulate a fungus producing discolouration.

A NEW GLASS-MAKING MACHINE.

AUTOMATIC MANUFACTURE OF GLASS BOTTLES.

AT a meeting of the Society of Engineers at Burlington House, London, on Monday, October 1, Mr. Alexander Ferguson gave a description of the new automatic machine for mass production of glass bottles, for which he has prepared designs. The machine has been given the name of the Cyclone furnace, and the claim is made that it allows 540 tons of glass to be made in 168 hours per week, or 120 bottles per minute. Whereas ordinary tanks usually require 100 tons of coal to 100 tons of glass, and in the best practice to date a great achievement has been 60 per cent. coal to glass, it is possible, with the Cyclone furnace, to use only 30 per cent. coal to glass, with a safety margin of 13¾ tons in each 100 tons glass in a furnace occupying 600 sq. ft. instead of the present 8,800 sq. ft., and yet leaving the ground area clear for any other purpose. Another feature of the plant is that it is claimed to be entirely automatic throughout, no skilled labour—outside the machine repair shop—being required after the chemist or glass maker has settled the batches for the glass required.

It should be pointed out that these machines have not yet been made on a commercial scale, the author admitting his inability to find a firm to take up their manufacture or to work them.

Ground Batch Material Fed into Whirling Gases.

The principal feature of the furnace is that the burners are so set as to give a whirling motion to the gases, which travel about 175ft. per second. The walls of the furnace are inclined from top to bottom and the batch material is ground to a mesh of about 60. Into these whirling gases the batch material is fed, and the author's description of the operation is that the molecules of glass, once formed, are cast forth from the whirling gases and coalesce into a liquid homogeneous paste and flow down the walls of the furnace like glucose under the influence of radiant heat. The glass passes on to the forehearth, from which it is gathered and delivered to the bottle-forming plant. The design of furnace was evolved during attempts at an economical method for the manufacture of giant telescope lenses of perfect homogeneity.

The next portion of the apparatus is that in which the molten glass is sucked up automatically and transferred to the moulds, which are mounted on the periphery of a large wheel. These rotating gatherers are so arranged as to suck up the desired quantity for the particular size bottle. The Cyclone machines occupy only one-eighth the area of the Owen's gatherer with three times the capacity, although the times in the moulds are identical.

Capital and Working Costs.

The total outlay on the machines—*i.e.*, gatherers, parisons, blowers, shapers, conveyers and lehr charges can be refunded in 5 years by an amortisation charge of little more than 3d. per gross of bottles at 120 per minute. The total capital cost of such a plant is put at less than that for a plant of one-fourth the size of the ordinary type, and amortisable over 5 years at 4d. per gross of bottles. The author recommends, also, that for real economy cement and glass should be made at the same time in similar plant with duplicate funnels and a cooling rotary for cement clinker; first, because the materials are identical, although in different proportions; and second, because the amount of CO_2 got from the large percentage of lime in cement greatly reduces the coal bill. It is calculated that the coal consumption to make 700 tons of cement and 540 tons of glass would only be 16½ per cent. fuel to products.

Mr. Ferguson, replying to a long discussion, said he had not been able to provide the money in order to instal this plant, but he had had every single part of it tested individually. He had been unable to find a capitalist willing to embark his money in the glass tank at the present moment.

THE MONTH IN ENGINEERING.

(Specially Contributed.)

Mercury Boilers and Turbines.—Within recent years many attempts have been made to devise a mercury boiler and turbine; that is to say, to use mercury instead of water in the boiler, and to drive the turbine by means of the vapour of boiling mercury. Some of the great difficulties of such a principle of power generation have recently been made public. In the first place, it is necessary to design a boiler so that the mercury will boil quietly without "bumping," since otherwise a very severe strain is imposed upon the boiler and its foundations. Again, since the boiling point of mercury is very much higher than that of water, considerably more trouble with expansion and contraction is encountered. Mercury vapour being extremely poisonous, the whole of the boiler and turbine circuit throughout must be absolutely leak-proof, an object by no means easy to attain. In one experimental plant, the whole of the joints in the circuit through which leakage could occur—with the solitary exception of where the revolving shaft of the turbine passes through the casing—are made absolutely tight by welding, and even where riveted joints are employed, these are finished off with oxy-acetylene welding. In the case of joints that have to be opened from time to time, these are also electrically welded, and have to be cut open by means of special pneumatic tools. It is also found necessary to use a room in which the floor is absolutely smooth and on a continuous slope, so that no slight pool of mercury can collect and give rise to traces of vapour in the air, whilst the most powerful ventilation is installed, and the attendants examined at very frequent intervals for any incipient trace of mercurial poisoning. It has been discovered in this connection that one of the best preventitives is to wash with strong sulphur soap, which prevents any trace of mercury sticking to the skin. There is no doubt that the mercury turbine represents a very high advance in efficiency, as compared with the steam turbine, if only the practical difficulties can be overcome.

The De-aerating of Boiler Feed-water.—As discussed in previous Notes, one of the results of the continued increase in the size of water-tube boilers for power-station work is the absolute necessity of de-aerating or "degassing" the feed-water, since in the case of water-tube boilers of over about 100,000lb. of water evaporated per hour, the minute quantity of dissolved air begins to exert a very serious corrosive effect. A very important paper has just been read on this subject by Mr. J. Weir, of Messrs. G. and J. Weir, Ltd., before the Koninklije Institut van Ingenieurs, in Holland. In a boiler feed-water circuit air can be absorbed by the water in three ways: (1) Leaky condenser tubes; (2) excessive aeration of the make-up water; and (3) leakage of air into the feed-water reservoir.

Leaky condenser tubes constitute one of the most serious problems, especially in marine engineering, and in this connection it is interesting to note that Messrs. G. and J. Weir, Ltd., have under consideration the manufacture of these tubes in solid drawn Monel metal, which should certainly prevent the corrosion of the tubes, although the initial cost would seem to be a formidable matter. One method of eliminating air in power-station work is to have an entirely closed circuit between the boiler, feed pump, feed tank, air-extraction pump and the feed pump, in which the boiler level are, however, many practical difficulties in endeavouring to use an ideal circuit of this description. The insertion of a stand-pipe and closed tank in the circuit between the water-extracton pump and the feed pump, in which the boiler level is regulated by a control valve, is only a partial solution of the problem, and Mr. Weir sugests a better method is to use an entirely external feed tank coming into action automatically when required. There is, however, no question that the principle of de-aeration is much simpler.

In Mr. Weir's paper, methods of de-aeration which depend on the principle of boiling the feed-water, and so getting rid of the dissolved air, are considered at length. The simplest form of such apparatus is that used on steamships, in which the feed-water passes from an open feed tank through a spray nozzle into a chamber, where it mixes with the exhaust steam, the pressure in this chamber being kept at that of the boiling mixture by a small pipe connection to the condenser, which also withdraws the liberated air. For land work, however, the tendency to-day is probably more towards using de-aerating plant, depending on the principle of passing water at any convenient temperature through iron or oxides of iron in a finely divided or almost collodial condition.

The New Consett Coking Plant.—The new "Wilputte" coke-oven installation at the Consett Iron Co., Ltd., Durham, is now rapidly approaching completion, and will be one of the most up-to-date coking plants in the United Kingdom, particularly noteworthy as it is constructed throughout of silica brick on the latest American principle, the bricks having been made by the Consett Company themselves. The plant consists of 60 regenerative ovens, with a complete Coppé by-product plant for benzol, ammonia, and tar recovery, having a capacity of 6,000 tons of coal per week. The latest principles in handling have also been adopted. On arrival at the oven the coal will be crushed by a hammer mill plant, handling 90 tons per hour, to a fineness of 80 per cent. through ¼in. mesh, and will then be raised by a 160ft. elevator to an overhead ferro-concrete bunker capable of holding 2,000 tons, the ovens being charged from this by a vertical type of charging car with four eccentric conical compartments. The dimensions of the ovens are 39ft. 5in. long by 1ft. 5¾in. wide, by 10ft. 6in. high, with 2½in. taper, and are intended for a carbonising period of 16-17 hours. The electric-driven discharge rams are of the most powerful description, the rams themselves being of mild steel 2ft. 11in. deep, with cast-iron racks, and the total time of discharge being 30 seconds. As with most silica brick ovens, the quenching is done separately, the charge passing into an electric-driven car and being taken direct to the quenching station.

The cooling, condensing, and by-product plant is also of the latest description, whilst between the coke-oven gas discharge, used for heating the ovens, and the ovens themselves, is a gas holder of 15,000 cub. ft. capacity, which acts as a reservoir to hold the gas for about 50 seconds between cutting off the gas on one side of the ovens and opening out the gas-burner valves at the other. There is also included four ferro-concrete liquor storage tanks, each holding 200 tons, and the Coppé benzol rectification plant for motor spirit is particularly efficient. It is noteworthy that practically no progress has hitherto been made in Great Britain with the use of the highly refractory silica brick, and all British coke ovens, with one or two exceptions, are constructed either of fireclay or semi silica brick, working at comparatively low temperatures. It may be pointed out that the tendency in modern American coke-oven practice is not only towards very high temperatures, made possible by the use of silica bricks, but also still further to increase in the size of the ovens, and there is now talk of carbonising 16-17 tons of coal at one charge in a period of only twelve hours.

The Trade Position.—The position during the past month, although grave, is yet somewhat more promising. This seems to be largely due to expectations as a result of the earthquake in Japan, and a large number of inquiries have been received—for example, for steel and galvanised iron. The general feeling on the London Iron and Steel Exchange is a little better, and a number of iron and steel shares continue to advance very slowly. The political situation is also perhaps a little clearer. Buyers, however, continue to hold off as much as possible, although a number of miscellaneous orders of some magnitude have been received in general engineering. Matters are a shade better on th Clyde, and several orders for new steamers have now been placed, although, of course, the position in shipbuilding generally is really deplorable. Railway material continues to be one of the bright spots, and further orders are being received for locomotives, waggons, rails, sleepers, and other material, whilst the electrical industry is also fairly good.

In the coal trade matters are rather quiet, and the future is a little uncertain because of the Ruhr situation and the possibility of the German output of coal being considerably increased in the near future, whilst, in addition, the American coal strike seems to have been largely settled, and at the same time the trouble between Italy and Greece has resulted in a reduction of business from the Mediterranean area. However, a number of the European markets are still very good, and the home demand is slowly increasing.

Canadian Fuel Problem.—A report from Sydney, N.S., intimates that the British Empire Steel Corporation will put into operation a battery of coke ovens, which were installed two years ago at a cost of several million dollars, but have been idle since erection, and will endeavour to market coke in Quebec and possibly also in Ontario as a substitute for anthracite coal. Coke is generally regarded as the best substitute for "hard" coal, and this development promises to bring Canada one step nearer to independence in respect of fuel.

RECENT ADVANCES IN COTTON DYEING.

NAPHTHOL A.S. AND ITS CONGENERS.

THE dyeing and printing of cotton by means of the production of insoluble azo colours directly on the fabric has been an operation of very great technical importance for over thirty years. Among the various colours that can be obtained by this process, the most important is undoubtedly paranitraniline red or "para red" as it is most frequently termed. To produce this colour the cotton either as yarn or woven cloth is steeped in a solution of β naphthol in caustic soda, dried uniformly and then transferred into a solution of diazotised paranitraniline. Coupling takes place between the diazo compound and the naphthol and the cotton becomes coloured a vivid red. With the possible exception of primuline red (in which the yellow substantive dyestuff primuline dyed on cotton is diazotised and the cotton then passed through an alkaline solution of β naphthol), para red affords the cheapest means of obtaining a bright fast red on cotton.

Progress in the Insoluble Azo Colours Prior to 1912.

Until the few years immediately preceding the war, the technology of para red dyeing was not marked by any striking advances. Improvements in detail were made it is true, such as the introduction of the use of oil products like Turkey red oil in the naphthol bath for the purpose of obtaining a brighter shade, and the addition of antimony salts or glucose to the alkaline naphtholate to prevent the oxidation of the naphthol to undesirable dinaphthyl compounds. Search was directed to the production of other shades by the same process, and a bright green especially was sought. Little success attended these investigations, the only two colours adopted by the dyeing trade, although on a much smaller scale than para red, being dianisidine blue (made by coupling β naphthol-impregnated cotton with a solution of tetrazotised dianisidine and after-treatment with a soluble copper salt) and naphthylamine claret or bordeaux (obtained by coupling β-naphthol-impregnated cotton with diazotised α naphthylamine).

The Introduction of Naphthol AS

About the year 1912, however, the German firm Chemische Fabrik Griesheim Elektron placed on the market a product known as naphthol AS, as an improvement upon β naphthol in the para red dyeing process. This naphthol AS was the anilide of β oxy-naphthoic acid and aroused instant interest amongst cotton dyers and calico printers. The claims made for it, were that its alkaline solution unlike that of β naphthol possessed a distinct affinity for the cotton fibre and thus lent itself better to the purpose of machine dyeing (*i.e.*, dyeing in a jigger instead of in a padding machine), and that the red produced was both more brilliant and faster than the ordinary para red.

As already stated this naphthol AS met with a ready welcome from dyers, but the war intervened before its large scale adoption became an accomplished fact. It appears, however, that during the war and in the years following the war, the Griesheim Elektron Company has been improving and increasing the knowledge of the properties of naphthol AS and of similar allied products. Some indication of the extent to which present knowledge has grown was afforded on Friday night last when Dr. Julius Rath, of the Griesheim-Elektron firm, read a paper to a special meeting of the Manchester Section of the Society of Dyers and Colourists. (Incidentally this may be noted as the first occasion since 1914 on which a German scientist has delivered a paper to a chemical society in England).

The Colloidal Nature of the New Compounds.

Dr. Rath's paper was entitled "Colloid Chemical Researches in Connection with Naphthol AS." The speaker pointed out that whereas an alkaline solution of β naphthol is practically non-colloidal, the corresponding solutions of naphthol AS are all very markedly colloidal in nature. This fact was easily and directly ascertained by examination of the solutions for Brownian movement under the ultramicroscope. There seemed no doubt, said Dr. Rath, that the absorptive affinity of the cotton fibre for these newer products was bound up with the colloidal nature of the latter. A series of products analogous to naphthol AS have been prepared, and it has been found that as their molecular complexity increases, the size of particle constituting the disperse phase in the colloidal solution increases and that the tendency to aggregation and the formation of insoluble precipitates also increases. It has been found to be generally true that as one ascends the series of these substituted compounds of β oxy naphthoic anilide with regard to molecular complexity one finds that the compounds become increasingly difficult to dissolve in caustic soda, increasingly liable to give insoluble precipitates from their alkaline solutions and capable of giving increasingly faster dyeings on cotton. The insolubilisation of these compounds is a definite disadvantage and proceeds from chemical as well as physical causes, but it has been found that whereas it is impossible to do anything to delay the undesirable chemical action, yet by the addition of formaldehyde and of a protective colloid such as glue to obviate the physical aggregation process, the life of the solutions may be very appreciably extended.

Dr. Rath concluded by giving an account of the newer products placed on the market by the Griesheim Elektron Company. Some were used merely as shading colours for the naphthol AS, one gave a bordeaux shade with diazotised paranitraniline and one naphthol ASSW gave, when coupled with the diazo compound of a special base marketed by the Griesheim firm, a very dark purplish blue, which for all practical purposes could be considered a black.

The Importance of the Naphthol AS Colours.

An interesting discussion followed Dr. Rath's paper. Professor A. G. Green pointed out that this new work should throw considerable light on the theory of cotton dyeing. In reply to one question, Dr. Rath said that although these new products possess a distinct affinity for the cotton fibre yet they had proved unsuitable for the dyeing of acetate silk, their molecules being too large to enter the extremely minute filaments of the cellulose acetate fibre. Mr. Schofield, who moved the vote of thanks to the lecturer, pointed out that the use of naphthol AS and its congeners was spreading rapidly, and that it was not beyond the bounds of possibility that they would in time become serious rivals to the vat colours in cotton dyeing. The most recent colour in the series and one which had not been mentioned by Dr. Rath, was a beautiful yellow (of a quinoline yellow shade). Mr. J. R. Hannay, who seconded the motion, said that the Chemische-Fabrik Griesheim Elektron had catered more efficiently for the dyer than for the calico printer.

ISOPROPYL ALCOHOL.*

PROPERTIES AND COMMERCIAL USES.

AS the chief claim of isopropyl alcohol to recognition as a valuable commercial commodity lies in its solvent and preservative properties, it seemed desirable to determine to what extent these characteristics are comparable with those of ethyl alcohol. References to the physiological action of isopropyl alcohol have occurred in increasing number during the past 2 or 3 years. Grant and Johns (*Am. J. Pharm.*, 1922, vol. 94, p. 418) performed tests which satisfied them that isopropyl alcohol could be safely used for irrigating wounds, rubbing on to the skin and scalp, and for local applications generally to the body surface. They used it in lotions for chapped hands and after shaving, in liniments, liquid soap, and in antiseptic solutions for the throat; to cleanse small wounds and to dry and harden the skin of the hands when swollen by hot water and alkali. Sponge baths were taken in isopropyl alcohol of about 50 per cent. concentration. Specimens were distributed to nurses and hospitals, and used, under medical supervision, for alcohol rubs on a number of patients. In no case was any injurious effect noted. In an intensive experiment five volunteers wore bandages saturated with undiluted isopropyl alcohol covering an area of about sixty square inches on the forearm for from 3 to 7 hours daily for four successive days, a total of 21 hours for each man. No harmful effects, either local or systematic, were noted.

J. Pohl (*Biochem. Z.*, 1921, 127, 67-71) concluded from tests made on dogs and rabbits that small non-harmful doses of isopropyl alcohol are largely oxidised in the body, and that when given in small doses over a long period there is no inhibition of growth. Boruttau (*Deut. Med. Wochschr.*, 1921, 47, 747-8) found that it produced about the same effects on rabbits as ethyl alcohol. Small amounts could be given to animals per mouth or subcutaneously in proper dilutions for prolonged periods without harm.

* From account by H. C. Fuller, of the Institute of Industrial Research, Washington, in *Chemical and Metallurgical Engineering*, Sept. 17, 1923.

Physiological Action Similar to that of Acetone.

The general observations of those who have studied the effects of isopropyl alcohol warrant the conclusion that the animal economy is capable of absorbing reasonable amounts of this substance without the accompaniment of toxic results. It is, without doubt, sufficiently innocuous to be employed as a solvent and a preservative in the formulation of certain types of medicines, liniments, embrocations, rubbing compounds, dentifrices, antiseptic mouth washes, hair tonics, bay rums, perfumes and toilet waters.

A series of intensive experiments conducted by the writer on lower animals and human beings has demonstrated that isopropyl alcohol has no deleterious action on the optical system. Its physiological action on the internal animal economy may be considered in general comparable with that of acetone, to which substance isopropyl alcohol is oxidised by metabolic changes. Acetone has enjoyed an unrestricted use for a long period, it is not a toxic substance, and the ingestion of isopropyl alcohol in the quantities that might enter the system through the administration of medicines and such food products as flavouring extracts would occasion no other reaction than that which might normally occur when the same quantity of acetone is consumed.

Superior to Ethyl Alcohol as a Germicide.

In tests against bacteria, increasing quantities of isopropyl alcohol were mixed with standard extracts broth and inoculated with *Bacillus typhosus*. After incubation, sub cultures were made whereby the disinfectant effect was determined. In the fermentation tests only the inhibitory values were recorded. These tests demonstrated the superiority of isopropyl alcohol over ethyl alcohol as a preservative agent and as a disinfectant.

Uses as Solvent in Pharmaceuticals and Medicinals.

Isopropyl alcohol is a clear, colourless liquid which when pure has but a slight odour. It boils between 81 and 83° C. It is miscible with water in all proportions and dissolves volatile oils, resins, many inorganic bodies, and a large number of organic compounds, alkaloids and the like.

As a solvent for preparing medicines and holding the active principles in solution, isopropyl alcohol has an almost unlimited field. A series of standard pharmaceuticals has been prepared and kept under observation for a long period without showing any change either in appearance or therapeutic value. These products include soap, liniment, spirit of camphor, aromatic spirit of ammonia, tincture of iodine, antiseptic liquid, alkaline antiseptic liquid and many others for which there are prescribed standards in the U.S. Pharmacopœia and National Formulary.

Massage and rubbing mixtures combining the virtues of camphor, thymol, menthol, and eucalyptol in isopropyl alcohol have been found to be stimulating and cooling to the skin and muscles.

For preparing mouth washes, isopropyl alcohol furnishes a satisfactory medicine for combining the characteristic oils such as gaultheria, eucalyptus, pine and coriander with thymol, menthol, phenol, cresol, boric acid, ammonium chloride, sodium benzoate, borax and potassium carbonate. Tooth washes made with soap, myrrh, oils of cassia, clove and those above mentioned, and coloured characteristically with cudbear, cochineal, rosolic acid and methyl orange can be made with isopropyl alcohol.

For all types of hair tonics, isopropyl alcohol can be employed to advantage as a solvent for the medication commonly employed such as resorcin, salicylic acid and quinine, the extracts of pilocarpus and sage, and the characteristic perfuming oils such as lavender, rosemary and bergamot. Isopropyl alcohol is an excellent solvent for the delicate essential oils, concentrates and artificial esters that are used in the multitude of colognes, perfumes, toilet waters and other preparations. The employment of a specially refined form of isopropyl alcohol will yield products equalling those made with Cologne spirits and free from the objection that now obtains in the employment of alcohol denatured with a varied assortment of medicaments which often put decided limitations on the use of the solvent.

Isopropyl alcohol is a remarkable dehydrating and constricting agent, acting in this respect fully as strongly as does absolute ethyl alcohol. Its use in the pathological laboratory for dehydrating tissues, sterilising instruments, dissolving stains, preserving specimens, etc., has been subjected to practical test and found satisfactory.

THE OUTLOOK FOR TEXTILE CHEMICALS.

SIR MAX MUSPRATT'S VIEWS.

SIR MAX MUSPRATT (chairman of the United Alkali Company), in the course of an address upon "The Essential Partnership of the Chemical and Dyeing Industry," delivered last week before the West Riding section of the Society of Dyers and Colourists, at Bradford, made some interesting comments upon the present situation and future outlook of the chemical and dyeing trades in relation to their products and supplies.

The Direct Utilisation of Chlorine.

Dealing with the position of the various chemicals used in the textile industries, Sir Max said there were enormous possibilities in the better utilisation of chlorine. It was a very moot point whether the large consumers of bleaching powder were not paying to the railway companies, to the makers of wooden casks, etc., an unnecessary amount of money, because many held the view that the right method to be adopted by bleaching-powder users of any considerable size was to buy liquid chlorine and make the liquor themselves on the spot. Potash was the only national source of uneasiness. During the war, however, we got through, and there was never a real shortage of the chemical in Britain. It was worked entirely on uneconomic lines, though, and he thought the position of potash was one of the weak spots in our economic system which it would be wise for all concerned in the textile, chemical, and dyeing industries to watch from year to year, because if there were any means of remedying it that should be done. Tin and zinc need not cause us any anxiety except in the event of an almost complete blockade.

Acetic Acid and Sodium Chlorate.

With regard to acetates and acetic acid, England was almost entirely dependent upon other countries. Fortunately, the sources of supply were widely distributed, but it was one of the weak points. There was a solution in sight, although it was not yet on economic lines. Synthetic acetic acid had come to stay, and it was up to either the dyeing industry or chemical manufacturers to see that at any rate our nucleus of synthetic acid was made in this country. The dyeing industry need not be very anxious about sodium chlorate, and economically we might take it that Britain, on the heavy chemical side, was in a position to meet any competition in the world, and to supply the dyeing industry with what it required on reasonable terms.

Co-operation Between the Industries.

Reasonable terms constituted the real test of the partnership between the industries. The ordinary old-fashioned haggling was not good enough. Each must have sufficient knowledge and information concerning the other, and by coming together and finding what the real problems were, it would be possible, in 60 per cent. of the cases, to obtain economic advantage for both, without any friction or idea that one must be overcharged or the other underpaid. In regard to synthetic ammonia, Brunner, Mond and Co. had taken over works established during the war, and he felt certain that there would be a plant in the country capable of making synthetic ammonia in time of stress. Our real strength, however, lay in our gasworks and coke ovens. It was highly desirable, however, that there should be a synthetic ammonia works in Britain, and the firm of Brunner, Mond had shouldered the responsibility of seeing that such was established.

THE CHILEAN COPPER INDUSTRY.

EXPANSION OF OUTPUT IN 1922.

IN a report on the financial and industrial conditions in Chile, dated April, 1923, and published by the Department of Overseas Trade, Mr. J. M. Macleod, British Consul-General at Valparaiso, states that during 1922 there has been renewed activity in the copper industry, and the large mining concerns are arranging to increase their production very considerably. The Chile Exploration Co., who own the important deposits at Chuquicamata, province of Antofagasta, are at present treating daily about 14,000 tons of ore of 1.63 per cent. copper, and they are arranging to increase this to 21,000 tons, and ultimately, when the copper industry is more normal, they will be able to handle up to

35,000 tons daily. The Braden Copper Company, owning the Teniente Mine near Rancagua, are handling at the time of writing about 7,000 tons daily of 2.16 per cent. ore. The copper ore at Chuquicamata is treated with sulphuric acid, and then submitted to the process of electrolysis, after which the resultant copper, then containing from 80 to 90 per cent. of pure copper, is placed into a refiner and "poled," pure copper being obtained and poured into moulds, and exported in the form of bars or slabs. The copper ore at "Teniente," owing to its different character, cannot be treated by the electrolytic process. It is thrown into large furnaces, and smelted into matte containing approximately 50 per cent. copper. The matte is then placed in a convertor, and pure copper in bars and slabs is obtained ready for export. Both the Chile Exploration Co. and the Braden Copper Co. are controlled by the Guggenheim interests in New York.

Progress of the Anaconda Company.

The Anaconda Company, one of the Guggenheim's principal competitors in the copper market, are intensifying the preparatory work at their mine, which is situated inland of Chanaral, province of Atacama. It is reputed to be larger than Chuquicamata, but the difficulties of exploitation are far greater owing to the mine being situated at an altitude of something like 12,000 feet, and a considerable distance from the sea coast. The company has spent several millions of U.S. gold dollars on the preparatory work, including the construction of a special port, Barquitos, a little to the south of Chanaral, and also a railway from the mine to join up with the longitudinal railway at the Pueblo Hundido station, from whence there is a branch line belonging to the state, to the coast at Chanaral. The exploitation at Calera (Las Guias) has been entirely abandoned, it having been found to be unprofitable to go ahead with the scheme.

Export Statistics.

Chile occupies second place in the world for copper production, and probably when Chuquicamata, Braden and Potrerrillos are working at full capacity she will be the leading copper producing country in the world. According to Government statistics, exports of copper ingots amounted in 1920 to 85,165 tons, 53,425 tons in 1921, and 109,420 tons in 1922. Exports of copper ore rose from 24,769 tons in 1920 to 69,248 tons in 1921 and 116,645 tons in 1922.

NOTES ON THE ITALIAN CHEMICAL INDUSTRY.

[From Our Own Correspondent.]

Genoa, September 29.

General News.—5,480 workpeople were unemployed in the Italian chemical industry during the month of June, as compared with 5,394 in May, 4,750 in April, 4,790 in March, 4,886 in February, 4,881 in January, and 5,591 in December of the past year. By a recent arrangement an unloading tariff of 6 lire has been fixed at the port of Venice for lump pyrites, with a slight increase for friable or powdery material. At the port of Leghorn the unloading tariff for phosphates has been brought to 5.20 lire per ton, for sulphur to 5.60 lire, and for saltpetre to 4.20 lire. Data collected by the Associazione Bancaria Italiana regarding the activities of limited companies show that during August 171 concerns were founded with a total capital of 319,255,700 lire, and 93 increases of capital took place for 221,027,860 lire. During the same period there were 34 liquidations for 38,658,000 lire, and thirty reductions of capital for 104,440,360 lire. The net total increase in investments was 397,725,200 lire.

Italian Overseas Chemical Trade.—During the first three weeks of August imports into Genoa included 839 tons of kaolin, 20,645 tons of phosphate mineral, 375 tons of copra, 1,421 tons of unspecified chemicals, 85 tons of colours and varnishes, 280 tons of tallow, 2,670 tons of quebracho extract, 2,200 tons of naphtha, 800 tons of resin, 1,715 tons of lubricating oils and fats, 1,250 tons of paraffin, 3,587 tons of manganese, 2,600 tons of iron pyrites, 670 tons of nitrate of soda, and 4,063 tons of myrabolams. During the last week of August there were discharged in the port of Trieste 1,500 tons of benzine, from New York, and 3,800 tons of phosphates from Bona. During 1922 about 128,147 tons of fertiliser materials arrived at Venice, against 188,003 tons in 1913. The present trade of this port represents sixty per cent. of its pre-war extent. The imports of fertilisers and coal, however, have now nearly reached the amounts ruling at the beginning of 1914.

Italian Production Statistics. — Italian production of benzine reached 1,243 tons in 1921, against 1,563 tons in 1920, 1,657 tons in 1919, 2,233 tons in 1918, 2,150 tons in 1917, 3,060 tons in 1913, and 2,779 tons in 1910. The production of asphalt and bitumen in 1921 reached 33,601 tons, against 28,031 tons in 1920, 14,237 in 1919, 7,625 tons in 1918, 13,608 tons in 1917, 56,324 tons in 1913, and 41,033 tons in 1910. The Montecatini Combine produces 50,000 tons of the 75,000 tons of copper sulphate required by Italy, and 45,000 tons of sulphur against a total requirement of 80,000 tons.

The Position of the Calcium Citrate Industry. — In 1908 the Camera Agrumaria was established with the object of assisting the many small Italian citrate-of-lime producers, and protecting them against the large combines buying the product. Instead, however, of trying to ease matters by making the profit of the individual producers depend on their actual work, the Camera Agrumaria assumed from the beginning the main features of a State organisation, furnished with full powers. Their practice was to receive into stock all the citrate of lime of the producers, and to advance to the latter two-thirds of the ruling selling price. The product was thus delivered to the Camera Agrumaria, which had to look after its sale, and when this had taken place, the producer was paid the other third of the price, against withdrawal and cancellation of a credit note. During the war the producers were unwilling to continue under a similar arrangement, and exerted pressure upon the Government. The matter ended by a decree being issued in 1919 fixing a lower selling price, which had, however, to be paid in full at the time of the transference of stocks. The selling price was calculated on the cost of production plus a small margin of profit for the producers and manufacturers. In this way all the trading risks were transferred to the Camera Agrumaria, for while the latter body could not refuse payment for the citrate brought in by the producers, it could only sell a portion of it, while the warehouses remained overstocked. Since the Armistice matters have but little improved, and the Camera Agrumaria remains yet the exclusive seller of citrate of lime, the largest banks being obliged to finance it *bon gré mal gré*, through agreements made with the Government.

Improved Lignite Carbonisation Process. — Professor Mondello, after carying out numerous experiments in the works of Sesto Fiorentino on some Tuscan lignites, has come to the conclusion that these can be best utilised by effecting their carbonisation with superheated steam. The results obtained in this case, which will be exploited by a syndicate represented by the firm P. Zomer and Co., of Florence, are of great importance to the Italian mineral industry. The lignites and turf treated with superheated steam are decomposed into numerous by-products, leaving a residue composed entirely of desulphurised and dephosphorised coke, having a calorific value higher than 6,500 calories. The yield of coke reaches forty-five per cent. by weight, and the yields of paraffin-rich tar and of ammoniacal liquor are just double those obtained from lignite carbonised by a direct fire.

Crude Sicilian Sulphur for Agricultural Purposes. — The greater part of the Sicilian sulphur now produced is employed in agriculture, and here not only ground sulphur is demanded, but refined sulphur also. For this reason numerous refining plants have been established in Sicily, the number in 1921 reaching twenty-four, of which fifteen were in the province of Catania, eight in the province of Girgenti, and one in the province of Palermo, with a production of 36,523 tons per year, valued at 33,570,917 lire. The use of refined sulphur for agricultural purposes is, however, considered unnecessary, as from time immemorial the small vine cultivators of Sicily have used only the crude ground mineral, and this practice has now developed in all the vine regions of Southern Italy. In some sulphur mines in Southern Italy plant has been erected for grinding the crude sulphur mineral. Minerals with only twenty per cent. of sulphur have given good results for viticultural purposes.

Company News.—The Milan firm "Società Acetato di Calce Industrie Derivati" has decided to increase its capital from 150,000 to 300,000 lire. At Borgo S. Donnino the firm "Società Anonima Tito Campanini e C." has been founded with a capital of 450,000 lire in 4,500 shares of 100 lire; this is a limited company formed from an old-established chemical manufacturing firm. At Chiusa Pesio, near Cuneo, the "Società Anonima Prodotti Tannici Dott. Allassia Bartaloni e Compagni" has been formed with a capital of 100,000 lire, for the production of tanning extracts. At Turin,

the firm "Industria Chimica Subalpina," with a capital of 60,000 lire, has been established for trade in general chemicals. With the object of producing synthetic ammonia on a very large scale there has been founded at Milan the firm of Azogeno, with a capital of 10,000,000 lire. The firm of R. e G. Fratelli Incorpora has been formed at Palermo with a capital of 200,000 lire, for the production of and trade in citrate of magnesia.

The report of the Naples sugar works "Società Valsacco per la Fabbricazione dello Zucchero" to March last shows a net profit of 482,630 lire on a capital of three million lire. The "Unione Produttori e Consumatori di Materie Coloranti," of Milan, made during its past financial year a profit of 186,734 lire on a capital of two million lire. The fertiliser works "Società Veneta Concimi e Prodotti Chimici CITA," of Vicenza, is raising its capital from 2½ million to 5 million lire. The sugar works "Zuccherificio e Raffineria di Pontelongo" in conjunction with the "Distilleria di Cavarzere" has established the "Società Veneta per l'Industria degli Zuccheria" at Este. This latter factory will have a sugar works and refinery, with a potential daily consumption of one million kilos. of beetroots. The last balance-sheet of the Sicilian sulphur extracting and working concern "Sikelia-Società Anonima Esercizio Miniere ed Industria Zolfi of Catania" showed a loss of 185,766 lire on the capital of one million lire. At Genoa there was founded the firm of "Barum-già Cadenaccio Gianolio e C.," with a capital of 400,000 lire in 400 shares of 1,000 lire, for the production of and trade in barytes. At an extraordinary meeting of the "Oleificio Bergamasco," Bergamo, near Milan, it was decided to increase the capital from ten to fifteen million lire by the issue of further shares.

THE SHIPMENT OF RUBBER LATEX.

ATTITUDE OF BRITISH PLANTERS.

IN a paper before the Institution of the Rubber Industry on Monday, Mr. Cyril Baxendale, an old rubber planter, gave a fascinating account, illustrated by coloured lantern slides, of the conditions under which rubber and other planters had to live in the old days. There is no need for us to deal with the paper in detail, but there is a point of some technical interest which arose in the short discussion which followed the reading of the paper. Some information was asked for concerning the possible developments in the direct use of latex. Mr. Baxendale replied that this was a matter which must rest largely with the people in this country, and not with the planter. As a planter he would have no difficulty in keeping the rubber in the latex form, but there would be wastage in the matter of freight if it were shipped to this country. At the same time, it would not be a very serious matter for the planting company to abolish its present factory and get rid of its machinery if it were decided to send the rubber home in the form of latex. It would first be necessary, however, to ascertain that there would be a sufficient market in this country.

It was a simple matter for a great organisation like the United States General Rubber Company, which had some 50,000 acres all practically in bearing at the present time, in Sumatra, to say nothing of their interests elsewhere, to ship latex because they would be dealing with it in their own factories in America, and he had been told that shipments of 90,000 gallons were being made. British rubber planters, however, would be rather shy about sending home large shipments of latex to be sold in the open market.

OUR BOOKSHELF.

Radio-Activity. By Kasimir Fajans (Professor of Physical Chemistry in the University of Munich). Translated from the Fourth German Edition by T. S. Wheeler, B.Sc., A.R.C.Sc.I., A.I.C., and W. G. King. 1923: London: Methuen and Co., Ltd.; price 8s. 6d. net.

The first German edition of this work was published in 1919, and the fact that a fourth edition was called for by the beginning of 1922 is ample evidence of its inherent merit. Whilst the subject matter is presented in such a manner that those possessing but an elementary knowledge of physics and chemistry can follow the development of this important branch of modern scientific progress, the work should none the less be welcome by those physicists and chemists who have not opportunity to keep pace with the rapid development of the subject by reference to the original literature. Commencing with the study of the chemical elements previous to the discovery of radioactivity, the book deals successively with the radioactive transformations of the elements, the chemistry of the radio-elements, the displacement laws and their application, and the end products of the disintegration series. The subject of isotopy is dealt with at great length, special attention being given to the more important recent work. The final chapter, entitled "Retrospect and Prospects," is useful and suggestive. The section giving references and notes as a guide to further study of radioactivity and isotopy is comprehensive, and should be of very material aid to advanced students. In the present English translation, which has been revised by the author, the subject matter has been brought quite up to date—as far as the discovery of the new element hafnium. The volume is well produced and illustrated by diagrams. The translators are to be congratulated on a valuable piece of work, and if they have not quite succeeded in altogether avoiding the idiomatic construction peculiar to the original German, they have come very near to achieving this very difficult task.

Chemical Engineering Catalogue (1923). Published by the Chemical Catalog Company, Inc., 19, East 24th Street, New York (leased 3.50 dollars foreign countries).

The volume is published annually under the supervision of an official committee appointed by the American Institute of Chemical Engineers, the American Chemical Society, and the Society of Chemical Industry. A curious arrangement is that the volume is subject to recall being leased only. Its make-up consists of 207 pages of classified index of products, equipment and materials covering every conceivable product made in the industry and all plant, devices and material incidental to it. This is followed by 721 pages of illustrated catalogue matter, in which American chemical engineers and other manufacturers describe the uses and advantages and general details of plant for chemical purposes. It is indeed quite a unique publication, and probably the only one in existence which you could place on your desk and from it map out the whole of the equipment for quite a considerable chemical works without writing for and handling a hundred or two separate catalogues. The volume is completed with a large Technical Books Index and Catalogue, and the whole could only have been produced by the investment of a huge sum of money by American manufacturers for the advertisement it gives them.

Practical Chemistry for High Schools. By H. B. Dunnicliff, M.A. (Cantab.), B.Sc. (Lond.), F.I.C., Professor of Chemistry at the Government College, Lahore, India. 1923: London: Macmillan and Co., Ltd.; price 5s. net.

An eminently practical little volume. The student is familiarised from the outset with the fundamentals of chemical technique and of the fitting up of simple apparatus. In the second lesson, for example, the young student is taught to make a wash-bottle with the concomitant operations of glass-tube cutting, glass-tube bending, and cork boring, the instruction being given in great detail. The early introduction of the use of the burette and pipette is a matter in which we think the author has adopted a wise policy. The preparations, properties, and analytical reactions of the commoner non-metallic and metallic elements and compounds are fully described, and are followed by the systematic tests for the acids and metals. The fundamentals of quantitative analysis, both gravimetric and volumetric, are imparted in a series of well-chosen examples.

A First Course in Machine Construction and Drawing. T. M. Naylor, B.Sc., A.M.I.C.E., A.M.I.M.E., Eng.-Lt. R.N., and W. Tattersall, Assoc. M.C.T., A.M.I.M.E. London: H. F. and G. Witherby; 6s. net.

For the use of students and junior draughtsmen commencing the study of engineering. The authors lay stress upon the combination of an experienced teacher, models, and text-book, the latter up to now having been unavailable. The general arrangement—sketches on one page faced with reading matter relative to them on the other—is undoubtedly a great advantage. Ample space is provided for notes, and there can be no doubt about the more rapid progress which students will be able to make where this book is used. Such a book must implant sound mechanical foundation.

ITEMS OF INTEREST.

Broken Hill Mine to be Sold.—A Melbourne telegram states that the shareholders of the Broken Hill Block 10 Company have authorised the directors to sell the mine.

Higher Coal Output.—The coal output at the mines of Great Britain for the week ended September 22 was 5,504,300 tons, against 5,244,700 tons for the previous week, and 5,143,900 for the corresponding week last year.

Tariff Notes.—The Fijian export duty on copra has been abolished.—The export of gum copal is now permitted from Sierra Leone.—Anthraquinone can now be imported into Madagascar duty free.—The Polish excise duties on alcohol and acetic acid have been increased.

Rhodesia Mineral Output. — The British South Africa Company announces the following mineral output from Southern Rhodesia during August: Gold, 53,256oz.; silver, 14,114oz.; coal, 61,772 tons; chrome ore, 789 tons; copper, 224 tons; asbestos, 2,020 tons; arsenic, 65 tons.

Modern Sewage System for Japan.—The Acting British Consul at Osaka reports that the Municipality of that city propose to construct a modern sewage system at an estimated cost of £15,000,000. It should be understood, states the Board of Trade *Journal*, that this information was despatched from Japan before the recent catastrophe.

Standardisation of American Dyestuffs.—The colour laboratory of the United States Bureau of Standards under the leadership of Dr. Appel is trying to find a basis of standardisation for the more important colours, which are manufactured by more than one American firm. At present wide variations exist in strength and purity.

Cement Trade Development.—The Humber Portland Cement Company, Ltd., have issued a circular to the shareholders stating they have received an offer from G. and T. Earle, Ltd., Hull, to purchase the whole of their issued ordinary shares at 30s. 3d. per share. The directors, who either hold or directly represent some 200,000 ordinary shares, are in favour of accepting the offer.

Magnesium Perchlorate as a Dehydrating Agent.—Magnesium perchlorate trihydrate is so efficient a dehydrating agent that, according to G. F. Smith, M. Brown, and J. F. Ross, it may be used in the place of phosphorus pentoxide in the combustion method for determining carbon in steel and carbon and hydrogen in organic compounds. It will absorb 30 per cent. of its weight of water.

British Sugar Industry. — In connection with the proposal to inaugurate a sugar beet factory in Worcestershire, it was announced last week that arrangements for a factory to operate in 1924 were well in hand. Of the required sum of £320,000., promises for £205,000. had been received, and provisional arrangements for the supply of the factory machinery and expert assistance for manufacturing operations had been made.

The Institute of Metals. — The Institute of Metals has just issued its programme of meetings and lectures for the Session 1923-24. There are over thirty lectures and addresses to be given before the Institute's local sections in Birmingham, Glasgow, London, Newcastle-on-Tyne, Sheffield, and Swansea, as well as at meetings of the parent Institute, one of the latter including a lecture by Dr. F. W. Aston, F.R.S., which is to form part of the proceedings of next year's Empire Congress of Mining and Metallurgy.

Greek Soap Trade.—The production of soap is the third largest export manufacturing industry in Greece, ranking next to the olive-oil and wine industries. Practically all the soap normally exported from the country goes to Turkey, Jugoslavia, Bulgaria, North Africa, and other near-by countries. Statistics furnished by the American Commercial Attaché at Athens show that during last year soap was the sixth largest item of Greek export, totalling 7,659,660kilos. In 1921, however, shipments of soap totalled 9,420,781kilos. In general, Greek soap factories are located in districts producing the greatest quantities of olive oil. A large part of the soap produced contains no ingredients other than low-grade olive oil, olive stone oil, and caustic soda. Large quantities of the fancy grades are imported from England, France, and Italy, England furnishing the largest amount. Last year Greece imported 133,690kilos. of soap, as compared with 206,081kilos. in 1921.

Business Notice. — The British and Foreign Metal and Chemical Company, Ltd., of Newcastle-upon-Tyne, have been appointed the sole selling agents for Maastricht lithopones and zinc oxides for shipment to India, Japan, and China.

Huge Barytes Crystal.—In the Silver Band barytes mine, at Hilton, near Appleby, miners recently dug out a crystal weighing close upon 1cwt., composed of practically pure barium sulphate. It is intended to present it to a museum.

Czecho-Slovakia and Reparation Dyes.—It is reported that the Czech Government has applied to the French command in the Ruhr to confiscate a further quantity of German dyestuffs owing to Czecho-Slovakia as non-delivered reparations.

Death from Arseniuretted Hydrogen.—At the resumed inquest on E. G. Wright, employed at Fry's Metal Foundry, Blackfriars, it was shown that the man died as a result of inhaling arseniuretted hydrogen given off from certain residue metal which had come into contact with rain water. The Coroner found that death was due to misadventure.

Russia and German Dyestuffs.—The Interessengemeinschaft is evincing great reluctance to meet the demands of the Russian dye trust for intermediate products, but is willing to supply the finished colours to the best of its capacity. Before the war Germany owned factories in Russia which finished the dyestuffs from imported German intermediates.

Fire.—Three men were seriously burned in a fire which occurred on Wednesday at the Brierley Hill (Staffordshire) works of Messrs. Constable, Hart and Co., tarmac manufacturers. Tar leaking from a still caught fire, and while the injured men, with others, were trying to damp down the flames there was an explosion, and the men were enveloped in flames.

Canadian Trade Marks' Registration. — The Canadian High Commissioner states that since Canada has notified her adherence, as from September 1, to the International Convention of 1911 for the Protection of Industrial Property, Canadian trade marks can now be registered in Belgium either by application to Berne, or directly at Brussels, in the usual way.

Cheaper Coke in Midlands.—Midland blast-furnaces are to get cheaper coke during October. For some months Lancashire, Yorkshire, Derbyshire, Nottinghamshire, and Staffordshire cokeries have been charging 26s. at the ovens to home trade. A reduction of 2s. has been accepted by iron-trade representatives on the promise of an early review of the situation.

British Trade with India.—Mr. T. M. Ainscough, Senior Trade Commissioner in India, is at present in this country on an official visit, and will be in attendance at the Department of Overseas Trade during October for the purpose of interviewing manufacturers and merchants interested in trade with India. Such interviews will only be given by appointment, and all applications, quoting the reference 4814 T.G., should be addressed to the Comptroller-General, Department of Overseas Trade, 35, Old Queen Street, Westminster, S.W. 1.

Change of Address.—Whiffen and Sons, Ltd., announce that as from October 1 the factory and mills of George Atkinson and Co., known as the Aldersgate Chemical Works, at Southall, are removed to New Riverside premises at Carnwath Road, Fulham. The city offices and warehouse, formerly at 31-32, St. Andrew's Hill, London, E.C., are also transferred to Fulham. Telephone: Putney 3385, and telegrams "Camphor, London."—The new address of the British Carbide Factories is Bank Street, Clayton, Manchester.—The Lautaro Nitrate Co., Ltd., announce the removal of their offices to Furness House, 53-54, Leadenhall Street, London, E.C. 3. Telephone: Avenue 6104.

Obituary.—We regret to announce the death at the age of 82 of Professor Herbert McLeod, F.R.S., which occurred at his house in Richmond on Monday last. The late Professor McLeod was a student of Hoffmann and E. Frankland and was distinguished as a chemist, physicist and more particularly as a scientific bibliographer. He held the Professorship of Chemistry at Cooper's Hill for over thirty years. His great work however was in connection with the "Catalogue of Scientific Papers," published by the Royal Society. The task was gigantic and Professor McLeod undertook the labour of directing the staff of compilers and of arranging and editing their work.

Personal.—Upon his final retirement from the direction of the research laboratories of the British Dyestuffs Corporation, Professor A. G. Green was on Friday last presented by his staff of thirty chemists with a handsome library chair as a token of respect and their deep regard for him as a chemist and a leader. The presentation was made by Mr. G. H. Frank, supported by Mr. H. F. Oxley.—The Priestley Medal has been awarded to Dr. Ira Remsen, of John Hopkins University, during the meeting of the American Chemical Society at Milwaukee.

A New Zinc Chloride Antiseptic.—J. W. Howard and F. D. Stimpert described to the American Chemical Society at the recent annual meeting at Milwaukee the preparation, properties, and antiseptic efficiency of the zinc chloride salt of aniline. This salt was prepared by combining zinc chloride and aniline in molecular quantities and extracting the reaction mixture with boiling 95 per cent. alcohol. Studies on *Staphylococcus aureus* indicate that the salt in 0.6 per cent. solution retards growth up to 25mins. and will destroy in 30mins. Comparing with aniline and zinc chloride of the same concentration, it shows a stronger antiseptic action.

The Action of Acetylene on Phenols.—Acetylene in the presence of sulphuric acid and a mercury salt readily condenses with phenols to form ethylidene compounds. H. Wenzke and J. A. Nieuwland have worked on the subject, and in a communication of their results to the American Chemical Society, state that the position of linkage is usually para whenever that position is unoccupied. The tendency to form an aromatic acetal is slight, β-naphthol being the only compound that reacts in that way. The reaction with acetylene continues even after the theoretical quantity of 1 mol. of acetylene to 2 mols of phenol has been absorbed. A tarry, resinous body is formed when an excess of phenol is absorbed. The presence of negative groups in the benzene ring as NO_2, SO_2OH, COOH prevents the reaction with acetylene. The phenol ethers, anisol, and phenetol do not react with acetylene. Most of the condensation products polymerised on heating or on long standing to form insoluble bodies.

Power Alcohol in France.—The law which was passed six months ago requiring importers of petrol and other oils for fuel to purchase from the State a quantity of power alcohol equal to 10 per cent. of the quantity of oil imported the previous month has now come into operation. A licence has to be obtained to import oils, and its continuance depends upon the monthly purchase of alcohol. The law was passed to ensure the absorption of alcohol made from grain and beet-root, which is a monopoly of the State, with the idea of cheapening the spirit for industrial purposes and replacing, as far as possible, imported petrol; but until some really commercial process of dehydrating alcohol is introduced, it is doubtful whether the State can enforce a mixture which is generally recognised as inferior to petrol, although an equal mixture of alcohol and petrol gives quite satisfactory results. The future of alcohol lies more particularly in its cost, and at present it can only be sold cheaply at the expense of the ratepayers. The new law is an attempt to enforce the use of a home-distilled spirit with a view to the ultimate employment of a "national fuel," and the effort of the State to compel consumers to use a product of which it has a monopoly will be watched with interest.—*Engineer.*

Gravimetric Estimation of Nitric Acid. — Catalytic reduction of α-naphthonitril gives α-dinaphthodimethylamine $(C_{10}H_7.CH_2)_2NH$. The nitrate of this base is quite insoluble in water (100 c.c. dissolves 0.00004 gramme at 24° C.). According to H. Rupe and F. Becherer (*Helv. Chim Acta*, 1923, 6, 674), for the estimation of nitric acid or nitrate, the dilute, boiling solution containing a little free sulphuric acid is treated with a 10 per cent. solution of the base in 50 per cent. acetic acid. The precipitant is used after standing on the water bath till clear, because the acetate crystallises out in the cold at the above concentration. The nitrate solution remains clear at first, but, on cooling, the nitrate of the base deposits quantitatively in flaky crystals. The precipitate is collected on a Gooch crucible, washed with cold water, dried, and weighed. Sulphate and phosphate do not interfere, but the chloride is less soluble. The limit of sensitiveness for the detection of nitric acid by precipitation with the new reagent is given at about 1 : 1,000,000. The qualitative test is carried out in the cold; very dilute nitrate solutions give an opalescence, which on standing develops into a precipitate.—*The Analyst.*

Decomposition of Anthraquinone by Heat.—The action of dry heat and steam at atmospheric and elvated pressures has shown, state H. F. Lewis and S. Schaffer, that there is a definite point beyond which anthraquinone begins to decompose rather rapidly. These upper temperature limits of stability approach 450° C. with an air pressure of 35 pounds, 400° C. with a steam pressure of 35 pounds, and 375° C. with a pressure of 30 pounds of oxygen. A temperature of 500° C. decomposes anthraquinone at such a rate that at the end of eight hours approximately 80 per cent. of the original anthraquinone has been decomposed. A study has been made of the decomposition products which shows that there are at least two new substances produced—one extremely stable and the other very unstable; the stable substance being of the nature of hydroxy-anthraquinone and the unstable substance indicating the condensation of two or more molecules of anthraquinone.

COMING EVENTS.

Society of Chemical Industry (Manchester Section).—Meeting, **Friday, October 5,** at **7 p.m.,** at the Textile Institute, 16, St. Mary's Parsonage. Chairman's address: "Recent Progress in Chemistry," by Dr. H. Levinstein.

Manchester Literary and Philosophical Society.—Meeting, **Tuesday, October 9,** at **6 p.m.** Presidential address: "Coal-dust explosions at the Mines Department Experimental Station at Eskmeals," by Dr. H. B. Dixon.

Institute of Metals (N.-E. Coast Section).—Meeting, **Tuesday, October 9,** at **7.30 p.m.,** at Armstrong College, Newcastle-on-Tyne. Chairman's address by Professor H. Louis. —**(London Section):** Meeting, **Thursday, October 11,** at **8 p.m.,** at the Institute of Marine Engineers, The Minories, E. 1. Chairman's address by Dr. D. Hanson.—**(Sheffield Section):** Meeting, **Friday, October 12** at **7.30 p.m.,** at the University, St. George's Square. Paper: "Electric Resistance Furnaces," by A. G. Lobley.—**(Swansea Section):** Meeting, **Friday, October 12,** at **7.15 p.m.,** at University College, Singleton Park. Chairman's address by E. E. Dendy.—**(Birmingham Section):** Meeting, **Tuesday, October 16,** at **7 p.m.,** at the Chamber of Commerce, New Street. Chairman's address by Dr. F. Johnson —**(Scottish Section):** Meeting, **Friday, October 19,** at **7.30 p.m.,** at 39, Elmbank Crescent, Glasgow. Paper: "Large Metallic Crystals and Some of Their Properties," by Professor H. C. H. Carpenter.

Institution of Welding Engineers. — Meeting, **Wednesday, October 10,** at **8 p.m.,** at the Holborn Restaurant, London. Papers on Electric Welding and Gas Welding to be read.

Institute of Chemistry (Bristol Section).—Meeting, **Thursday, October 11,** at **5.30 p.m.,** at the University, Woodlands Road. Address: "Some of the More Important Factors Making for Success in Chemical Practice," by the President, A. Chaston Chapman.—**(Huddersfield Section):** Annual general meeting, **Thursday, October 11.**

Society of Dyers and Colourists (Manchester Junior Section).—Meeting, **Friday, October 12,** at **7.30 p.m.** Paper: "The British Colour Industry," by Dr. H. Levinstein.

Institution of the Rubber Industry (Manchester Section). —Meeting, **Monday, October 15,** at **7.30 p.m.,** at the Midland Hotel. Discussion: "Rubber Machinery," to be opened by H. C. Young.

Hull Chemical and Engineering Society.—Meeting, **Tuesday, October 16,** at **7.45 p.m.,** at the Photographic Society's Rooms, Grey Street. Paper: "Spinning Tops and Gyroscopic Motion," by L. C. Perkin.

Institute of Chemistry.—Conference, **Thursday** to **Saturday, October 18** to **20,** at Liverpool. Thursday, reception and dinner; Friday, presidential address by A. Chaston Chapman, at 10 a.m.—**(South Wales Section):** Meeting, **Friday, October 19.**

Textile Institute.—Autumn Conference, **October 18** and **19,** at Leicester. The chief papers will be: "Artificial Silks," by P. E. King; and "The Application of Dyes to Fibres and Fabrics," by Professor J. Thorpe.

Society of Dyers and Colourists (Manchester Section).—Meeting, **Friday, October 19,** at **7 p.m.,** at 36, George Street. Paper: "Some Aspects of the Theory of Quinones," by Professor R. Robinson.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

British Isinglass Company, Ltd., Grimsby.—Registered September 18, £6,000. debs.

Catalytic Chemical Company, Ltd., Southall.—Registered September 19, £500. debs., balance of £1,500.

Cooke's (W. R.) Finishing Company, Ltd., Nottingham.—Registered September 14, £3,000. mort., to Mrs. M. E. Tomlin, White House Inn, Ilkeston Road, Nottingham, and another.

Indestructible Paint Company, Ltd., London, E.C.—Registered September 13 (by order on terms), deed of agreement and charge securing certain moneys in respect of sewer rate, to Royal Agricultural Society of England.

SATISFACTIONS.

Barnstone Cement Company, Ltd. (late Barnstone Blue Lias Lime Company, Ltd).—Satisfaction registered September 17, £1,000., part of amount outstanding July 1, 1908.

Rolls and Co., Ltd., London, N., varnish manufacturers.—Satisfaction registered September 17, £600., part of amount registered October 13, 1902.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Park Green Dye Works, Ltd.—Resolved September 11: That the company be voluntarily wound up. J. A. Snape, 5, John Dalton Street, Manchester, liquidator.

Oilfields of England, Ltd. — J. H. Beare, of Worcester House, Walbrook, E.C. 4, appointed receiver September 25.

DISSOLUTION OF PARTNERSHIP.

(*Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.*)

Brooke and Farrand (Joseph Aspinall Linton Brooke and Jas. Blackburn Farrand), Amisfield-ho., Hipperholme, chemical manufacturers and merchants. September 11. Debts by J. A. L. Brooke. (September 21.)

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Bissell, S. S. J. (trading as Woodbrook Drug Company), Back 39, Vale Place, Wolverhampton; manufacturing druggist; £13. 11s. 10d. August 17.

Premier Colour Company, 106, Leeds Street, Liverpool; paint manufacturers; £14. 5s. July 30.

Watson, H. J., Welmondin, Goldhawk Road, Hammersmith; polish manufacturer; £19. 15s. 10d. August 23.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Italy.

An old-established and experienced firm of commission agents in Trieste are desirous of securing the representation, on a commission basis, for the Trieste district of British manufacturers and shippers of edible soya bean oil and oil seeds. (Ref. No. 336.)

Poland.

An agent in Warsaw desires to secure the representation for Poland of British exporters of fertilisers. (Ref. No. 342.)

Netherlands.

An agent in Amsterdam desires to secure the sole representation, on a commission basis, for the Netherlands, of British manufacturers of tinplates. (Ref. No. 338.)

Sweden

The following inquiry has been received from the Swedish Consulate General in London, Bank Chambers, 329, High Holborn, London W.C. 1, to whom all replies should be addressed:—A firm in Sweden desires agency for English manufacturers and exporters of soya bean oil, coconut oil, chemicals used in the cellulose and paper industries, essences and vegetable essential oils.

Fuel Economy.—During September, orders have been received by Meldrums, Ltd., for 29 forced-draught furnaces, four destructors, and four gas washer-scrubbers.

REPORTS OF COMPANIES.

British Cellulose and Chemical Manufacturing Company, Ltd.

The annual general meeting was held in London on Thursday of last week, Sir Harry McGowan (chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said: Since the date of our balance-sheet, as the report states, further money has been raised. Many discussions took place as to how best we should secure additional fresh capital. In these discussions we again placed all the facts of the company's position and prospects—as we saw them—before Messrs. Dunn Fisher and Co., with the final result that the Cellulose Holdings and Investment Company, Ltd., agreed to take up a further £400,000. of debentures. While H.M. Government have no responsibility in connection with the decisions or the policy approved by your board, they duly and readily granted their consent to the increased debenture issue and the terms upon which it was arranged.

To what has that money been devoted? Well, we have completed the extension of our numerous manufacturing departments so that to-day Dr. Henry Dreyfus assures us that we can produce 4½ to 8 tons per day according to the varieties of yarn required by the trade. Our working capital remaining, composed of raw materials, goods in process and finished goods, and our liquid cash resources are meantime sufficient to face the programme of production and sales we have set out to achieve, and given a return of demand in keeping with our new capacity to produce, we shall add to our working resources according as we make profits. The decision to carry our manufacture on a sufficient scale, beyond the stage of yarn and cord, was not suddenly adopted: it has been growing upon us as inevitable during the past two years. We had sufficient machinery of this class in our works to enable us to work out the various processes as well as to assist other manufacturers to produce the materials. Moreover, in order to get quicker development, we made arrangements with a specialist in the natural-silk trade who had already produced with our material a series of bulk samples of articles which had never been produced before. The result was that over 100 fabrics varied in kind, but all of great beauty, have been produced with our Celanese, and, particularly in the finer fabrics, these cannot be made with any of the existing artificial silks. They imitate natural silk with great exactness, and in certain instances are even more beautiful than articles made with natural silk; amongst them I may name different types of crêpe de chine, crêpe marocain, crêpe georgette, pongé japonaise, all of which have been produced by the specialist at Lyons, who will be manufacturing for us in bulk there while we are proceeding with the manufacture of such articles at our own works at Spondon as our machinery comes into operation. This fine-goods trade has perhaps the widest and most promising future, and has hardly any limit, although, in saying this, please do not forget that we are not neglecting the cord and yarn trade, in which there is a steadily growing demand.

At our last meeting you were told of the dyeing difficulties we had experienced, and the point that we had then reached. Since that time much has been done, and we have arrived at a stage when our technical advisers believe they are able to produce any colour, shade or standard degree of fastness, as required. In view of this you can take it that our dyeing methods are now just as simple as those for any other fibre, such as cotton, and are not likely to prove more costly. While upon the subject of dyeing I might mention that it is a peculiar property of the new dyestuffs in conjunction with Celanese, that if Celanese is mixed with cotton or other fibres, the latter will be unaffected by the dyes, and from this you will realise that when fibres are woven or knitted containing mixtures of Celanese with other fibres in various proportions, quite unique effects can be obtained. The other fibres can either be left white or simultaneously be dyed with other dyestuffs for the same or a totally different shade. The development is in its infancy, but the field of possibilities is a wide one.

The report and accounts were unanimously adopted.

The proposed alteration of the title of the company to "British Celanese, Ltd.," was also approved.

English Oilfields, Ltd.

An interim progress report issued by the company states:—Shareholders will recollect that the last balance-sheet contained a note: "There are claims in respect of uncompleted contracts, etc., which it is estimated will not exceed £25,000." The claims referred to were in respect of a liability on the contract made by the old board for the condensing plant, and a claim for £2,775. in respect of plant, etc., taken over from the vendors under the original purchase contract. The contract for the condensing plant has been settled by the payment of £17,500., and an arbitrator in the case of the latter claim has awarded the claimants £100. The liquid funds of the company are now round about £96,000. The company's action for the recovery of unpaid instalments on shares is expected to come on for hearing in the course of the next month or so.

British Cotton-Seed Products, Ltd.

The ordinary general meeting was held in London on Tuesday. Viscount Doneraile presided, and in moving the adoption of the report and accounts, said that they had to meet the shareholders for the third time with a balance-sheet showing a loss. There had been no serious attempt during the year under review to get any substantial output from the factory. Actually only about 1,000 tons of seed had been treated.

After some discussion the report and accounts were adopted, but by a further resolution a shareholders' committee of inquiry was appointed, consisting of Professor John A. Todd, Sir Arthur Roberts and Mr. Mackenzie.

DIVIDENDS.

Bell's United Asbestos Company, Ltd. — Directors have declared an interim dividend on ordinary shares of 5d. per share, less tax, on account of the profits of the current year, payable October 22. A year ago the interim payment was the same.

Taylor's Drug Company, Ltd. — Dividend on the preference shares at the rate of 6 per cent. per annum for the past half-year.

Boots Pure Drug Company, Ltd.—Interim dividend of 9 per cent., less tax, on new ordinary shares with respect to quarter ended September 30.

NEW COMPANIES.

Alfred Fairclough, Ltd.—Private company. Capital £1,000. Fertiliser manufacturers and merchants, bone crushers and dealers, etc. Office: Daisy Works, Daisy Walk, Sheffield.

Ashwood Dale Quarries, Ltd.—Private company. Capital £10,000. Producers of lime, limestone, etc. Office: Ashwood Dale Quarries, near Buxton, Derbyshire.

Ideal Requisites (1923), Ltd.—Private company. Capital £500. Manufacturers of disinfectants, soaps, polishes, etc. Office: 22, Victoria Chambers, South Parade, Leeds.

Northern Sabulite Explosives Company, Ltd.—Private company. Capital £50,000. Office: 129, Victoria Road, Darlington.

Pynol, Ltd.—Private company. Capital £50,000. Manufacturers of and dealers in a fuel for internal-combustion engines, etc. Solicitors: Simmons and Simmons, 18, Finch Lane, London, E.C. 3.

Swalcliffe Limestone Fertiliser Company, Ltd. — Private company. Capital £5,000., in £1. shares (4,000 8 per cent. cumulative preference). Office: Swalcliffe, near Banbury.

Towles, Ltd.—Private company. Capital £150,000., £1. shares (50,000 preference). Address: 26, Warren Street, Barrow-upon-Scar, near Loughborough.

Waen Silica Company (North Wales), Ltd.—Private company. Capital £1,000. To acquire any mines, mining rights, and metalliferous land in Mold or elsewhere, etc. Solicitor: F. W. Watson, 7, Brazennose Street, Manchester.

William Boby and Co., Ltd.—Private company. Capital £15,000., £1. shares (12,000 10 per cent. cumulative preference and 3,000 ordinary). Water purification and softening engineers, etc. Office: 62 and 64, Brook Street, Hanover Square, London, W.

Ralph W. Stewart and Co., Ltd.—Private company. Capital £100,000., £10. shares. Rubber manufacturers. Office: Elgin Works, Dunfermline.

Dy-O-La Dye Company.—Capital, two kinds—viz.: With nominal or par value 375,000 dollars, in 100 dollar shares, and without nominal or par value 50,000 shares in 25,000 shares of common class A. and 25,000 shares of common class B. Incorporated in New Hampshire, U.S.A., in July, 1920. British address: 95, St. James Street, Manchester.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN AUGUST.

(Concluded from page 374.)

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of August, 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the Returns.

SOFNOL SUPER-LIME SPECIALITIES

The best grade to use

The best grade of Soda-lime to use depends on the particular application in view. Sofnol Soda-lime is graded to meet your exact requirements—each grade is the best there is for its own particular purpose.

Where extremely rapid absorption is required we suggest the use of Sofnol Soda-lime G, which contains a Manganese catalyst. With this grade the rate of Carbon dioxide absorption is approximately doubled, while there is the further advantage that the colour change during use indicates at a glance the degree of saturation of the granules. The photograph illustrates some of our grades of Soda-lime. The darker coloured granules above are Sofnol Soda-lime G, while the colour change is shown in the U-tube below.

FERTILISER NEWS.

Nitrate of Soda.—The outlook for the nitrate industry is very involved, and although the steady diminution of stocks on the West Coast of Chile is viewed with considerable satisfaction, it is essential that the curtailment of production be also taken into account. When it is remembered that output is based on approximately 60 per cent. of capacity, and that by reason of the system of selling "quotas," production costs are lower than if all the "oficinas" were working on short time, the question of increasing production is one which involves many issues. The chief obstacle to an extension of output is the difficulty of procuring suitable labour for work on the nitrate grounds. With the expansion in the Chilean copper industry, most of the available labour has been absorbed, while the difficulty is enhanced by the conditions of working. There is little doubt that the desire for improved conditions has led to the demand for a higher rate of wages which means increased costs. Further than this, it is no secret that the Chilean Government do not desire to repeat their experience of some two or three years ago when, owing to the great slump in nitrate following on the over production coupled with high prices, they were compelled to assist the nitrate industry by providing for large numbers of unemployed labourers, turned adrift as a result of the drastic curtailment of production. Thus there is little doubt that, paradoxical as it may seem, a larger output would almost certainly be followed by an increased range of prices, unless the companies decided to accept a less profit, meaning diminished dividends and falling share values. An alternative to this would be a reduction of the export tax levied by the Chilean Government, but this would almost certainly, only be resorted to in the last extremity. The action of the Government in agreeing to postpone receipt of the export tax for a certain period on shipments of nitrate has the natural effect of encouraging the shipping of material to foreign ports, where it can be warehoused and sold direct. It is safe to infer that were it not for this provision the West Coast stocks would not be diminishing at the rate they are, if at all, which means that the statistics are rather misleading. The result is that while exports from Chile have largely been exceeding those during the same period of 1913, deliveries from ports in Europe and the United States, which may be taken as indicating, to some extent, the consumption figure, are considerably less than before the war. Imports into Europe and Egypt during September were 63,500 tons, and deliveries 42,500 tons, leaving the balance of stocks at September 30 at about 165,500 tons. This quantity, added to heavy shipments now on their way to Europe, totals some 362,000 tons, which compares with 296,000 tons at same date last year, and 571,000 tons in 1913. A *Reuter* message from Antofagasta reports the destruction by fire of about 70,000 quintals of nitrate.

Sulphate of Ammonia.—Interest in this fertiliser has been aroused by the publication, by the Federation, of its official prices up to the end of November. As has been the custom hitherto, prices are being increased gradually, and the increases notified in the latest announcement are very moderate. For delivery over the present month, the September price has been raised by 2s. 6d. per ton to £14. 12s. 6d. for neutral quality in fine friable condition, free from lumps, basis 25¾ per cent. of ammonia. Delivery over November is increased by an equal amount to £14. 15s. per ton. With the evidence before them of the greater popularity of the neutral quality, the Federation state that it is expected that the bulk of the deliveries will be of that standard. There is available, however, in certain districts, a certain amount of ordinary quality, 25¼ per cent. ammonia, which will be sold at £1. 3s. per ton less than the above quoted prices. It is understood, of course, that these prices are for home agricultural purposes only, and the low price of the fertiliser when compared with other nitrogeneous products should ensure the interest and attention of farmers. With rumours of autumn reductions in prices finally disposed of, and the harvesting operations drawing to a close, it is probable that consumers will shortly be estimating their requirements for the coming season, and the demand, now only moderate, will become more brisk. In view of the Federation's success in placing contracts abroad at a figure higher than the home consumer has to pay, it is interesting to note that the penalty clause is retained in domestic contracts. It is important to note that these prices do not apply to orders for Ireland, and the above penalty clause holds good for exports to that country.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

With only thirteen furnaces in blast between Workington and Carnforth with some of those not using Cumberland coke, it is nevertheless possible to maintain the whole of the coking plants in operation. What will the position be when additional furnaces are lighted and when more of the furnaces are smelting the quality of iron in which the local coke is used? If, as is often stated, there are several years of good trade in store for the iron and steel industries, it may be taken for granted that it will require the production of at least twenty furnaces and even more to satisfy the demand for iron. Every colliery development, in the Cumberland coalfield, therefore, is of importance to the iron and steel industries. The progress that can be made at Whitehaven in increasing output will be watched then with keen interest. How hard up at the present time coke makers are for the supplies of smalls they want is shown by the fact that not a ton of nuts or small coal can be spared for shipment to Ireland. The Irish demand for this class of coal is exceedingly keen, but it cannot be even partially satisfied. Everything points, it will be seen, to a busy winter for the coal and coking trades. Best round for export to-day commands 26s. per ton. It is to be noted that though there is no increase of hematite pig-iron output in Cumberland and North Lancashire it is being marketed more readily, and it is anticipated that before long no stocks will be allowed to remain in the works yards. East Coast coke supplies are 8,200 tons a week, and the new contract prices that are being paid are lower. Cumberland coke to the smelters here is quoted at 29s. to 33s. per ton according to carbon content, and to Continental users at 33s. to 39s. per ton, f.o.b. Foreign shipments of late have decreased, but they are expected to be heavier in November and December.

SOUTH WALES NOTES.

[Specially Contributed.]

The state of the tinplate industry is very steady, though it seems as if the fixed minimum price will have to be discontinued if any large orders are to be booked. Nearly all the mills are working full time, but the order books are reported to be rather low for November and December delivery. Richard Thomas and Co., Ltd., have decided to lay down six additional tinplate mills at their Burry works, at an estimated expenditure of £50,000. It is also reported that the directors are considering the installation of mills for rolling larger sheets suitable for galvanising, etc. Two new mills are to be erected at Cilfrew works, while Baldwins, Ltd., are constructing two new mills at their Elba works, Gowerton. Gilbertson, Ltd., are erecting four new sheet mills at Pontardawe, while four new mills are to be installed at Gorseinon and one at Bryngwyn. Important orders are coming in from the Eastern markets. A fine strata of Tripoli stone has been discovered on Maesyfron Farm, Abercrave. It is of a very superior quality and will, it is said, make first-class polishing powder. If the engineers report favourably, the deposit will be mined. The market for galvanised and black sheets is maintained, and good business is being booked for forward deliveries. There is the usual activity at the coke ovens and the export business has revived, some large cargoes having been shipped during the week. Residuals are fairly easy in disposal, and with pitch values receding, the patent-fuel makers are now steadily operating. A new patent-fuel factory is to be erected at Llanelly.

The amalgamation is announced of the Grovesend Steel and Tinplate Company, Ltd., with Richard Thomas and Co., Ltd., who are the largest makers of tinplates in the world, owning 14 tinplate works with 111 mills. The amalgamation will result in a combined weekly output of 12,000 tons of steel and 7,000 tons of tinplates.

The imports to Swansea during the week included 3,149 tons of phosphate rock from Porto Tampa, 4,480 tons concentrates from Port Pirie, 557 tons copper ore from Tonnay; 3,176 tons precipitate of copper from Huelva to Port Talbot; 110cwt. white lead from Genoa, 48cwt. acetic acid from Rotterdam, 27 tons zinc ashes from New York, 21½ tons phosphorus from Montreal to Cardiff; 13 tons calcium carbide and 21 tons ferro silicon from Antwerp to Newport. Included in the exports were 500 tons sulphate of ammonia to Dunkirk from Cardiff, and 1,524 tons pitch from Cardiff to Ariles.

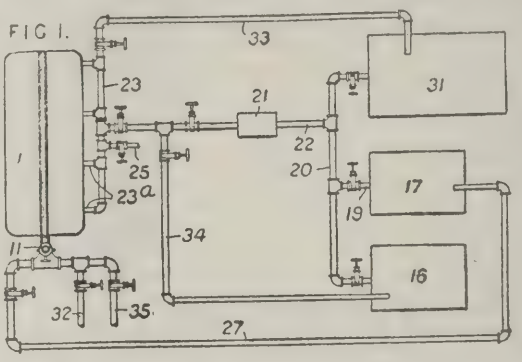
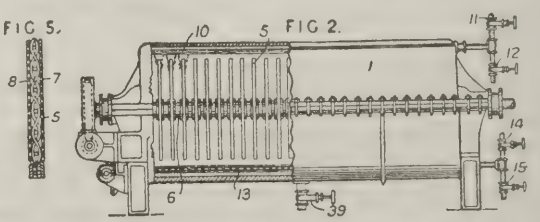
ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Coating Rotary-Filter Frames with Pulp. H. A. Vallez, Michigan, U.S.A. British Patent, **201,822**, of 1922.

In a process for coating rotary filtering-frames with a paper pulp mixture, the washed pulp is mixed with clear filtered or unfiltered liquids and is circulated through the filter under pressure until a coating of the desired thickness is obtained. After use, the coating is removed and returned to the wash tank. The pulp is boiled and soaked in a tank 16, and after draining is mixed with clear liquid in a tank 17. A pump 21 serves to force the mixture through the pipes 19, 20, 22 to a pipe 23, fitted with branches 23*a* which communicate with the filter 1. The mixture filters through the rotating frames 5, which comprise spaced screens 7, 8, Fig. 5. Pulp is deposited on the faces of the screens, and the liquid is returned by the hollow shaft 6 and pipe 27 to the tank 17. The pulp in the tank 17 may be mixed with clear water, in which case the water remaining in the frames





may be forced out by compressed air before filtration begins. The liquid to be filtered is pumped from the tank 31 through the pipes 22, 23, 23*a* into a filter, and the filtered liquid passes off through the pipe 32. To prevent caking of the deposit on the frames, a little pulp is added during the filtering process. When the filter requires cleansing, the supply from the tank 31 is cut off, and the liquid in the filter is returned through the pipe 33 to the tank 31. The filter is flushed with water from the pipe 25, and the water issues through the pipe 35. Finally the filter is half filled with water, compressed air and steam are supplied from the valves 14, 15 and a perforated pipe 13, and water and compressed air are supplied from the valves 11, 12 and the spray-pipe 10, whereby the pulp and sediment are disintegrated and held in suspension in the water. The mixture is now forced back to the tank 16 through the pipe 34, to be washed preparatory to further use. A pipe 39 is provided to withdraw water used to wash the filter.

Carbazol Condensation Products. W. L. Galbraith, W. Lewcock, and S. B. Tallantyre, London. British Patent, **201,624**, of 1922.

The condensation of carbazol with *p*-nitrosophenol or its homologues or derivatives in the presence of a condensing agent is effected by bringing the reacting bodies together at a temperature below –5° C. and maintaining the same below 0° C.; a temperature of about –20° C. is preferred and is maintained constant throughout the reaction; one component in a finely divided solid state may be added to a sulphuric acid solution of the other, or sulphuric acid solutions of the components may be mixed; the products are preferably isolated by pouring into dilute alkali. The products yield sulphide dyestuffs of greater purity than those from indophenols prepared at higher temperatures. Specification 2918/09 is referred to.

Perylene Dyestuffs. S. Sokal, London. (Kalle and Co., Akt.-Ges., Biebrich-on-Rhine, Germany.) British Patent, **201,786,** of 1922.

By treating perylene-3:4:9:10-tetracarboxylic acid, or a substitution product thereof, with ammonia or primary aromatic or aliphatic amines it is converted into difficultly soluble imides which dye animal and vegetable fibre in fast red to blue-violet shades from the vat. The perylene 3:4:9:10-tetracarboxylic acid may be prepared by oxidising with hypochlorite, chromic acid or other oxidising agent, the vat dyes made by alkali fusion of perinaphthindanone or perinaphthindandione.

Anthraquinone Acid Dyestuffs. British Dyestuffs Corporation, Ltd., London; J. Baddiley, Manchester; and W. W. Tatum, Huddersfield. British Patent. **201,610,** of 1922.

Salicylsulphonamidoanthraquinones are obtained by condensing salicylic sulphochloride ($OH:COOH:SO_2Cl$ = 1:2:4) with aminoanthraquinone compounds. The products dye wool blue shades in acid baths and may be chromed; or they may be printed on cotton with chrome mordants, or used for dyeing cellulose acetate silk. Specification 202,157 is referred to.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Formaldehyde-Urea Condensation Products. F. Pollak, Vienna. (Assignee of K. Ripper, Vienna.) British Patent, **201,906.** Convention date, August 2, 1922.

In the manufacture of condensation products from formaldehyde and urea, thiourea or their derivatives with or without a condensing agent, any acidity in the fluid intermediate product is reduced or eliminated by the addition of strong or weak bases or salts exercising a basic action before proceeding to the hardening treatment. The amount of added base is in excess of that required to fix any free formaldehyde present. Furthermore, the formation of cloudiness in the hardened material is controlled or prevented by the addition of "salt-like" electrolytes, the activity of which in this connection is stated to follow the sequence of Hofmeister's ion series.

Utilisation of Chromium Residues. Jucker and Co., Chemische Fabrik, Haltingen, Baden, Germany. British Patent, **201,942.** Convention date, August 7, 1922.

Residues containing chromium obtained in the production of organic dyes are dissolved in sulphuric acid in excess and treated with a bichromate, the acid used being sufficient to convert the total chromium into sulphate or basic sulphate. When potassium or ammonium bichromate is used, a chrome alum may be crystallised out by adding the necessary additional quantity of potassium or ammonium sulphate. The bichromate is preferably added in instalments.

Silicates of Basic Dyestuffs. W. Eberlein, Kochel, Upper Bavaria, Germany. British Patents, **201,940** and **201,941.** Convention date, August 6, 1922.

The formation of colour lakes from basic dyestuffs and colloidal silicates, such as colloidal aluminium silicates, is effected by mixing the silicate and dyestuff with a quantity of water insufficient to dissolve the dyestuff, and heating. Substances to promote sub-division of the silicates, such as alkalies or protective colloids, may also be added; higher temperatures may be employed by carrying out the reaction under pressure. The products may contain up to 80 per cent. of colouring matter. An example is given of the production of an auramine lake. Base-exchanging silicates, such as zeolite and permutite, may be employed as the substrata; it is not necessary that they should be colloidal. In an example, methylene blue is ground with a base-exchanging zeolite and the mixture boiled with a small amount of water until the dyestuff is completely fixed.

Chlorination of Rubber Latex. Naugatuck Chemical Company, Naugatuck, Connecticut, U.S.A. (Assignees of E. Hopkinson, New York, U.S.A.) British Patent, **201,898.** Convention date, August 3, 1922.

A substantially dry mixture containing distributed solid particles of rubber, gutta, etc., is subjected to the action of a halogen, or halogen acid. According to an example, 100 parts of kieselguhr is moistened with 150 parts of water to which 9 parts of ammonia have been added, 100 parts of latex containing 36 per cent. of solids are added, excess water is expressed, and the mixture is ground and dried at 200° F., and exposed to chlorine until the weight has increased by 20-24 per cent. The mixture is aerated, ground, and again exposed to chlorine. Concentrated ammonia is stirred in to remove traces of acid, and the product is washed free from ammonium chloride. The material is moulded under pressure at 225-240° F. Porous slabs may be formed by moulding the wet untreated mixture, drying at 200° F., and subsequently chlorinating.

Stannic Chloride. Buss Akt.-Ges., Basle, Switzerland. British Patent, **201,927.** Convention date, August 4, 1922.

Apparatus for the production of anhydrous stannic chloride comprises one or more reaction vessels similar to inclined jacketed retorts in which the tin ingots are closely packed so as to leave a small space around them for the chlorine. The inclination of the chambers is such as to allow stannic chloride but not molten tin (if any forms) to be run off into receptacles.

Phosphorescent Zinc Sulphide. Allchemin Allgemeine Chemische Industrie Ges., and R. Jahoda, Vienna. British Patent, **201,922.** Convention date, August 2, 1922.

Phosphorescent zinc sulphide is prepared by dissolving crude zinc or pure zinc together with crude zinc in an acid such as hydrochloric acid so as to leave excess of zinc, or treating a zinc salt solution with excess zinc, separating iron from the solution by treatment with an oxidising agent such as bromine or permanganate and a basic substance such as an alkali hydrate or carbonate or an alkaline earth, adding a very small quantity of a salt of a heavy metal such as a salt of copper, thallium, uranium, or manganese, and precipitating zinc sulphide by an alkali sulphide, sulphuretted hydrogen, ammonium sulphide, or, if the acid radicle does not form insoluble alkaline earth salts, with barium or strontium sulphide. An excess of zinc salt should be left in solution. The zinc sulphide is dried direct or after a single washing and calcined with exclusion of air, for instance in a tightly closed crucible or in an inert atmosphere or in a vacuum. The calcination may be carried to 1,000° C. To increase the luminosity the cooled product is examined in a darkened room, the least luminous portions being picked out and rejected. The remainder is levigated with hot water, a further quantity of less luminous coarse particles being thus rejected, and finally the product is filtered and dried at or above 100° C.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," October 6, 1888.)

From Charybdis to Scylla.—It cannot be gainsaid that enormous sums of public money have been spent and squandered in futile attempts to deal with the sewage question, chemical operations have been attempted on a vast scale by persons to whom even the elements of chemistry was a theme unknown, and after some good and practical scheme had been devised and put into action at great expense and under the supervision of men of undoubted ability, the cheese-paring proclivities of Alderman Skinflint or Councillor Graball have been quite enough to put the official watch out of gear, by their meddling with operations with which they were not familiar, and with reactions to which their lay mind could not be adapted. Many of our readers have, no doubt, served on deputations appointed to visit various sewage works, on behalf of the townships which they have been connected, and they have no doubt had an opportunity of observing the exact and scientific way in which some of the operations are carried on in those works, and how ingenuity and technical knowledge in the business has been rewarded. Perhaps not: but we have in our mind's eye the case of a sewage works opened with a great flourish of trumpets, specially looked after by a chemist and trained manager, and where are they to-day? The manager has been replaced by an individual whose only qualifications for the post were, that his previous occupation consisted in overlooking the carters, and that he had no prejudices, neither manipulative, social, political nor municipal.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals. — This market continues fairly steady, but business is still limited in volume, but has shown a little improvement in some directions. The crisis in Germany may have the effect of hardening prices here. **Acetic Acid,** 80% technical, £47.; 80% pure, about £49.; 98% glacial, £60. in casks, and £73. in glass demi-johns, ex wharf London; slightly easier rates are quoted for some grades, with the market rather quiet. **Acetone,** British Government specification, about £125 to £126. per ton, in drums; supplies continue to be limited, with prices quite steady. **Alum,** lump, in casks, £10. to £10. 10s. per ton; the demand from dealers offering Continental material remains slow. **Arsenic,** Cornish white powdered, on spot, £60. to £62. per ton; foreign material, about £60.; at these somewhat easier rates the market is much steadier, and is inclined to be firmer; America is inquiring but offering below these rates. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; dealers' quoted prices are kept up to this level; business slow. **Barium Chloride,** 98—100%, about £14. 10s. to £15. per ton; the lower prices mentioned last week hold good, but business remains slow. **Bleaching Powder,** 35—37%, about £10. to £10. 10s. per ton; importers' prices are steady, but inquiry remains poor. **Borax,** commercial, granulated £24. 10s., crystals £25., powdered £26., extra fine £27. per ton; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. Makers' prices, for home trade only, are unchanged at these rates; their prices for export vary according to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers continue to quote at these prices for home trade only, packages free, carriage paid to any station in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; dealers are offering some grades at competitive prices. **Cream of Tartar,** 99—100%, about 88s. per cwt., less 2½%, in one-ton lots; at this level the market keeps fairly steady, and some fair business has been booked. **Citric Acid,** B.P., crystals, about 1s. 5d. per lb., less 2½%; the spot position is very weak, with hardly any demand for the stocks on spot. **Epsom Salts,** commercial crystals, about £4. 10s. to £5. per ton, in bags; quoted rates from dealers are at these levels, but business is poor. **Formaldehyde,** 40%, about £70. per ton; this market is easier on the week, and supplies now on hand are moving off very slowly at the lower level. **Glauber's Salt,** commercial quality, about £3. 15s. to £4. per ton, in bags; dealers find business still very poor, and their prices are unchanged. **Lead Acetate,** brown, about £41.; white, about £42. per ton; imported material is available on spot, with the demand slow. **Litharge,** about £35. 10s. to £36. per ton; the demand from dealers has been slow, and prices are unaltered. **Lithopone,** 30% Continental red seal, about £22. to £22. 10s.; a very steady business continues in this product, with dealers' prices well held. **Ammonium Chloride,** grey galvanising, £30. 10s to £31. per ton; spot supplies are offering at these prices, with demand small; prices quoted are steady. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers' prices are unchanged. **Oxalic Acid,** about 6d. per lb.; this market remains dull, with the quoted price not very steady. **Carbonate of Potash,** 90—92%, £26. to £27.; 96—98%, about £29. per ton; the lower prices mentioned last week are steadily held by dealers, with business restricted. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; this market remains very dull. **Caustic Potash,** 88—92%, about £31. per ton, in drums; dealers' prices are fully maintained at about this figure, with some business on the market. **Permanganate of Potash,** commercial quality, about 9½d. per lb.; dealers' prices are steady near this figure, and a fair volume of business has been done. **Prussiate of Potash,** yellow, about 1s. per lb.; this price is quoted by dealers, but they seem to be doing but a few small orders. **Sulphate of Potash,** 90%, about £11. 10s. per ton, ex ship; the market shows no change on the week. **Mercury,** about £10. 5s. to £10. 10s. per bottle of 75—76lb.; this market has partly recovered from its recent weakness, and seems much steadier at the improved prices. **Red Lead,** imported, about £35. 10s. to £36. per ton; dealers offering steadily at these rates, with business fairly satisfactory. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white crystals, £25. to £26. per ton; spot supplies are available, and some business has been done; prices rather tend to advance, in view of the position in Germany. **Saltcake,** ground and unground, home trade, about £4. 10s. per ton; export, about £5. 5s. per ton, f.o.b.; the market is very steady at about these prices. **Acetate of Soda,** about £24. to £24. 10s. per ton; dealers are offering a few isolated lots at about these figures. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers' prices are steady at these levels, but little good business is reported. British makers' prices, for home consumers on contract, are unchanged at: 70—72%, £16. 17s. 6d.; 76—77%, £18. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers' prices, for home trade only, are unchanged, carriage paid. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers quote at this price for home users only. **Cyanide of Soda,** export, 8½d. to 9d. per lb.; British makers' prices given; home-trade price is slightly more. **Hyposulphite of Soda,** pea crystals, about £14. to £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £9. per ton, in casks; dealers' prices at these levels, with a fair business passing. **Nitrate of Soda,** 96%, about £13. 5s. per ton, f.o.r. or f.o.b.; prices quoted are level on the week, with the market quiet. **Nitrite of Soda,** about £26. 10s. per ton; this market keeps very steady, with inquiry quite good. **Prussiate of Soda,** about 6d. per lb.; dealers are offering on spot at this price, but the demand remains poor. **Sodium Sulphide,** 60—62% solid, about £14. per ton; ditto, broken, about £15. 5s. per ton, in drums; dealers offering Continental material at about these prices; 60—65% concentrated, in casks, about £14. per ton. **Sulphate of Copper,** about £25. 5s. to £25. 10s. per ton; the spot position remains quiet, with prices at about these levels. **Tin Crystals,** 1s. 4d. per lb.; there is no change on the week. **Tartaric Acid,** B.P. crystals, on spot, about 1s. 1½d. per lb., less 5%; spot material is freely offered, with hardly any demand; the position is certainly very weak. **White Lead,** imported, about £42. per ton; dealers are doing a limited business at about this price. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers report no change in their prices.

Pharmaceutical Chemicals.—In consequence of the critical position on the Continent, prices on spot are firmer this week, with many holders refusing to sell at cheap rates. Business has been moderate, and generally in small lots. **Acetanilid,** crystals and powder, 1s. 8d. to 1s. 9d. per lb.; spot holders are quoting these higher rates. **Acetyl-Salicylic Acid,** B.P., about 3s. 1d. per lb.; it is doubtful if there are any spot lots available under this figure; supplies seem short. **Benzoic Acid,** B.P., 2s. 3d. to 2s. 6d. per lb.; hardly any inquiry on the market. **Diethylbarbituric Acid,** B.P. (barbitone), 17s. per lb.; the market has been very quiet, and dealers' prices are unchanged. **Salicylic Acid,** B.P., 2s. 3d. to 2s. 6d. per lb.; prices for spot goods vary between these levels, with a fair demand about. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; this market keeps very steady, with business slow. **Amidopyrin,** about 14s. 3d. per lb.; there has been little doing here, with dealers' offers unchanged. **Ammonium Bromide,** about 7d. per lb.; this market seems a little steadier, but is still rather dull. **Benzonaphthol,** about 5s. per lb.; nominal; market remains idle. **Betanaphthol,**

resublimed, 1s. 10d. to 2s. per lb.; prices quoted are level on the week, with inquiry small. **Benzaldehyde 03,** about 3s. per lb.; dealers' prices show no change, with market dull. **Calcium Lactate,** 1s. 9d. per lb.; the market seems very steady at about this figure, with fair business passing. **Chloral Hydrate,** duty paid, about 4s. per lb.; some few spot lots are available, with no great demand. **Creosote,** B.P., about 2s. 6d. per lb.; the market keeps steady but quiet. **Creosote Carbonate,** about 8s. 6d. per lb.; no improvement in demand, and dealers' prices are unchanged. **Guaiacol Carbonate,** about 9s. 6d. per lb.; higher prices are being quoted here, but business is very quiet. **Hexamine,** about 3s. 7d. to 3s. 9d. per lb.; spot rates show a slight advance, and inquiry has been better. **Hydroquinone,** about 3s. 6d. per lb.; the market has again been dull; quoted rates are unchanged. **Methyl Salicylate,** 2s. 7½d. to 2s. 8d. per lb.; prices for spot material are much dearer, with supplies short. **Methyl Sulphonal,** about 15s. per lb.; quoted unchanged on a dull market. **Paraformaldehyde,** about 3s. 6d. per lb.; the spot position keeps fairly steady, but business is slow. **Paraldehyde,** about 1s. 5d. to 1s. 6d. per lb.; some little business has been done at about these figures. **Phenacetin,** 6s. 2d. to 6s. 3d. per lb.; dealers' prices are a shade firmer this week, with business occasional. **Phenazone,** 7s. 3d. to 7s. 6d. per lb.; this market keeps steady, but is still doing but little business. **Phenolphthalein,** 6s. 6d. to 6s. 9d. per lb.; prices appear very firm; business quiet. **Potassium Bromide,** B.P., crystals and granular, 6¼d. to 6½d. per lb.; the spot position seems inclined to harden just a little. **Potassium Permanganate,** B.P., about 9½d. per lb.; at this rate the market keeps very steady, with a fair business about. **Potassium Sulphoguaiacolate,** about 5s. 6d. per lb.; the market has shown no life during the past week. **Resorcin,** about 5s. 6d. per lb.; at this price the market is steady, but not at all active. **Salol,** about 2s. 9d. per lb.; the market has a steadier tone this week, with business improving. **Sodium Bromide,** B.P., crystals and granular, 7½d. to 8d. per lb.; dealers' prices are firming up a little on account of the uncertain position on the Continent. **Sodium Salicylate,** powder, about 2s. 5d. to 2s. 6d.; crystals, 2s. 7d. to 2s. 8d. per lb.; dealers holding spot stocks are holding at these prices, with inquiry fairly good. **Sulphonal,** about 14s. 6d. per lb.; no inquiry about; quoted rates unchanged. **Terpin Hydrate,** about 1s. 9d. per lb.; the market keeps steady at this level, with occasional business being done. **Thymol,** about 15s. per lb.; some spot stocks are available at about this figure.

Coal-tar Products, Intermediates, Etc.—Pitch has recovered a little, and has been in better demand. Other products show little or no change on the week, with business generally slow and small. **Aniline Oil,** about 9d. to 9¼d. per lb., drums free; the market is as last reported. **Aniline Salt,** 9¼d. to 10d. per lb., casks free; inquiry is very limited, with quoted rates unchanged. **Betanaphthol,** about 1s. 1d. to 1s. 2d. per lb.; dealers are doing little here, and prices are unaltered. **Benzol,** about 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; makers have not reduced their prices, and the market remains decidedly slow. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; quoted rates are steady, with the market dull. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; prices are level on the week, with the market quiet. **Naphtha,** about 1s. 4d. per gallon; this market remains very flat, and prices are far from firm. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; the recent lower price is maintained on a dull market. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; no further reduction is likely yet awhile, although there is little doing. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; the market shows no change. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; the market remains quiet, with rates quoted unaltered. **Creosote Oil,** about 9½d. per gallon, f.o.b.; dealers' prices are steady, with demand rather limited. **Carbolic Acid,** crystals, about 1s. 2d. per lb., f.o.b.; at this rate the market stands firm, with business restricted. **Naphthalene,** about £19. 10s. to £20. per ton; inquiry has been small; the market is steady; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; candles, £28.; tablets, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; quoted prices are level on the week, with the market dull. **Pyridine,** about 21s. per gallon; the higher price quoted last week is fully maintained, with supplies restricted. **Hexamethylene,** about 3s. 6d. per gallon; the market is a little steadier at last week's easier rates. **Pure Methyl Alcohol,** about £90. per ton, ex wharf London; this item is now very steady, and a fair inquiry has been dealt with. **Pitch,** about 130s. per ton.

ITALIAN CHEMICAL MARKET. Genoa, Sept. 29, 1923.

Quotations during the month were as follows, prices being per 100kilos. at Milan, unless otherwise stated:—**Caustic Soda,** 70—72%, Italian, 180 lire; American, 76—78%, 200 lire; English, 185 lire; French, 175 lire. **Carbonate of Soda,** 98—100%, Italian 86 lire (Genoa); English, 86 lire (Genoa); American, 87 lire (Genoa); demand very good. **Soda Crystals** fell from 50 to 40 lire, owing to absence of demand. **Alum,** crystals, 87 lire; in very fair request. **Bicarbonate of Soda,** powder, kegs, 180 lire (Genoa). **Bichromate of Soda,** 445 lire (Genoa). **Bichromate of Potash,** crystals, 590 lire. **Borax Crystals,** 99%, in kegs, steady at 400 lire. **Carbonate of Ammonia,** lump, 430 lire, powder, 370 lire; in little request. **Carbonate of Magnesia,** pure, 430 lire; in fair demand. **Chlorate of Potash,** crystals, in good demand at 310 lire. **Acetone,** pure, 98—99%, 1,250 lire. **Glacial Acetic Acid,** 99%, in fair request at 1,200 lire. **Boric Acid,** crystals, in fair demand at 800 lire. **Lactic Acid,** 80%, in little demand at 300 lire. **Bisulphite of Soda,** crystals, remained at 350 lire. **Formaldehyde,** 40%, fell from 880 to 725 lire; in short demand. **Phosphate of Soda,** 160 lire; a little better called for. **Hyposulphite of Soda,** crystals, 130 lire; very fair demand. **Metabisulphite of Potash,** steady at 400 lire. **Nitrite of Soda,** 96—98%, rose from 290 to 295 lire; better demand. **Permanganate of Potash,** crystals, in better demand at 800 lire. **Sulphate of Alumina,** crystals, 18%, remained at 100 lire; not much business. **Sulphate of Zinc,** in little request at 180 lire. **Citric Acid,** crystals, in fair demand at 1,900 lire. **Sulphate of Iron,** slow at 50 lire. **Hydrofluoric Acid,** 50%, in fair request at 600 lire. **Oxalic Acid,** crystals, moderate trade at 610 lire. **Tartaric Acid,** crystals, in good request at 1,350 lire. **Chloride of Ammonia,** lump, 98—100%, in fair demand at 600 lire (Milan); powder, 95—96%, in good call at 280 lire (Genoa). **Chloride of Calcium,** 75—80%, in good call at 70 lire. **Bleaching Powder,** in good demand; French, 110—115%, 90 lire; electrolytic, 100 lire. **Cream of Tartar,** 98—99%, powder, well treated at 930 lire. **Yellow Prussiate of Potash,** crystals, in little demand at 2,000 lire. **Yellow Prussiate of Soda,** crystals, 1,400 lire; little treated. **Silicate of Soda,** crystals, 85 lire; fairly well handled. **Silicate of Soda,** Italian, 38—45%, 65 lire; English, 140° Tw., 100 lire. **Sulphate of Soda,** crystals, 43 lire; powder remained at 65 lire. **Sulphate of Magnesia,** crystals, 50 lire. **Chloride of Magnesia,** solid, 70 lire; a slight revival in demand. **Hydrochloric Acid,** 20—21° Bé., 25 lire. **Sulphuric Acid,** 50° Bé., 20 lire; 66° Bé., 45 lire. **Nitric Acid,** 36° Bé., 155 lire; 42° Bé., 190 lire. **Benzaldehyde,** 3,500 lire. **Tannic Acid,** 80%, 2,000 lire. **Aluminium Acetate,** little handled at 160 lire. **Lead Acetate,** brown, 560 lire; white, 570 lire. **Betanaphthol,** 2,800 lire; in little demand. **Barium Peroxide,** 1,000 lire. **Sodium Peroxide,** in fair request at 1,800 lire. **Red Prussiate of Potash,** not much doing at 3,150 lire. **Caustic Potash,** 88—92%, 380 lire. **Tartar Emetic,** powder, 1,200 lire. **Mineral Superphosphate** remained at 27 lire. **Bone Superphosphate,** in slight demand at 52 lire. **Basic Slag,** 16—18%, in little call, fell from 37 to 35 lire. **Nitrate of Soda,** 15—16%, in fair call at 142 lire. **Nitrate of Ammonia,** in fair demand at 115 lire. **Nitrate of Lime,** 12—13%, in fair request at 110 lire. **Sulphate of Ammonia,** 20—21%, quotations increased from 162 to 170 lire through stronger demand. **Sulphate of Copper,** 98—99%, Italian, 225 lire; foreign, 226 lire. **Chloride of Potash,** quiet at 75 lire. **Sulphate of Potash,** little business at 85 lire. **Calcium Cyanamide,** 15—16%, in little call at 98 lire. **Sulphur,** refined, in blocks, 53 lire (Catania, Sicily), 70 lire (Milan). **Sulphur,** sublimed, 70 lire (Catania, Sicily); 77 lire (Genoa). **Crude Tartar,** 280 lire.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £61. 7s. 6d. to £61. 10s., cash; £61. 17s. 6d. to £62., three months; electrolytic, £65. 15s. to £66. 5s. **Tin:** Standard, £200. 17s. 6d. to £201. 2s. 6d., cash; £200. to £200. 5s., three months; Straits, £204.; English, £202. **Lead,** soft foreign, £26. 7s. 6d., prompt; English, £27. 10s.; chemical sheet, 36s. 6d. per cwt. for 2-ton lots, delivered, with a rising tendency. **Spelter,** prompt, £32. 15s.; hard, £27. **Antimony,** English regulus,

99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium**, 98—99%, £115.; foreign, £100., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 5s. **Bismuth**, 10s. **Platinum**, 500s. per oz. **Wolfram**, spot, 12s. 3d. to 12s. 6d. per unit. c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

The recent small improvement in demand for heavy chemicals has been maintained, but there are no changes in values to record; prices generally continue in buyers' favour. For alkali products, quotations are unchanged at recent rates with the exception of **Ammonia Alkali 58%**, which has now been reduced to £7. 10s. per ton for odd parcels. There is not much inquiry for **Chlorates** or **Bichromates**, and quotations and quotations are unaltered. **Bleaching Powder**, dull at £11. 5s., on rails, for spot lots. Roasted **Saltcake** is firm at £4. 10s., carriage paid; and £4. 15s. to £5. f.o.b., with continued inquiry, for export. **Copper Sulphate** is quiet, and price remains nominal at £25. 15s. to £26., f.o.b. Imported American **Sulphur**, steady at £5. 5s. on rails, in bulk, with fair demand. **Phosphate** and **Commercial Hyposulphite of Soda** show no improvement, and there is little or no inquiry. **Nitrite of Soda** firmly maintained at £26. 10s., and stocks are low. Concentrated **Sodium Sulphide**, unchanged at £14. per ton, carriage paid. White powdered **Arsenic** is easy at £62., on rails cornish works, and only in small request. Yellow **Prussiates** are again lower, **Potash** at 1s. per lb., and **Soda** 5½d. per lb., both carriage paid. **Caustic Potash** is firm at recent rates, but **Carbonate** has a lower tendency, owing to accumulation of stocks. **Acetate of Soda** and **Acetic Acid** are in fair request, and prices are steady. **Acetone**, easier at £126. per ton. Miscible **Wood Naphtha**, 6s. 3d. per gallon. **Lead Salts** are moving off slowly, but prices are firm; white **Acetate** £41., brown £43.; and **Lead Nitrate**, £42., net, carriage paid. Grey and brown **Acetate of Lime** continue scarce, and values rule high. **Barium Chloride**, dull at £14. 10s. to £15. per ton, on rails makers' works. Green **Copperas** is moving off fairly well, and prices show no improvement. **Oxalic Acid**, easy at 6d. per lb. **Permanganate of Potash**, unchanged at 9d. to 9½d. per lb., according to quality.

SWANSEA MARKET REPORT. Wednesday.

Tinplates moved steadily on the basis of the fixed price of £1. 3s. 1½d. per standard box. **Galvanised Sheets**, more active at £18. 17s. 6d. per ton. **Copper**, easier at £62. 2s. 6d. per ton cash, and £62. 12s. 6d. three months. **Tin** irregular, and some business passed at fully £5. less per ton than last week; prices are £200. 12s. 6d. per ton prompt, and £200. 2s. 6d. forward. **Lead** steady at £26. 7s. 6d. per ton cash, and £26. 2s. 6d. three months for foreign soft, and for English £27. 10s. cash. **Spelter** fairly steady at £32. 12s. 6d. per ton prompt, and £32. 7s. 6d. forward. **Zinc Sheets** in fair demand at £39. 7s. 6d. per ton, on truck at makers' works. **Sulphate of Ammonia** firmer at fixed sales. **Sulphate of Copper**, dull at £26. 2s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda** steady, with prompt at £13. 5s. 6d., and forward £13. 10s. 6d. per ton. **Bone Meal** slow, with prompt Indian at £9. 2s. 6d. per ton, f.o.b. **Pitch** prices were again lower at £5. 18s. 6d. per ton. **Oxalic Acid**, in small demand at 6¼d. per lb., f.o.r. **Arsenic** in better call, with lower quotations at £62. 17s. 6d. per ton for white powdered. **Copperas**, rather quiet at £2. 2s. 6d. per ton, delivered, for 4-ton lots, London or equal. **Sulphuric Acid**, in good request at unchanged prices. **Benzol**, in good call at 1s. 4d. per gallon at works. **Turpentine** easier; American, prompt, £3. 15s. 9d. per cwt., ex ship. **Linseed Oil** firm, on small supplies; raw £2. 5s. 9d., and boiled £2. 7s. 9d. per cwt., net. **Cottonseed Oil** scarce; common edible £2. 3s. 3d., and deodorised £2. 6s. 3d., per cwt. **Coconut Oil** firm, with Ceylon at £2. 4s. 9d. per cwt. **Palm Oil** steady; Lagos, £36. 15s. 6d.; softs, £36. 17s. 6d.; mediums, £37.; and hards, £37. 12s. 6d. per ton. **Coal** prices were not so firm, with increased stocks Best Admiralty smokeless, £1. 7s. 6d.; seconds, £1. 6s. 6d.; ordinaries, £1. 5s. 6d.; Monmouthshire black vein, £1. 7s. 3d. per ton, all f.o.b. **Anthracite** less active, but prices maintained, with best large £2. 7s. 6d.; seconds, £1. 17s. 6d.; Paris and French nuts, £3. per ton, all f.o.b. **Patent Fuel**, fairly active from £1. 8s. 6d. to £1. 12s. 6d. per ton, f.o.b. **Cokes**, very little change at £2. to £2. 7s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Chemicals of the heavier class continue to meet with a steady inquiry for home-trade uses, but in the export branch shipments have been on a similar scale, though a very fair amount of tonnage is still being exported. **Bleaching Powder** has had a moderate inquiry, and is £10. 5s. to £10. 7s. 6d. per ton for the home trade, and £11. 5s. to £11. 7s. 6d. per ton for export. **Chloride of Calcium** has been rather more in demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has been in good request for use in the United Kingdom, and has had a rather free shipment for foreign ports; it is £19. to £20. per ton for 76%, carriage paid, for the home trade. **Bicarbonate of Soda** has been in very fair demand for home-trade uses, but has been quieter in the export branch; the price is £10. 10s. per ton, carriage paid, for use in the U.K. **Soda Crystals** have had a steady sale on home-trade account, and are £5. 5s. per ton for the U.K., carriage paid. **Nitrate of Soda** has again had a moderate sale for home-trade consumption; a large movement of nitrate between producers and countries outside of the U.K. is reported; the price at Liverpool is still £13. 5s. to £13. 10s. per ton. **Borax** has had a steady sale on home-trade account; commercial crystals are £25. per ton, and powdered £26.; higher grade crystals are £29., and powdered £30., superfine being £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** continues to sell somewhat freely, and is £4. 10s. to £5. per ton for home-trade use, and £5. to £6. per ton for export. **Bichromate of Soda** has been steadily called for, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has been in good demand for use in the U.K., and has had a fairly heavy shipment for overseas ports; it is £7. 10s. per ton for the U.K., and £8. per ton for export, with some variation of this price according to destination. **Hyposulphite of Soda** continues to meet with a fair inquiry, and is £10. to £11. per ton, in 2cwt. bags, for commercial, and £15. to £17. per ton for the photographic quality, in 1cwt. kegs. **Sulphide of Soda** has been in slightly freer request; solid is £14. 10s. to £15. per ton, and crystals £8. 15s. to £9. 10s. per ton. **Chlorate of Soda** has moved but slowly, and is 3d. to 3¼d. per lb. **Phosphate of Soda** has been but little inquired for, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has had a moderate sale, and is 6½d. per lb. **Yellow Prussiate of Potash** has been rather more in demand, and is 1s. 1d. per lb. **Red Prussiate** has had a fair inquiry, and is 3s. per lb. **Carbonate of Potash** has been quieter, and is £25. to £31. per ton, according to quality. **Nitrate of Potash** has been steadily called for, and is £29. to £30. per ton. **Chlorate of Potash** has had a very limited sale, and is 3½d. to 4d. per lb. **Caustic Potash** has been in very fair demand, and is £29. to £30. per ton. **Permanganate of Potash** has sold with some freedom, and is 9½d. to 9¾d. per lb. **Bichromate of Potash** has been more in request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has had a fair and steady demand; first quality is £60. per ton, and second quality £57. per ton. **Sulphate of Ammonia** continues quiet on home-trade account, and has had a small shipment to overseas ports; neutral of 25¾% is £14. 12s. 6d. per ton, and ordinary of 25¼% £13. 9s. 6d. per ton, for use in the United Kingdom. **Carbonate of Ammonia** has had a fairly free sale, and is 4d. per lb. **Muriate of Ammonia** has been rather more in request; grey is £32. per ton. **Magnesia** has been steadily called for; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been quiet; it is £12. per ton for the home trade, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** continues in fair demand; it is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been in good request; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s., and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has been quieter, and the price has shown weakness; it may be given as 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has been in rather good request, and the price has had an easier tendency; it may be given as £4. 10s. per cwt. **Boric Acid** has been in fair demand; commercial crystals are £48. per ton, and powdered £51. per ton, and £2. per ton more if in casks. **Citric Acid** has moved but

slowly, and is 1s. 6½d. to 1s. 7d. per lb. **Oxalic Acid** has been in slightly freer request, and is 6d. per lb. **White Acetate of Lead** has had a quietly steady sale, and is £42. to £42. 10s. per ton. **Sulphate of Copper** has been very quiet both for the home trade and on export account; it is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been quieter, and the price has again eased; it is £62. per ton for white powdered.

WEST OF SCOTLAND CHEMICALS. Wednesday.

The slight improvement in the demand for chemicals noted last week has continued, so far as the home market is concerned, and there has been some shading of prices in certain products. The export position is unchanged, however, and inquiry continues to be of a limited character. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, lower at £70. per ton on spot; a quiet market. **Barium Chloride,** £15. per ton; this figure is unchanged, and there is nothing of interest to record. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under these figures. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at the recently reduced figure of £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this reduced figure. **Citric Acid,** 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate,** £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar,** £4. 3s. 6d. per cwt. for 99% at Glasgow; quotation shaded, but inquiry small. **Lead Acetate,** white, £41. 10s. per ton on spot; brown, more inquiry at £42. 10s. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this lower figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** lower at 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. 2d. per lb.; this is a dull market, in spite of the further reduction of ½d. on the week. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 12s. per cwt., net; a better market, with quotation still rising. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; rather easier in tone, and inclined to be dull. **Tartaric Acid,** 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

(pt.), £41.; Sydney, (F.), 7 kgs., £182.; Sydney, 1 cs. (pt.), 5 pkgs., £123.; Valencia, 2 cs. (pt.), £28.

ETHYL CHLORIDE—
Durban, 1 cs., £6.
Vancouver, 4 cs., £102.

FERTILISERS (*otherwise undes.*)—
Channel Islands, 2 t. 15 c., £52.; Calcutta, 7 c., £9.; Odense, 1 t. 5 c., £31.

GLYCERINE—
Amsterdam, 6 c., £29.; Arequipa, 4 c., £23.; Basra, 1 c., £5.; Beira, 1 c., £5.; Bombay, 1 c., £12.; Buenos Aires, 1 c., £14.; Cape Town, 90 t. 7 c., £4,335.; Delagoa Bay, 1 c., £5.; Las Palmas, 1 c., £5.; Pt. Madryn, 1 c., £8.; Shanghai, 10 c., £45.; Tientsin, 1 c., £5.; Tocopilla, 1 c., £7.

GUANO—
Channel Isles, 1 t. 1 c., £14.

GUIGNETS GREEN—
Havre, 1 ck., £63.

HYDROCHLORIC ACID—
Bombay, 1 cs., £7.
Hong Kong, 4 cs., £7.

HYDROFLUORIC ACID—
Hong Kong, 2 cs., £8.; Melbourne, 1 cs., £7.; Sydney, 2 cs., £27.

HYDROGEN PEROXIDE—
Bangkok, 22 pkgs. (pt.), £21.; Kilindini, 2 cs., £10.; Kobe (F.), 1 crby., £8.

IODIDES (*otherwise undescribed*)—
Calcutta, 2 cs., £165.; Melbourne, 1 cs. (pt.), £10.; Shanghai, 1 cs. (pt.), £7.

IODINE—
Calcutta, 1 cs., 3 cs. (pt.), £132.; Paris (F.), 20 kgs., £1,89·.; Puerto Madryn, 1 cs. (pt.), £11.; Sydney, 1 cs., £104.; Wellington, 2 cs., £310.

IODINE (RESUBLIMED)—
Auckland, 1 cs., £53.
Dunedin, 2 cs. (pt.), £7.

IRON AMMONIUM CITRATE—
Montreal, 5 cs., £67.
Shanghai, 1 cs., £7.

KIESELGUHR—
Rotterdam (F.), 10 c., £8.

LEAD ACETATE—
Bangkok, 2 cs., £9.; Calcutta, 4 cs., £10.; Melbourne, 5 kgs., 2 cks., £34.; Madras, 20 kgs., £43.

LEAD ARSENATE—
Beira, 4 drms., £27.; Hobart, 56 pkgs., £120.; Kilindini, 6 kgs., £20.; Las Palmas, 2 kgs., £7.

LEAD HYPOSULPHITE—
Melbourne, 4 cks., £82.

LEAD SUBACETATE—
Colombo, 2 cs., £9.

LITHIUM BENZOATE—
Paris, 2 cs., £78.

LITHIUM CITRATE—
Bombay, 1 cs. (pt.), £8.

MAGNESIA—
Auckland, 26 cs., £62.; Christchurch, 10 cs., £24.; Shanghai, 2 cs., £11.; Sydney, 60 cs., £144.

MAGNESIA (CALCINED)—
Alexandria, 2 cs., £13.; Bushire, 2 cs., £8.; Jamaica, 1 cs., £6.; Mormugao, 1 cs., £8.; Santos, 2 cs., £16.; Vancouver, 1 cs., £5

MAGNESIUM CARBONATE—
Adelaide, 2 cs., £12.; Auckland, 3 cs., £7.; Bahia, 2 cs., £6.; Bushire, 8 cs., £14.; Calcutta, 1 cs., £5.; Puerto Madryn, 1 cs., £6.; Sydney, 2 cks., £11.; Wellington, 2 cs., £5.

MAGNESIUM CITRATE—
Bombay, 1 cs., £7.
Teneriffe, 2 cs., £15.

MAGNESIUM SULPHATE—
Auckland, 2 t. 18 c., £67.; Belize, 5 c., £10.; Bombay, 5 c., £6.; Durban, 2 t. 16 c., £74.; Jeddah, 5 c., £6.; Karachi, 5 c., £6.; Limon, 4 c., £5.; Matadi, 5 c., £7.; Melbourne, 10 c., £25.; Mombasa, 7 c., £9.; Porto Alegre, 7 c., £11.; Pt. Madryn, 5 c., £6.; Pt. Sudan, 2 t., £38.; Rangoon, 8 c., £22.; Toronto, 2 t. 10 c., £33.; Trinidad, 1 t., £19.; Wellington, 2 t., £47.

MANGANESE SULPHATE—
Wellington, 1 ck., £14.

MERCURIALS (*otherwise undes.*)—
Jamaica, 1 cs. (pt.), £5.

MERCURY AMMONIUM CHLORIDE—
Sydney, 1 cs. (pt.), £14.

MERCURY BICHLORIDE—
Beira, 1 cs., £25.; Brisbane, 1 cs., £6.; Sydney, 1 cs. (pt.), 2 cs., £22.

METHYL ACETATE—
Paris, 5 drms., £60.

MOLYBDIC ACID—
Adelaide, 1 cs. (pt.), £6.

NITRATE OF LIME—
Beira (F.), 1 t., £16.

NITRIC ACID—
Hankow, 4 c., £6.
Sekondi, 5 c., £8.

PARALDEHYDE—
Melbourne, 1 cs., £5.
Sydney, 3 cs., £21.

PHOSPHORIC ACID—
Barbados, 4 cks., £44.; Durban, 4 cs., £8.; Melbourne, 8 cs., £25.

PHOSPHORUS—
Melbourne, 2 cs., £20.

PICRIC ACID—
Kilindini, 2 cs., £5.

POTASH (*otherwise undescribed*)
Adelaide (F.), 5 c., £8.

POTASSIUM ACETATE—
Calcutta, 2 cs., £5.
Shanghai, 2 cs., £5.

POTASSIUM BICHROMATE—
Colombo, 1 brl., £16.

POTASSIUM BISULPHITE—
Adelaide, 1 kg., £5.

POTASSIUM BROMIDE—
Adelaide, 2 cs. (pt.), £8.; Bangkok (F.), 7 cs. (pt.), £7.; Calcutta, 1 cs., £5.; Paris, 5 cks., £37.; Perth, 5 pkgs. (pt.), £6.

POTASSIUM CARBONATE—
Hong Kong, 5 cs., £18.

POTASSIUM CHLORATE—
Auckland (F.), 3 kgs., £9.

POTASSIUM CITRATE—
Adelaide, 1 cs., £13.; Bombay, 1 cs., £15.; Calcutta, 1 cs., £13.; Christchurch, 1 cs. (pt.), £6.; Dunedin, 1 cs., £7.; Melbourne, 2 cs., £23.; Perth, 5 pkgs. (pt.), £14.; Sydney, 2 cs., £27.; Wellington, 2 cs., £27.

POTASSIUM CYANIDE—
Aden, 1 cs., £10.
Auckland, 1 cs. £8.
Madras, 1 cs., £28.

POTASSIUM CYANIDE—
Singapore, 3 cs. (pt.), £17.
Wellington, 1 cs., £7.

POTASSIUM FERROCYANIDE—
Bangkok, 2 kgs., £19.

POTASSIUM IODIDE—
Accra, 1 cs., £8.; Alexandria, 1 cs., £86.; Auckland, 1 cs., £88.; Bangkok, 1 cs., £104.; Bombay, 1 cs., £90.; Calcutta, 2 cs., £175.; Christchurch, 1 cs. (pt.), £22.; Dunedin, 3 cs. (pt.), £33.; East London, 5 cs., £372.; Melbourne, 1 cs., £90.; Mombasa, 1 cs. (pt.), £9.; Perth, 6 pkgs. (pt.), £32.; Puerto Madryn, 1 ck., £10.; Pt. Swettenham, 1 cs., £53.; Santos, 1 cs. (pt.), £40.; Sekondi, 8 cs., £10.; Shanghai, 1 cs., £88.; Sydney, 3 cs., £348.; Wellington, 5 cs., £428.

POTASSIUM METABISULPHITE
Adelaide, 5 cs., £18.; Boulogne, 8 kgs., £34.; Melbourne, 8 cs., £96.; Sydney, 3 cs., £9.

POTASSIUM PERMANGANATE—
Bangkok (F.), 7 cs. (pt.), £7.

POTASSIUM PRUSSIATE—
Antwerp, 5 cks., £110.; Brisbane, 1 kg., £8.; Madras, 4 cs., £28.; Montreal, 2 cs., £25.; Paris, 10 kgs., £127.

POTASSIUM SALTS (*otherwise undescribed*)—
Jamaica, 1 cs. (pt.), £13.

PYROGALLIC ACID—
Madras, 3 cs., £35.

ROCHELLE SALTS—
Canton, 2 c., £11.; Hong Kong, 2 c., £14.; Sydney, 4 c., £10.

SALAMMONIAC—
Abadan, 2 kgs., £6.; Cape Town, 1 ck., £6.; Madras, 5 cks., £14.; Melbourne, 10 cks., £20.; Shanghai, 2 c., £8.; Singapore, 5 cs., £12.

SALICYLATES (*otherwise undes.*)—
Buenos Aires, 1 cs. (pt.), £10.; Montreal, 2 cs. (pt.), £13.; Sydney, 6 cs., £112.

SALICYLIC ACID—
Hong Kong, 1 cs., £12.

SALTPETRE—
Amsterdam, 2 t., £84.; Beira, 10 c., £12.; Cape Town, 10 c., £21.; Dunedin, 1 t., £42.; Durban, 2 t. 1 c., £41.; Durban, 1 t. 2 c. (F.), £42.; Melbourne, 2 t., £83.; Perth, 2 c., £8.; Rio de Janeiro, 2 t. 9 c., £98.; Santos, 2 t. 9 c., £98.; Seychelles, 13 c., £30.; Sydney, 3½ t., £137.

SHEEP DIP—
Antwerp, 6 cs., £18.; Buenos Aires, 52 t. 7 c., £2,590.; Bluff, 2 t. 15 c., £185.; Comodoro Rivadavia, 6 t. 19 c., £174.; Durban, 6 t. 1 c., £435.; Hastings 11 t. 13 c., £720.; Launceston, 1 t. 6 c., £45.; Oamaru, 9 t. 13 c., £608.; Rio Gallegos, 4 t. 13 c., £116.; San Julian (Arg. Rep.), 9 t. 5 c., £232.; Santa Cruz (Arg. Rep.), 6 t. 19 c., £174.; Timaru, 15 t. 15 c., £935.; Wellington, 20 t. 4 c., £1,255.

SILVER NITRATE—
Hong Kong, 1 cs., £97.; Santos, 1 ck. (pt.), £6.; Singapore, 7 pkgs. (pt.), £6.; Shanghai, 1 cs. (pt.), £14.; Wellington, 1 cs., £24.

SODIUM BENZOATE—
Madras, 9 c., £117.
Paris, 10 c., £125.

SODIUM BICARBONATE—
Calcutta, 8 c., £21.; Canton, 10 c., £8.; Delagoa Bay, 4 c., £6.; Durban, 18 c., £33.; Fremantle, 10 c., £13.; Montreal, 2 c., £8.; Pt. Elizabeth, 4 c., £6.; St. Helena, 10 c., £11.; Shanghai, 7 c., £13.; Singapore, 3 c., £8.; Trinidad, 5 c., £10.

SODIUM BICHROMATE—
Hong Kong, 11 c., £23.

SODIUM BISULPHITE—
Penang, 1 t. 17 c., £65.

SODIUM BROMIDE—
Adelaide, 2 c., £10.
Dunedin, 1 cs., £9.

SODIUM CARBONATE—
Madras, 2 c., £10.; Pt. Sudan, 2 c., £5.; Singapore, 18 cs. (pt.), £13.

SODIUM CITRATE—
Hobart, 1 c., £15.

SODIUM IODIDE—
Copenhagen, 1 cs., £98.

SODIUM NITRATE—
Townsville (transit) (F.), 10 c., £15.

SODIUM PERBORATE—
Karachi, 1 c., £7.
Sydney, 5 c., £24.

SODIUM PYROPHOSPHATE—
Sydney, 10 c., £23.

SODIUM SALICYLATE—
Dunedin, 1 cs., £7.

SODIUM SALTS (*otherwise undes.*)
Calcutta, 5 c., £22.

SODIUM SULPHATE—
Calcutta, 10 c., £6.; Irish Free State, 4 c., £13.; Singapore, 5 c., £9.; Sydney, 10 c., £10.

SODIUM SULPHIDE—
Bluff, 26 t. 5 c., £420.; Dunedin, 2 t. 12 c., £42.; Lyttleton, 29 t., £465.

SODIUM SULPHITE—
Melbourne, 1 t., £26.; Singapore, 18 cs. (pt.), £16.; Sydney, 1 t., £26.

SODIUM SULPHOCARBOLATE—
Calcutta, 1 cs., 1 c., £11.

SODIUM TARTRATE—
Calcutta, 1 c., 1 cs., £10.
Hobart, 1 c., £6.

SPENT OXIDE—
Amsterdam, 934 t. 5 c., £2,378.
Rouen, 200 t. 9 c., £635.

SULPHUR—
Melbourne, 2 c., £7.; Petrograd (F.), 25 t., £225.; Seychelles, 2 c., £7.; Shanghai, 2 c., £8.

SULPHURIC ACID—
Accra, 3 c., £9.; Beira, 2 t., £37.; Bombay, 1 c., £5.; Channel Isles, 1 t., £41.; Colombo, 3 c., £13.; Kilindini, 16 c., £35.; Pt. Sudan, 3 t., £47.; Rotterdam, 2 t., £50.; Sekondi, 1 t., £20.; Singapore, 3 t. 3 c., £97.; Valparaiso, 1 t., £107.

SUPERPHOSPHATE—
Beira, 2 t., £12.; Durban, 290 t. 11 c., £2,161.; Las Palmas, 5 t., £35.

TANNIC ACID—
Calcutta, 1 cs., £9.

TARTARIC ACID—
Adelaide, 3 t. 15 c., £397.; Auckland, 7 c., £37.; Bluff, 7 c., £43.; Bombay, 1 c. (F.), £7.; Calcutta, 1 c., £9.; Cape Town, 1 t. 17 c. (F.), £319.; Concepcion, 5 c., £41.; Durban, 2 c. (F.), £15.; Durban, 3 c., £11.; East London, 1 c., £8.; Fremantle, 5 c., £31.; Gothenburg, 4 c., £24.; Hong Kong, 10 c., £82.; Irish Free State, 5 c., £33.; Madras, 10 c. (F.), £61.; Mauritius, 2 c., £16.; Melbourne, 10 t. 10 c., £1,281.; Mornnigao, 1 cs., £5.; Newcastle, 1 c., £8.; Pisco, 1 c., £10.; Pt. Alma, 10 c., £61.; Pt. Elizabeth, 2 c. (F.), £18.; Reval, 10 c. SODIUM CARBONATE—
Montreal, 10 cs.

SODIUM SULPHITE—
Copenhagen, 10 kgs.

WHITE LEAD—
Antwerp, 560 ktls., 4 kgs.; Copenhagen, 30 cks.; Hamburg, 2 cks., 80 kgs.; Montreal, 160 kgs.

ZINC OXIDE—
Copenhagen, 21 cks.

N. & S. SHIELDS.

Week ending September 29.

ANTIMONY—
Callao, 9 c. 3 qrs.

CALCIUM CARBIDE—
Valparaiso, 1 t. 15 c. 1 qr.

SODIUM HYPOSULPHITE—
Arica, 3 t.

WHITE LEAD—
Talcahuano, 1 t. 19 c. 1 qr.

PRICES CURRENT.

WEDNESDAY, OCT. 3, 1923.

Prepared by Messrs. Higginbottom & Co., 21, Spring Gardens, Manchester.

The values stated are f.o.r. at makers' works, but it must be understood that the prices in different localities may vary.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers)	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

PURE CHEMISTRY AT THE EMPIRE EXHIBITION.

THE decision to organise a comprehensive exhibit dealing with pure chemical science at the forthcoming British Empire Exhibition is one on which the Association of British Chemical Manufacturers, the Royal Society, the Society of Chemical Industry, and the other scientific and technical bodies collaborating, have every reason to feel satisfied. The main outlines of the proposed exhibit and the reasons that have prompted the A.B.C.M. enthusiastically to support it were given by Mr. Woolcock on Monday at his conference with the editors of the various chemical trade and technical journals. The matter was also dealt with in detail by Dr. Levinstein in his address to the inaugural meeting of the session of the Manchester Section of the Society of Chemical Industry on Friday last. Dr. Levinstein is the chairman of the representative committee that has been formed to organise the scientific exhibit, and, as was pointed out by Dr. E. F. Armstrong, has devoted much time and energy to the project. At first thought it might appear anomalous that the A.B.C.M., a body the interests of which are of course commercial and which has already sole charge of the organisation of the industrial chemical exhibit, should contribute both money and effort to the purely academic exhibit. Yet when the ultimate objects and purposes of the Empire Exhibition are considered, it is seen that this latter section possesses an importance scarcely secondary to the industrial exhibit. As Dr. Levinstein pointed out, the purposes of the Chemical Sections of the Exhibition are to demonstrate the strength, efficiency, enterprise, and range of all branches of British chemical industry, and thus by enhancing this country's prestige in all parts of the world to create in the minds of overseas buyers a new and eminently favourable atmosphere with regard to the British fine-chemicals industry. It is now becoming fully realised that industries dependent upon research cannot be made to flourish by Government legislation, but can only prosper permanently in a country where chemical teaching and pure scientific research are adequate not only in quality, but also in quantity. The pure chemistry exhibit will impress upon overseas visitors the great amount of scientific work of the first order that British investigators have done for the benefit of mankind as a whole, and convince them that the present efforts to

establish a vigorous fine-chemical industry here are not sporadic, but are founded upon a basis of scientific achievement and reserves which assures eventual success. Incidentally, by assembling the results of British scientific accomplishment during the last forty years within comparatively small spatial compass, the exhibit should destroy once and for all the legend that we in this country are behind the Germans in any branch of chemical science. The scientific exhibit is to be divided into sections dealing with the following branches: Alkaloids, sugars, terpenes, natural colouring matters, coal-tar dyestuffs, agricultural chemistry, biochemistry, physical chemistry, inorganic chemistry, and general. Each section is in charge of our foremost specialist or specialists; Principal Irvine, for example, is organising the sugar exhibit, Sir J. J. Russell the agricultural chemistry exhibit, and Professor Gowland Hopkins the biochemistry exhibit.

SIR WILLIAM POPE AND THE B.D.C.

On another page we reproduce the letter written to the *Morning Post* this week by Sir William J. Pope, in which he criticises very adversely the constitution of the present directorate of the British Dyestuffs Corporation. Sir William's is only one more voice added to the growing chorus of informed opinion, but his reputation as a chemist and dyestuffs expert is so great that the chairman of the Corporation has thought it advisable at last to attempt an open reply. In this reply Sir William Alexander ignores entirely the main question raised by the Cambridge professor—namely, that of the necessity of incorporating technical experts in the directorate,—and has confined himself, in substance, to the assertion that all is yet well with the affairs of his organisation. Professor Green has resigned, it is true, but his successor has already been appointed in the person of Dr. W. H. Perkin, the well-known Oxford chemist and director for some years of the research work carried out at Oxford University on behalf of the Corporation. No one will disagree with the exceptional qualifications of Professor Perkin and his eminent suitability as the successor of Professor Green; but what guarantee is there that the new director of research will not in time find his position untenable and be compelled to adopt a similar attitude to his predecessor? Until the principle of technical representation on the Board is accepted, we are convinced that internal stability will never be reached in the Corporation. A statement by the present directors to the effect that they accept this principle and are prepared in the near future to recommend for election to the Board one or more technical men either from the ranks of their own employees or from outside their organisation, would be reassuring; but it must be admitted that the evidence yet available indicates that the directors do not accept this principle, at least so far as its immediate application is concerned. Sir William Pope's contentions are sound and put in perfectly definite language. There is one point, however, on which we think he has been rather unfair, and that is where he implies that the technical Press have emphasised unduly the question of the policy of the Board. For our own part, we have pointed out repeatedly the absolute necessity for technical representation on the Board as a matter entirely independent of the policy pursued by that Board. We still remain firm in our opinion, which we developed fully in these columns three weeks ago, that the expressed policy of the present directors is fundamentally sound; but any implication that we have confused the issues or not given our unqualified support to the principle of technical men managing technical enterprises would be quite unmerited.

A MADAGASCAN MYSTERY.

A recent issue of the *Board of Trade Journal* contains the isolated announcement that from now onwards anthraquinone may be imported into Madagascar duty-free. The most probable explanation of this remarkable notification no doubt is that the substance was inadvertently omitted from some former classification of the Madagascan Customs tariff by the French authorities and the present announcement is a belated amendment. We have not, however, been able to verify this supposition yet, so that the other possibilities must not be lost sight of. Can it be that this welcoming of imported anthraquinone on the part of the Malagasy shows that they also have realised the necessity of establishing a fine chemical industry and have determined to run no risks in the case of future hostilities by making a start with the manufacture of alizarin and allied dyestuffs? Are we to meet yet another competitor in the dyestuffs markets of the world? We confess we cannot answer these sinister questions, nor yet the further one of whether new uses for anthraquinone as distinct from its application as a dyestuff intermediate or as a catalyst in certain analytical operations have been discovered by the scientists of Madagascar. Perhaps some of our readers can enlighten us.

THE LATE DR. HARKER.

The death of Dr. John Allen Harker on Wednesday at the early age of fifty-three removes one of our most eminent practical exponents of chemical and physical science. Prior to the war Dr. Harker was best known by his work as head of the Thermometry Division of the National Physical Laboratory at Teddington. He was also a member of the Councils of the Physical Society of London and of the Faraday Society and a member of the committee of the British Association on Gas Engines. During the war he was responsible for the organisation of the work of the Nitrogen Products Committee of the Ministry of Munitions, and was director of the Research Laboratories set up to study modern nitrogen fixation processes. In recent years Dr. Harker has been a prominent member of the Oxygen and Gas Cylinders Committees of the Department of Scientific and Industrial Research. His masterly address on "Post-War Progress in the Fixation of Nitrogen" to the meeting of the British Association at Hull last year will long be remembered.

ELECTRICAL POWER FOR CHEMICAL PLANTS.

WHEN TO BUY AND WHEN TO GENERATE.

By Hartland Seymour.

At some time or other every chemical plant must make a decision whether the power necessary for the various operations is to be purchased from a central station or generated in the works. It is quite impossible to make any kind of general classification of plants which should or should not purchase power, because so many factors of varying weight enter into the problem.

The power requirements naturally depend upon the type of product turned out. In some cases a continuous and heavy supply of energy is essential; in others, the power necessary is slight and the supply intermittent. Again, the works may be very favourably situated for purchasing power, or they may be in a district where a central supply is not handy. In other cases the best arrangement is to buy part of the power and generate the remainder. In any case independence in the matter of power supply is desirable on account of breakdowns, and the manager or whoever is responsible for such a decision must make up his mind just how much this independence is worth to him.

Electrical Energy in Conjunction with Steam Power.

In some cases operations have been laid out with the view of utilising not only purchased electric energy, but also steam power generated at the plant. This arrangement does not take advantage of the lower power increment of either system, and cannot be recommended for general installation except in cases where the life of the operation is short. The power costs at such an installation will always be higher than could be obtained by generating all the power in an economical power plant, or by purchasing all the current necessary from a central station.

The source of power chosen should not affect the output of a chemical works provided that the available sources of supply are reliable. As a general rule, however, production costs do not depend on the source of energy, but the difference is not directly proportional to the costs of power delivered from the various sources, because with certain of these special equipment is made essential, and the fixed charges on these investments modify the cost that must be borne. Further, direct and indirect costs result inevitably from the interruptions which arise when certain central sources of supply are employed. Alternating current should be used for distributing power from the delivery point to the converter sub-stations at load centres, except where the power requirements on any particular operation are small. Whether the power is derived from a central station or from a generating station in the works does not affect the design of the system by which the energy is distributed. The one possible exception to this rule is where a small existing plant has a direct-current generating station. In such installations some advantage might be gained in the distribution system by an arrangement of converter sub-stations made possible by the purchase of energy.

Continuity and Uniformity of Public Electricity Supply.

It is not always a good policy to place a new chemical works where the owners cannot control the power supply. This is especially true if there is any doubt as to the reliability of the power supply, for it is obviously foolish to consider for a moment making the successful operation of the works dependent solely on a power supply that is liable to frequent interruptions of uncertain duration. Opinions differ on the degree of continuity of service to be expected with reason from a public supply. What we do know, however, is that it is possible to design and build power units for chemical plants which are reliable and in which interruptions are rare. In this case the owners of the works have a right to expect the same service from a public utility company. The only interruptions to continuous supply which the works should have to accept without murmur are those due to an "Act of God"—heavy storms, lightning, and the like.

Again, the power supply must possess some degree of uniformity. Frequencies, voltages, and pressures which vary from hour to hour are not conducive to satisfactory and efficient operation. In a properly designed plant uniformity of supply is one of the first considerations. If efficient service were demanded from the utility company by all those using the station or contemplating the purchase of power, there is no doubt that such a service would be forthcoming. The effect of this demand would be to force the utility company to restrict its load to its capacity, instead of straining after every prospective customer, with the promise that the plant would be developed so as to ensure uniformity of supply.

Effects of Interruptions or Variations in the Supply.

Generally, the operations in a chemical works are scheduled, and any irregularity in the power supply, even of only a few minutes' duration, serves to destroy this schedule and confuse any sequence of operations. In addition, the resumption of the energy supply more often than not leads to secondary disturbances arising when sets of machinery are put simultaneously into operation. Any interruption in the flow of energy reduces automatically the output of the works, but it does not, at the same time, suspend the payment of wages or lower the cost of raw materials. The result is an unproductive expense that sends up the cost of the finished material. A shut-down may not only reduce or wipe out any margin of product, but it may actually ruin the product. Power sources that cannot be relied upon result in an undependable production. This handicaps the works in obtaining contracts on a time-delivery basis, or if a time-delivery guarantee is given and subsequently broken, the reputation of the manufacturer suffers.

It may even be desirable to have the plant provided with a loop system of transmission so that energy may be derived from more than one source. Though line trouble must be expected in almost any system, it is unlikely that the same trouble will develop in two systems.

If a plentiful water supply for power-plant operation cannot be obtained in the vicinity, it is impossible to instal an isolated generating station. In this case it is just as unreasonable to equip a works with a generating plant which must depend on a distant source for its water, as it is to expect a continuity of power supply from an unreliable utility company.

The financial condition of the chemical works may not permit the erection of a private generating station; the investment necessary will vary between 20 and 40 per cent. (depending on the nature of the works) of the capital expenditure. In many cases this additional capital will not be forthcoming, when the only alternative is purchased power.

Costs Chargeable to Central-station Power.

Equipment at the works employing purchased power is usually simple. This consists of a transformer sub-station and the connection to the distributing buses. The purchase of power makes necessary some auxiliary equipment that would not be embodied in the plant design if the power were generated on the works. In any comparative cost schedule the investment, fixed, operating, and maintenance charges for such equipment should be included as a charge against central-station power. In any such comparison the costs chargeable to central-station power will cover:—

1. Cost of power delivery, reckoned on the basis of the established rates of the company.
2. Interest on investment required for lines, sub-station, and any other equipment essential to the power delivery.
3. Maintenance and fixed charges on lines, sub-station, and other equipment up to the point of delivery.
4. Labour chargeable up to the point of delivery.
5. Interest on investment for auxiliary equipment made essential by the purchase of power.
6. Maintenance and fixed charges on equipment as in (5).
7. Labour chargeable on equipment as in (5).

Central-station plants supplying energy to numerous works have a varied load, resulting in an annual load factor of very seldom less than 40 per cent. The annual oad factor of a single industrial plant may vary between 10 and 25 per cent. In this connection it should be remembered that the larger capacity and better load factor give the central station an advantage that neutralises any benefit enjoyed by the individual plant resulting from cheap water or low transport rates on coal.

Cost of Operating a Private Station.

Again, the individual plant cannot hope to generate power at a cost which is comparable to that achieved by the central plant. It is worth remarking here that considerable economy can be effected by the individual plant if low-grade or refuse fuels are burnt, especially refuse or waste from the works itself. There is also the realm of waste heat—but this is digression.

In calculating the cost of operating a private generating station, a very thorough study of the operating conditions is essential. The costs for the individual plant should be divided up under the following heads:—

(1.) Operation.—(*a*) Fuel. (*b*) Water, including cost of treatment and labour. (*c*) Engine-room labour, boiler-house labour, coal- and ash-handling labour, electrical labour. (*d*) Engine and boiler-room supplies.

(2.) Maintenance Costs.—Charges for engine-room, boiler-house, coal- and ash-handling, electrical equipment.

(3.) Fixed Charges.—Investment cost, amortisation cost, administration cost, insurance and taxes.

It must be realised that the manufacture of chemicals and the generation of power are two very separate and very distinct jobs. It is essential, therefore, that skilled men be put in control of the generating plant and the transmission system.

A Final Considered Opinion.

I have often been asked this question: To what extent may the cost of purchased power exceed the calculated cost of private generation to make it still worth while to buy power? I believe that though the annual cost of purchased power exceeds by 10 per cent. the estimated cost of generated power, it is still advisable to buy power. In other words, the value to the works of eliminating the necessity of building, equipping, and operating a private plant can be capitalised at 10 per cent. of the calculated power cost.

CADMIUM IN SOLDERING ALLOYS.

RECENT AUSTRALIAN RESEARCH.

OWING to the scarcity of metallic tin a considerable amount of research work was done during the war period by both the Central Powers and the United States in the substitution of tin by cadmium in alloys for soldering. Attention has again been drawn to this question as a consequence of the development of the electrolytic method of recovering zinc from its ores, which method requires the elimination of the associated metals in order to produce the extremely pure electrolyte necessary for the successful working of the electrolytic process. Apart from copper, which enjoys of course a well-established and wide market, the principal metal removed from the solutions is cadmium, which hitherto has been ranked amongst the semi-rare commercial metals.

Cheap, Pure Cadmium a By-Product of Electrolytic Zinc.

Cadmium metal was originally made commercially by fractional distillation of the first produced blue powder in the Silesian zinc works, and its recovery from baghouse fume and residues from lithopone plants has been taken up both in Germany and the United States. In both cases the method involved in its production is intricate and relatively costly. The electrolytic process, however, enables cadmium metal to be marketed at a price which brings its use as an alloy in solders within the range of commercial politics. The potential capacity of the world's large-scale electrolytic zinc refiners and the amount of raw material at their disposal, are such as to ensure adequate supplies of cadmium for the uses yet discovered or adumbrated by research.

The British Empire has been placed in an independent position as regards cadmium by the establishment of the Electrolytic Zinc Company's refinery at Risdon, Tasmania. The Research Department of this company has been reviewing the work done in America and the Continent, and conducting original research on the general subject of the uses of cadmium, and has just issued the following report* on the special subject of cadmium solders.

Details of Manufacture of Cadmium Solders.

Solders containing cadmium have been made and tested exhaustively by the Engineering, Electrical, and the Research Departments at Risdon, Tasmania. The solders have the following composition:—

	Per cent.		Per cent.		Per cent.
No. 1	Pb—90 Cd—10	No. 2	Pb—80 Cd—10 Sn—10	No. 3	Pb—90.8 Cd— 7.8 Zn— 1.4

Various samples of these alloys were prepared and the best method of preparation, which is practically parallel to the preparation of ordinary tin-lead solder is as follows:—The lead is melted first and when completely liquefied a little flux resin is added, the metal thoroughly stirred, and any dross formed during the stirring removed. In the case of Nos. 2 and 3 the tin and zinc respectively are then added and thoroughly stirred in. On addition of the cadmium the combined metals are stirred for about 1 hour, with occasional additions of flux when necessary. This period for stirring has been found essential in order to mix thoroughly the metals, but it may be shortened if the cadmium is mixed in small pieces and the whole stirred vigorously during the mixing and melting phase. In the preparation of each of the above solders there does not appear to be any tendency to segregation after the metals have been thoroughly mixed. Also with a cover of resin there is no excessive oxidation of the cadmium or tin in the solder at temperatures up to 450° C. Without a flux, oxidation is rapid at temperatures over 400° C., and in one test over 50 per cent. of the metal content of a batch was oxidised by stirring without a flux at 400-450° C.

The No. 3 solder containing zinc is approximately of the composition developed by the Research Department, Westinghouse Electric Company, and there are several points in its manufacture which should be noted. The zinc is only slightly soluble in a lead-cadmium mixture, and it is therefore advisable to add the zinc to the lead before the cadmium. This solder does not oxidise easily, and it may be prepared without the precautions which were found necessary for Nos. 1 and 2. The Westinghouse firm states that at 100° C. this solder is from 50-100 per cent. stronger than 50-50 tin-lead solder and about 30-50 per cent. stronger than pure tin. Our experience is that it is certainly stronger than any of the solders tried to date as well as being much easier to prepare.

Valuable Properties Revealed by Practical Tests.

Samples of these solders were submitted to the Engineering and the Electrical Departments for testing on a practical scale, most of the tests being carried out under observation by the investigator. The first feature observed was the higher melting-point of these solders. This was noted during tests in the anode casting division where the solder was used for finishing-off anode bars. For this work the solder was found to be perfectly satisfactory, the higher melting-point, however, making it necessary to use the blow-pipe for about 10 seconds longer in heating the anode bar. In the soldering of sheet work of different metals, they were found to be perfectly satisfactory. With zinc they worked perfectly, flowing extremely well and making a smooth and strong joint. With brass and copper they were also satisfactory, no difficulty being experienced in getting the solder to take on the surfaces to which it was applied. On galvanised iron they flowed well, behaving slightly better than tin-lead solder in forming a smooth joint whereas tin-lead solder tends to form a lumpy surface to the joint. On lead they were also satisfactory.

A Lead-Cadmium-Zinc Alloy Best for General Purposes.

Different fluxes have been tried and it was found that zinc chloride was the most satisfactory. With resin as a flux the joint appeared to be quite as strong as with zinc chloride, but the solder did not flow quite as readily. The strength of the different joints was tested roughly by tearing the joints after soldering, and at this stage it was found that the No. 2 solder containing lead, cadmium, and tin was not so strong as the others, and after consideration it was discarded. Similar considerations resulted in the adoption of the No 3 solder as being the best for all the purposes for which it has been put—*i.e.*, for all general soldering work involving the use of the iron. It has not been tested completely so far for bath work, in which the conditions of use are somewhat different. It has been noted that the solder tends to burn off the iron on overheating, but this is not to any greater extent than with tin-lead solder. Also the iron may be "tinned" with the cadmium solders as easily and as perfectly as with ordinary solder.

Not Ideal as Wiping Metals.

The different samples were also tested for use as wiping metal. For this purpose it was found that Nos. 1 and 3 were useless as they would not flow freely as a plastic mass, they burnt the wiping cloth and pieces pulled away from the body of the work during the wiping process. Their range of plasticity also appeared to be small. The No. 2 solder containing lead, cadmium, and tin was better in behaviour, but was not equal to ordinary wiping metal.

* See also article "The Technology of Soldering Materials" in *The Chemical Trade Journal and Chemical Engineer*, August 17, 1923, page 185.—Ed., *C.T.J. and C.E.*

Satisfactory for Electrical Uses.

The various samples were also submitted to the Electrical Department and tested under various conditions. For the tinning of cable ends, bus-bars, etc., the samples were found to be satisfactory. The No. 3 sample was also tested for use as a lug filling for cable ends. The completed lug and cable was suspended and weighted with a definite load and a current passed through until the cable pulled from the lug. Under similar conditions it was found that the lead-cadmium-zinc solder was better than 50-50 tin-lead solder, the lug holding for a longer period when this solder was used.

GAS UNDERTAKERS AS CHEMICAL MANUFACTURERS.

DISPUTE AT WOLVERHAMPTON.

THAT the vigilance of chemical manufacturers in regard to the operations of gas undertakings is unabated was shown on Friday, October 5, when Mr. H. C. Honey (Director of Gas Administration at the Board of Trade) held a public inquiry at the offices of the Board in connection with an Order granted to the Wolverhampton Gas Company under the Gas Regulation Act of 1920.

One of the matters proposed under the Order is a transfer of two pieces of land, approximately one acre in extent, and owned respectively by the Wolverhampton Gas Company and the Great Western Railway Company, owing to it having been found that the land belonging to the Gas Company could be made better use of by the Railway Company, and *vice versâ*. As regards the piece of land now owned by the Gas Company, when powers to acquire this were obtained, in 1900—before the time when the chemical manufacturers began to get active* in regard to the operations of gas undertakings as possible chemical manufacturers,—it was stipulated that the Gas Company must not manufacture any chlorine or sulphuric acid, and this restriction is to be attached to the piece of land now to be received by the Gas Company from the Railway Company.

The Alkali Manufacturers' Association and the "Model" Clause.

At the public inquiry referred to, the Alkali Manufacturers' Association appeared and asked, through its Parliamentary Agent, that the usual "model" clause, limiting the purchase of residual products from other gas undertakers for the purpose of manufacturing chemicals, should be inserted in the Order and apply to this small piece of land. The clause in question empowers a Gas Company or Authority to convert residual products arising from its own manufacture of gas, and to purchase and convert those arising from the manufacture of gas by other gas undertakers, but limits the quantity to be so purchased to one-third the quantity of the like residual product arising from the manufacture of gas by the gas company. It gives power also for the purchase, from gas undertakers and elsewhere, of the materials required to convert the residual products, but provides that chemicals shall not be manufactured exclusively from raw materials purchased from sources other than gas undertakings, or in the manufacture of which the use of residual products produced by the company or purchased from other gas undertakings is merely subsidiary.

The Wolverhampton Gas Company resented this, on the ground that no change has been made in the circumstances which existed in 1900, when, it was contended, the local people concerned obtained all the protection they desired. In reply to this, the Alkali Manufacturers' Association's Parliamentary Agent pointed out that in 1900 the controversy as to the operations of gas undertakings in the manufacture of chemicals had not arisen, and that it was justifiable for the Board of Trade to impose the one-third restriction upon the Company now.

The Director of Gas Administration intimated that he would consider the position and give a decision later.

Subsidence in Mines.—The Royal Commission on Mining Subsidence will meet to hear evidence at 5, Old Palace Yard, Westminster, on Monday, October 15, and Tuesday, October 16, at 10.30.

* For detailed reports of the evidence given before the Joint Select Committee of the House of Lords and the House of Commons on Gas Authorities (Residual Products) and the final report of this Committee see *The Chemical Trade Journal and Chemical Engineer*, vol. li. (July-December, 1912).—Ed., *C.T.J. and C.E.*

THE MINERAL PRODUCTION OF CANADA.

PROGRESS DURING FIRST HALF OF 1923.

WE have received from the Office of the High Commissioner for Canada (Kinnaird House, Pall Mall East, London, S.W. 1) a copy of the preliminary statistics of Canadian mineral production for the six months ended June 30, 1923. With the exception of structural materials and clay products, all the usual matter is included, and the figures for 1922 as finally revised are also incorporated. The Dominion Bureau of Statistics is to be congratulated on having made available so early such a quantity of vital statistics. We reproduce below part of the general review as given in the introduction to the report. Readers interested in the detailed statistics may obtain copies of the report on application to The Secretary, Office of the High Commissioner for Canada, at the address given above.

Measured in terms of the metallic and non-metallic mineral output and excluding structural materials and clay products, the mineral production of Canada during the six months ending June, 1923, was valued at 87,152,248 dollars, as compared with 69,861,109 dollars, the value of the corresponding production in the first six months of 1922. The output of these commodities during the twelve months of the calendar year 1922 was valued at 144,762,501 dollars, so the records for the present year show that an appreciable advance has been made both in relation to the output in the first six months of 1922 and also to the entire calendar year.

Recovery in Nickel and Copper.

The outstanding feature of the metal industry during the first six months was the recovery in the production of nickel and copper. The reopening of the smelters and refineries operated by the International Nickel Company and the British America Nickel Corporation resulted in a production of nickel during the first six months of the year which was nearly seven times greater than the production in the first half of last year, and the output of copper was more than double the quantity produced in the corresponding period last year. The copper output during the half-year was greater than the total production during the calendar year 1922; the nickel output was also nearly 60 per cent. greater than the entire quantity made during the twelve months ending December, 1922.

The production of gold and silver was maintained at about the same levels as in the corresponding period in 1922, while the outputs of asbestos, coal, lead, and zinc were higher than in the first half of 1922. Shipments of gypsum, while less in amount, were greater in value; and while the output of salt declined, the quantity sold was greater than in the half-year ending June, 1922.

Power developments in Northern Ontario have been watched with considerable interest by the mining industry. Sturgeon Falls power is now available; Metachewan is expected to be operating by autumn, and the developments on the Quinze River and by the Hollinger on the Abitibi River are being carried forward with a view to the elimination of the recurring spring power shortage that has handicapped these properties up to the present time.

Non-ferrous Metal Prices Approaching 1913 Levels.

An interesting situation is reflected in the price indexes of metals, etc., compiled by the Internal Trade Branch of the Bureau. Taking the average price for 1913 as a base of 100, the index for non-ferrous metals during the period under review stood at 99.9 in January, 97.8 in February, about 102 during the next three months, and 101.4 in June. That is to say, the average prices of non-ferrous metals in Canada during the first six months of 1923 were almost identical with the prices prevailing for these commodities in 1913. Non-metallic minerals, on the other hand, showed an average of approximately 85 per cent. in excess of the 1913 average. The non-metallic group includes such materials as coal, brick, lime, cement, glass, petroleum, pottery, sulphur and salt, etc. Iron and steel prices showed a greater fluctuation than either of the other two groups mentioned, and ranged from 157.3 in January to a maximum of 171.5 in June, the advance being gradual and continuous throughout the period. Mineral prices as a whole advanced slightly during the period, and were maintained at an average of between 55 and 60 per cent. above the prices prevailing in 1913.

BLEACHING LIQUORS FROM LIQUID CHLORINE.*

THE MATHIESON SYSTEM IN THE PULP AND PAPER INDUSTRY.

DURING the last few months several installations for the manufacture of bleaching liquors from liquid chlorine by the American Mathieson system have been made, and a more extended experience has been gained of the practical operation of the system.

Liquid chlorine is unquestionably now firmly established in the pulp and paper industry with every indication of rapidly supplanting bleaching powder. In the preparation of bleach liquors from liquid chlorine a lime or soda base may be used to combine with the chlorine, and it is essential that certain conditions be strictly observed if efficient and economical results are to be obtained. The liquid chlorine must be first vapourised into a gas before being absorbed by the base to guard against the possibility of local supersaturation of the solution with a resultant loss of the available chlorine.

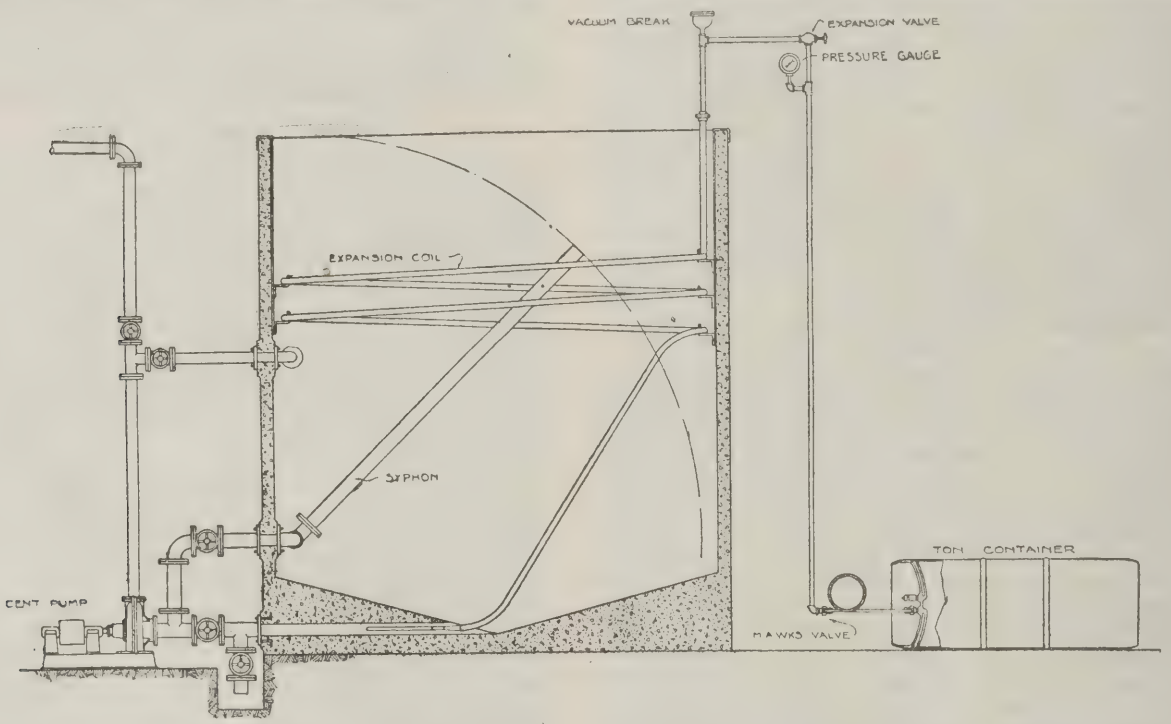
The reaction of the chlorine with the base produces heat which raises the temperature of the solution, the degree of temperature attained being in direct proportion to the amount of chlorine absorbed. Should a temperature of approximately 40° C. be reached decomposition of the hypochlorite begins, chlorates being formed, which increase rapidly as the temperature rises. To avoid losses from this source and maintain the full bleaching strength of the solution, it is important that the temperature of the solution be kept within this limit. It is also of importance that overchlorinating or passing chlorine into the solution in excess of the amount required to combine with the base be avoided. By so doing an acid condition of the solution is produced, its stability affected and a rapid decomposition of the hypochlorite takes place.

Vapourisation of the Chlorine.

The Mathieson system meets these conditions in an exceedingly simple and practical manner. The liquid chlorine is vapourised in a coil which is placed in the tank in which the bleach liquor is prepared and immersed in the liquor. In this way advantage is taken of the cooling effect of the latent heat of vapourisation of the liquid chlorine to counteract the heat of reaction of the chlorine with the base, and thus keep the temperature of the liquor within the limit at which decomposition of the hypochlorite takes place. The accompanying diagram shows a tank in which bleach liquor is prepared. It is of concrete construction 12 feet in diameter by 12 feet deep. It is equipped with an expansion coil of 2-inch heavy lead pipe which is connected at one end to the liquid chlorine supply pipe, the other end which is reduced to 1 inch terminates in the suction line of the pump. The centrifugal pump has a capacity of about 500 gallons per minute. The connection on the suction side of the pump is 5-inch pipe and the discharge line, which is 4-inch pipe, enters the tank about 4 feet from the top and placed tangential to it. The 5-inch drop syphon is connected to the suction line of the pump with valves and fittings as shown. The liquid chlorine supply line is 1-inch extra heavy iron pipe connected at one end to the container by a flexible copper tube. The other end, which is connected to the expansion coil, is fitted with a pressure gauge and expansion valve.

In the preparation of the bleach liquor a high-calcium lime is used to absorb the chlorine and either quicklime or hydrated lime may be employed. While quicklime is probably less expensive, hydrated lime is generally preferred as it can be more conveniently handled and the necessity for slacking and cooling the quicklime is dispensed with.

In operating, the tank is filled with water to within a few inches of the top, the centrifugal pump started and the required amount of lime added. Where quicklime is used about 1lb. per 1lb. of chlorine will be required, with hydrated lime from 1.15lb. to 1.2lb., depending on the quality of the lime. A container holding 2,000lb. of liquid chlorine is connected to the pipe leading to the expansion coil. The container is provided with two eduction pipes which project radially from the centre of the container in opposite directions so that chlorine either in the gaseous or liquid form can be withdrawn. With the valves in a vertical line and the connection made to the lower valve, liquid chlorine is withdrawn and the container can be completely emptied within two hours' time. When the milk of lime in the tank is in good circulation the valve on the container is opened and the liquid chlorine flows through the eduction pipe to the expansion coil, the rate being regulated by the expansion valve.



Use of the Expansion Coil.

The expansion coil should have sufficient area to provide the necessary heat interchange, and it has been found that about 70 feet of 2-inch lead pipe will vapourise from 1,000lb. to 1,200lb. of liquid chlorine per hour. The chlorine gas on leaving the coil enters the suction of the pump where it is absorbed by the milk of lime. The circulation of the liquor by the pump is continued until all the chlorine is absorbed, as indicated by a pressure gauge on the liquid chlorine pipe

* Paper by J. H. MacMahon, of the Mathieson Alkali Works, Inc., Niagara Falls, to the Technical Association of the American Pulp and Paper Industry, on Sept. 20, 1923. From *The Oil, Paint, and Drug Reporter*, Sept. 24, 1923.

line. The container is then disconnected, the circulating pump stopped and the batch allowed to settle. The clear liquor is then drawn off by the drop syphon and pumped to the storage tank. If the volume of the liquor in each batch is 8,000gals., a uniform concentration of 30 grammes per litre of available chlorine of a hydrometer strength of about 6° Bé. will be obtained.

There will be a gradual accumulation of sludge in the chlorinating tank due chiefly to impurities in the lime. It will be found that several batches can be run before it becomes necessary to wash the sludge. The wash liquor is pumped to a separate tank to be used as make-up liquor for succeeding batches and the sludge run to waste. The loss of chlorine from this source should not exceed one per cent. The liquid chlorine can be discharged from the container at a rate of 1,000lb. to 1,200lb. per hour and the batch can be chlorinated, the liquor settled and pumped to the storage tank within 6 hours. Assuming the sludge is washed after a three or four batch run, the tank will have a capacity of at least three tons of liquid chlorine per day of 24 hours or the equivalent of about 10 tons of bleaching powder. Should the sludge, however, be washed in a separate vessel and the tank used exclusively for chlorinating and settling the liquor, the capacity will be increased to 4 tons of liquid chlorine per day.

The Chlorine Containers.

The one ton tank in which the liquid chlorine is shipped is on all forged steel container with a wall thickness of ⅜in. The outside diameter is 30 inches and overall length 80 inches. The head of the drum is lap-welded in the body proper and has a thickness of ¾inch; a bonnet which is easily removed fits over the valves, protecting them from injury. Each drum is equipped with six safety plugs, three screwed into each head, filled with fusible metal of melting-point approximately 150° F. The purpose of these plugs is to relieve the contents before a pressure is reached sufficient to rupture the tank in case of exposure to fire. The weight of the tank alone is approximately 1,300lb. and contains 2,000lb. of liquid chlorine. These tanks are tested for an internal pressure of 500lb. per square inch.

It will be seen from the description given that the Mathieson system embodies novel features which offer many advantages in the preparation of bleach liquors from liquid chlorine. The method employed for vapourising the liquid chlorine ensures a rapid and steady flow of gas and dispenses with the use of evaporating devices which require to be steam heated, and the cooling effect on the liquor by the vapourisation of the liquid chlorine will be found to be of especial advantage, particularly during the summer months, when difficulty is experienced in keeping the temperature of the liquor down to avoid losses of the available chlorine through overheating.

By the introduction of the unit principle the operation is carried out with practically automatic control, and the necessity of skilled labour is not required. The lime can be so finely adjusted that the alkalinity of the liquor is greatly reduced, with a corresponding increase in its bleaching velocity. Bleach liquors of this characteristic combined with a uniform concentration of the chlorine content enable the bleaching of the stock to be carried out with greater efficiency and economy.

With the installation of this system no special equipment is necessary, and it can be readily adapted to existing bleach plants at little expense, as where the individual bleach tanks have not the required capacity to take the full contents of the ton container, two or more tanks can be connected together and operated as a single unit. In installations of this kind the expansion coil with the necessary connections is usually about the only additional equipment required, and so little change is necessary in the existing piping and general arrangement of the tanks that the consumer is in the advantageous position of being able to utilise his equipment either for the use of liquid chlorine or bleaching powder.

Power Plant at Wembley.—Work has been started on the electric power station which is to supply the British Empire Exhibition next year at Wembley with driving power and light. The power station is itself to form one of the exhibits in the Electrical and Allied Industries Section of the Palace of Engineering, and will be representative of some forty electrical manufacturing firms.

SOCIETY OF PUBLIC ANALYSTS.

At the ordinary meeting held at Burlington House, on Wednesday, October 3, Mr. P. A. Ellis Richards, president, in the chair, certificates were read for the first time in favour of: L. E. Campbell, J. T. Hannon, C. L. Hinton, D. W. Kent-Jones, T. W. Alan Shaw, W. H. Simmons, K. E. N. Williams, and P. N. Williams. Mr. Robert C. Grimwood was elected member of the Society.

The Sampling of Coal.

Attention was drawn in a paper on this subject by J. H. Coste, E. R. Andrews, and W. E. F. Powney to the difficulties encountered in sampling coal, which is often a heterogenous mixture, and in consequence of which the variations in composition of different "patches" are extremely wide. These variations are likely to be more extreme in those cases where the bulk is large, and where it is impossible to sample throughout the dump. General considerations that should govern the sampling were suggested, and stress was laid upon the point that if, as often happens, different workers obtain different results from samples taken from the same bulk, the discrepancies are not due to mistakes in working, but are indicative of the variability in composition of the coal. Experiments were described in which (1) it was shown how difficult it is to obtain a homogeneous set of samples from so small a quantity of coal as 70-80lb., and (2) the variation in composition of samples taken progressively from a bulk of about 400lb.

A New Test for Castor Oil.

The method described by H. B. Stocks, in a paper entitled "A New Test for Distinguishing Castor Oil from Other Oils and Determining Its Purity," is based on the following facts: Ordinary soap solutions are alkaline to phenol-phthalein. On titration with standard acid solution a point is reached at which a state of equilibrium exists and the pink colour disappears. The amount of acid required increases with the dilution up to about 1 part in 150, or higher, at which point it becomes practically constant. With soaps of oleic, palmitic, and stearic acids, and soaps from oils composed of these acids, the figures are equivalent to approximately half the total combined alkali. With castor oil soap it is only 3 to 11 per cent. of the total.

To carry out the test, 5 grammes of the oil to be examined are saponified with alcoholic KOH, neutralised, evaporated to remove alcohol, made up to 100 c.c., 10 c.c. being diluted with 250 c.c. of neutralised distilled water and titrated with hydrochloric acid in presence of phenol-phthalein. Castor oil gives figures varying between 4.8 and 7.9, and figures are given in the paper for a number of fats and oils and rosin, in each case very much higher than for castor oil.

Volumetric Estimation of Vanadium in Steel.

The estimation, according to an account given by A. T. Etheridge, is carried out in the same solution in which the chromium has already been estimated by treating the aqueous solution of the sulphates of the metals with permanganate, filtering, removing any colour due to iron, treating with standard ferrous-sulphate solution, and titrating with permanganate. This gives the chromium figure. The solution is then adjusted so that it contains about 10 per cent. by volume of sulphuric acid, excess of ferrous sulphate is added, and the solution titrated with potassium bichromate, using as indicator 5 c.c. of diphenyl carbazide prepared by dissolving 0.5 gramme in 1-2 c.c. glacial acetic acid and diluting to 500 c.c., and adding to each 5 c.c. 3 drops of 25 per cent. sulphuric acid and 1 drop of potassium-bichromate solution, resulting in the formation of a deep purple colouration. About half the indicator should be added within 1 or 2 c.c. of the end of the titration, and the titration continued till the purple colour has practically disappeared. The remainder of the indicator solution is then added, and the end point occurs within 1 or 2 drops with the formation of an apple-green tint. It is necessary to have (1) a small amount of ferrous solution present at the time the indicator is added (2) 10 per cent. sulphuric acid, (3) absence of nitric acid (except in traces).

The Iodimetric Determination of Sugars.

In a paper on the subject by L. C. Hinton and T. Macara, the authors stated that the aldoses—*e.g.*, dextrose and lactose—are quantitatively converted to the corresponding monobasic acids by iodine in alkaline solution at ordinary tem-

perature, provided the proportions af alkali and iodine to sugar are suitably controlled. The slight oxidation of sucrose and levulose found by other observers was confirmed, and the extent of this action was shown to depend considerably on time and temperature of reaction, as well as on the proportions of iodine and alkali used. Using standard conditions, it is possible to determine sucrose accurately in mixtures by titration before and after inversion, but the determination of other sugars is liable to be affected by non-sugar reducing substances. The method is so convenient, however, that it recommends itself technically for approximate determinations of invert sugars.

DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH.

REPORT FOR THE YEAR 1922-23.

THE Report of the Committee of the Privy Council for Scientific and Industrial Research for the year 1922-1923 has just been published (London: H.M. Stationery Office; post free, 4s. 2d.). In view of the present financial condition of the country it has been decided to incur an estimated expenditure of £276,863. for 1923-24 as against £297,437. in 1922-23. Sir George Beilby, Sir Maurice Fitzmaurice, Professor Farmer, and Sir John Snell have been re-appointed to the Council for a further period of three years.

Prospective New Research Associations.

It is pointed out that the policy of co-ordination between the research boards of the Department and outside research establishments has been continued during the past year with great success. Only one new research association—namely, that of the flour milling industry—has been established since July, 1921, although many other prospective associations have been discussed from time to time. Such prospective associations include adhesives, liquid fuels, pottery, paint, preserved foods, china clay, paper, drugs, mining, and grinding plant. It is not possible at the moment to forecast whether any of them will actually come into being. The Sugar Research Association has not yet started full operation. Commenting on the resignation of Sir George Beilby, the Committee states:—

The Resignation of Sir George Beilby.

With great regret we have accepted the resignation by Sir George Beilby, LL.D., F.R.S., a member of our Advisory Council, of his onerous duties as Director of Fuel Research and Chairman of the Fuel Research Board. In view of the many years devoted service he has voluntarily given to his country, first, as a member of Lord Fisher's Board of Invention and Research, a little later, as chairman of the Trench Warfare Research Committee, and, since the beginning of 1917, as the directing brain of the Government investigations into the many-sided problem of fuel economy, we have felt it impossible to press further sacrifices upon him. He had planned and brought into existence the remarkable Fuel Research Station at East Greenwich, he had conducted a number of valuable researches into the use of coal, peat, alcohol, and other fuels, he had been the first to lay firm the foundations of the baffling problem of low-temperature carbonisation, he had solved for the Board of Trade the question of charging for town gas on a scientific and equitable basis, and he felt that the time had come for him to step aside for the organisation of the future work to be placed upon a broader basis. But we congratulate ourselves and the country on his willingness to remain on the Advisory Council and to continue his help as Honorary Adviser to the Fuel Research Board. The Hon. Sir Charles Parsons, K.C.B., F.R.S., and Sir Richard Threlfall, K.B.E., F.R.S., have consented to continue their services, and Sir Richard Threlfall has accepted appointment as Chairman. We have appointed Mr. C. H. Lander, D.Sc., M.I.Mech.E., A.M.Inst.C.E., hitherto Assistant to the Director, to be Director of Fuel Research. It is intended to give him the assistance of a number of small panels of experts to advise him in problems affecting particular industries or group of industries.

Summary of the Year's Finance.

The expenditure of the National Physical Laboratory during 1922-23 amounted to £164,906. Of this sum, £49,404. was provided from fees for tests and special investigations for outside bodies, £32,025. from repayments from the Service departments for work undertaken directly for them, and £8,929. for two programmes of investigation of which the cost was met from special research funds and the interest of the Million Fund in equal proportions. For the current financial year we have decided that routine tests and scientific services, not of the nature of research, undertaken for the civil departments of State shall be carried out on repayment terms. The expenditure on the work of the Fuel Research Board during 1922-23 amounted to £40,695. This sum includes the cost of work at the Station, £37,437.; the cost of research carried out elsewhere than at the Station, £4,798.; other expenditure, £3,258. It does not include grants made on the recommendation of the Fuel Research Board to the Manchester City Council for research on domestic heating, and to Low Temperature Carbonisation, Ltd., for the investigation into a new type of retort, and included in the expenditure on aided researches, to which reference is made below. Receipts from sales and test fees amounted to £765.

The number of industrial research associations which have received licences from the Board of Trade is 25, and, of these, 22 are in actual operation. Grants to associations for the financial year 1922-23 amounted to £95,345., and the balance of the Million Fund remaining unexpended on March 31, 1923, amounted to £721,505. A substantial part of this balance will be required to complete the payments of grants to the associations named during the remainder of their quinquennial grant periods, and allowance must be made for the establishment of new research associations. Any further grant aid to existing associations on the basis of the scheme recommended by the Advisory Council will have to be found out of the unappropriated balance. During the financial year 1922-23, we have made 8 grants in aid of scientific investigations conducted by other bodies, of which 6 were in continuation of previous grants. The expenditure on these grants amounted to £6,244., of which £4,195. was met from the vote of the Department, and £2,049. from the interest of the Million Fund.

During the academic year 1922-23 we made 304 grants to research workers and students-in-training. Of these 252 were allowances to students to enable them to take advantage of the facilities in training in research afforded by various Universities and colleagues or other research institutions, 38 were personal grants to research workers to undertake independent research or to act as scientific assistants to other investigators, and 14 were personal grants to scientific workers to enable them to employ laboratory assistants or to purchase equipment. The total expenditure on these grants during the academic year 1922-23 is estimated at £50,000. as compared with £45,931. during the academic year 1921-22. The expenditure during the financial year 1922-23, covering half of each of these academic years, was £47,905. The expenditure of the Department on headquarters administration during the financial year 1922-23 was £32,567.

The total expenditure of the Department during the financial year 1922-23 was £497,549. This sum was made up of £264,493. from the Exchequer, £48,103. from the interest of the Million Fund, £95,345. from the capital of the Fund, and £89,608. from fees for tests and special investigations for outside bodies, and from contributions towards research funds. The saving on the estimate, due to the restriction of the research programme effected under the direction of the Advisory Council, made it unnecessary to call on the grant-in-aid of £39,500. voted by Parliament in 1921-22 for the unforeseen developments of researches undertaken by the Department, and this grant-in-aid has been carried forward to 1923-24.

The Advisory Council.

The Advisory Council, which is the executive of the Department and responsible for devising an ordered policy of scientific research within the financial provision made by the Privy Council Committee, publishes a detailed account of its activities during the year under review. We abstract below the main features of this report in so far as it relates to the work of the individual Research Boards and Committees of the Department. Work that has already been published will in most cases not be referred to. (It may be mentioned here that Sir William S. McCormick is the administrative chairman of the Advisory Council, and that the other members are Sir G. T. Beilby, Professor Sir J. Cadman, Professor J. B. Farmer, Sir M. Fitzmaurice, Sir G. G. Goodwin, Mr. W. B. Hardy, Principal J. C. Irvine, Sir H. A. Miers, Sir J. F. C. Snell, Sir J. J. Thomson, Sir

R. T. Threlfall, Professor S. Young, and the secretary Sir H. Frank Heath.)

Work of the Fuel Research Board.

During the year, new experimental vertical retorts, based on Scottish shale oil practice, have been erected with a view to low temperature carbonisation on a commercial scale. It is proposed to briquette a blend of coking and non-coking coals by raising them to a temperature below the decomposition point, and then subjecting them to pressure without any added binder. The briquettes will then be carbonised in the new retorts. A considerable amount of preliminary work was necessary before the details of the retort and briquetting press could be decided on, and the plant has not yet been running sufficiently long for any conclusion to be reached.

Comprehensive tests have been carried out on the efficiency of water-gas plant working under various conditions. The results have been published in Fuel Research Board Technical Paper No. 6. An investigation has been carried out at the request of the Development Commission into the carbonisation of seaweed, with a view to examining the possibility in the present circumstances of reviving the seaweed industry on the Atlantic coast. A report on this is being prepared for publication.

Survey of the National Coal Resources.

The Committee for the Survey of the Lancashire and Cheshire area, the establishment of which was reported last year, has been at work throughout the year, and valuable data and experience have been gained. It has been possible to prepare a preliminary correlation of data for this area, but much more information must be collected before this can be either as complete, or as reliable, as that published for the Yorkshire, Nottinghamshire and Derby area. Two of the most important of the seams in the Lancashire and Cheshire area have been dealt with in a fairly exhaustive manner, and the question of the publication of the results is now under the consideration of the local committee. The work carried out at H.M. Fuel Research Station, both in large-scale work in the retorts and by tests of special samples of a few cwt., has given valuable information as regards these seams. This work forms an important part of the examination of the seams, and supplements the purely laboratory examination of samples.

The Committee on the Sampling and Analysis of Coal has presented an interim report on methods of analysis of coal, recommending those it considers the best. The report is based on a large amount of experimental work carried out by the Committee during the past eighteen months, and is now in the press. The Committee has still to deal with the difficult question of sampling.

Progress in Power Alcohol Investigations.

Further knowledge has been accumulated in regard to the optimum conditions for carrying out the acid hydrolysis of cellulosic materials, and the mechanism is now well established to ensure the maximum production of pentoses with a very low strength of acid at a moderate temperature and pressure. The fermentation of the pentoses, by means of Bacillus *acetoethylicum Anthrop*, has been the subject of a number of laboratory and semi-technical scale experiments with wheat-straw and African grasses, and the following conclusions have been drawn from them:—(1) For the preparation of the mass, the hydrolysis of the cellulosic material must not be carried too far, otherwise inhibitory substances are formed which have a retarding effect on the progress of the fermentation. (2) It is unnecessary to add food, or marble, or cinders to the mash, as was indicated in the original American experiments. (3) The optimum hydrogen ion concentration for growth and fermentation must be sought between 7.7 and 8.8 per cent.

Supplies, in quantity, of African grasses are now being procured for manufacturing scale experiments to enable the economics of the process to be studied. This fermentation produces a mixture consisting of approximately 85 per cent. of ethyl alcohol and 15 per cent. of acetone.

Work on the direct fermentation of cellulosic materials by means of micro-organisms has included: (1) a search for micro-organisms capable of fermenting cellulose direct; (2) the determination of the minimum concentration of glucose required by yeast for alcohol production; (3) the determination of the maximum concentration of glucose accumulated by various types of mould during their growth on and decomposition of cellulose. The results so far obtained are inconclusive.

The production of alcohol on a commercial scale for use as an ingredient of a liquid fuel for internal combustion engines has been commenced in this country. The Distillers' Company, Ltd., has erected mixing plants at three centres, and is supplying "Discol," which is a mixture of 50 per cent. denatured alcohol and 50 per cent. of a blend of hydrocarbon spirits.

The Second Memorandum on Fuel for Motor Transport, circulated to the Dominions and Colonies in 1921, was duly considered by some of them, and the following is a brief summary of the reports received, together with information obtained from other sources.

The Commonwealth of Australia.—The possibility of producing power alcohol commercially in Queensland from sweet potatoes grown for the purpose, and from waste molasses, has been privately investigated, and, as a result, attempts are being made to start the industry. Meanwhile, power alcohol is being made from molasses on a small scale at the Commonwealth Acetate of Lime Factory near Brisbane.

New Zealand.—The use of the pulp resulting from the preparation of New Zealand flax (*Phormium Tenax*) as a source of alcohol, is the subject of experiment, and, according to the *New Zealand Journal of Science and Technology* (1922.5.237), motor fuel is being successfully produced from molasses and waste vegetable materials.

Union of South Africa and the Protectorates.—"Natalite," consisting of alcohol and ether, is being produced, mainly from molasses, in South Africa in considerable quantities, but not on a sufficient scale to meet all requirements. There would appear to be no early prospects of the manufacture of power alcohol in Basutoland, Bechuanaland Protectorate and Swaziland.

Southern Rhodesia.—The South African Syndicate issued a prospectus in September, 1922, in connection with the manufacture of "Acetol," a liquid fuel for internal combustion engines consisting of 80 per cent. alcohol made from molasses, and 20 per cent of other ingredients of which acetylene is one.

Kenya Colony and the Protectorates of Nyasaland.—There are possibilities of the production of alcohol for power purposes from the molasses of the sugar refineries recently started and about to be started in these Colonies.

Gold Coast.—Experiments on the cultivation of cassava as a raw material for the manufacture of power alcohol are being carried out.

Nigeria.—In view of the value of cassava as a foodstuff and of the cost of its cultivation, it was considered that there is no present prospect of the production of power alcohol in Nigeria from this root, which would otherwise have been a very suitable material for the purpose.

Federated Malay States.—The possibilities of producing alcohol for power purposes from the juice of the nipah palm are being investigated.

British Guiana and the West Indies.—Several sugar firms in British Guiana have investigated the possibilities of producing motor fuel locally from waste molasses, and the Government is assisting the enterprise by temporarily exempting the industry from taxation. The opinion was generally expressed by the authorities of the West Indian Islands that there were little or no prospects of the manufacture of alcohol for power purposes. In Barbados it was reported that a local syndicate was considering the question of its production from residual molasses, and in British Honduras that the local sugar planters were doing likewise. In view of the falling off in the requirements of rum there is an increasing tendency, however, to turn the residual molasses of the sugar refineries into power alcohol.

Production of Formaldehyde by Hydrocarbon Oxidation.

Investigations on behalf of the Chemistry Research Board have been continued at the Royal Naval Cordite Factory on the oxidation of hydrocarbons. The chief object of these investigations is to provide, if possible, a method of manufacturing formaldehyde in this country. The laboratory investigations on the subject have continued and extended the results of previous investigations. Several papers, embodying the scientific results of the work, have been published. The laboratory results are of such a nature as to indicate a possible, though not very promising, commercial method of manufacturing formaldehyde, and the Board decided to continue the investigations on a semi-manufacturing scale in order to obtain definite data on the possible value of the method. This work has been proceeding throughout the year. It is not yet complete, but so far as it has gone at present, it does not appear likely that a successful commercial method will be evolved.

At the Research Department, Woolwich Arsenal, attempts were made to produce formaldehyde by the interaction

between hydrogen and carbon monoxide, and hydrogen and carbon dioxide, respectively, in the presence of various catalysts. Only traces of formaldehyde were obtained in each case. Experiments were also made on the partial oxidation of methane in presence of silica-gel as catalyst, and these gave some measure of success, although the results were less promising than those obtained at Holton Heath without a catalyst. It was thought that the addition of carbon dioxide to the methane-oxygen mixture might increase the yield of formaldehyde on the methane consumed, and this appeared to be supported by experimental evidence.

The investigations on the chlorination of methane, undertaken at Oxford, have yielded results of considerable interest, and arrangements have now been made, with the consent of the Admiralty, to transfer the work to the Royal Naval Cordite Factory where experiments on a larger scale will be carried out.

Experiments on luminous radium compounds have been continued at the National Physical Laboratory. The variation of the rate of decay of luminosity with radium content has been further investigated. The possiblity of substituting mesothorium for radium has been examined. The substitution has some disadvantages, owing to the shorter life of mesothorium; but it may be of practical advantage under certain conditions.

Causes of the Oppau Explosion.

Investigations have been carried out with the object of ascertaining the causes of the explosion of ammonium sulphate-nitrate at Oppau in Germany. The Government Chemist made a thorough examination for the Board of samples of the salt obtained from Germany. No impurities such as could be held responsible for the explosion were detected. The salt appeared to be in the form of mixed crystals, and not a double salt. The cause of the hardening of the salt is attributed to the presence of a small quantity of moisture: in this condition it cakes under pressure. Experiments have been carried out at the Research Department, Woolwich, on the possibility of detonating the salt. The results are mainly negative in character; it has been found impossible to cause detonation, even under very favourable conditions. The exact cause of the explosion remains, therefore, somewhat obscure.

Corrosion of Aluminium and Its Alloys.

Work on the corrosion of aluminium and its alloys has been continued under the direction of a Committee of the Institute of Metals. In spite of the difficult nature of the subject, substantial progress has been made. Attention has been mainly directed to the protection of the metal by the formation of a skin of oxide. It has been established that while this method delays corrosion under ordinary conditions, it fails under very severe conditions such as are experienced when metal is alternately wetted by sea-water and then dried. The film of oxide has strong adsorbent properties, and, by the adsorption of suitable materials which are very difficult to remove, the protective properties of the film are greatly enhanced. Trials made of samples of aluminium and certain of its alloys, protected by these means, have hitherto proved extremely satisfactory. An account of the work will be published.

Recent Adhesives Research.

Since the publication of the first report of the Adhesives Research Committee, attention so far as the composition and properties of adhesives are concerned has been concentrated upon glue and gelatin to the exclusion of other adhesives. The properties of gelatin alter considerably with its ash-content, and, in order to study the fundamental properties of this substance, it was deemed advisable to work out a method whereby large quantities of electrically-neutral gelatin containing only a small percentage of ash could be prepared. This was successfully accomplished, and large-scale preparations are now being undertaken.

During the past year, a new line of research has been initiated at Bristol University. Little is known as to the fundamental nature of adhesion, and it was considered that this problem was one of the utmost importance. Professor J. W. McBain, Ph.D., F.R.S., undertook to direct work on this topic, and already promising results have been obtained. The final test of a glue must be the tensile strength of a glued joint prepared from it. Such work is being conducted at the Royal Aircraft Establishment, where a close study of the nature of the rupture of glued joints of various types is being made.

Oxygen Research.

During the year the report of the Oxygen Research Committee has been prepared and will shortly be published. This report consists principally of a description of the Committee's own investigations and results, particularly in the improvement of the known methods of handling liquid oxygen and liquid air on a practical commercial scale. Of these methods the Committee has been principally concerned with the development of the double-walled vacuum vessel as a container for the liquid.

Gas Cylinders Research.

At the close of the year 1921-22, after the publication of its first report, the Gas Cylinders Committee turned its attention to the problems relating to cylinders for the transport of gases in the liquid state, and to the consideration of the possibility of the use of alloy steel or other alloys for the manufacture of light cylinders. The progress made in these researches is as follows:—

Liquefiable Gases.—A review was made in the first place of the known information on the physical properties of the so-called "non-permanent" gases which came under the purview of the Committee. It was found that not only were there many discrepancies, but that, in some cases, information of vital importance to the work of the Committee was not available. It was decided, therefore, to undertake the experimental verification of the uncertain data, and the determination of the unknown data, at the National Physical Laboratory. The necessary experimental plant has been designed and constructed, and these investigations are now in progress. In order further to assist the Committee, a questionnaire was circulated to gas-compressers regarding the corrosive effects, if any, of liquefied gases on cylinders, and regarding the nature and quantity of impurities found commercially in these gases. A good response was made by the trade to the Committee's request.

Cylinders of Alloy Steel.—After reviewing the possibilities of manufacturing cylinders of various alloy steels, it was decided to secure if possible the co-operation of steel and gas-cylinder manufacturers. A questionnaire on the subject of alloy steels suitable for the manufacture of gas cylinders was therefore sent to a number of firms, and, as a result of the replies received, an order has been placed with three firms for the supply of a number of experimental cylinders.

Cylinders of Duralumin.—In order to explore further the possibility of the production of light cylinders for special purposes, a specification was drawn up for the manufacture of cylinders of duralumin. Some experimental cylinders have been manufactured and supplied, and an exhaustive series of tests is now in progress at the National Physical Laboratory.

THE FORTHCOMING WORLD POWER CONFERENCE.

ARRANGEMENTS FOR NEXT YEAR'S MEETING AT WEMBLEY.

CONSIDERABLE progress has been made in the preparations for the World Power Conference, to be held at the British Empire Exhibition, Wembley, from June 30 to July 12, 1924, under the Presidency of the Earl of Derby. The conference, as has already been announced, is being promoted by the Council of the British Electrical and Allied Manufacturers' Association, in co-operation with technical and scientific institutions and industrial organisations in Great Britain and other countries, to consider how the industrial and scientific sources of power may be adjusted nationally and internationally. This purpose is to be achieved by the consideration of the potential resources of each country in hydro-electric power, oil and minerals, the comparison of experiences, the discussion of methods of technical education in different countries with a view to the improvement of existing facilities, etc., whilst a good deal of discussion will also be directed to the possibility of establishing a permanent World Bureau for the collection of data, the preparation of inventories of the world's resources, and the exchange of industrial and scientific information through appointed representatives in the various countries.

Scope of the Conference.

The conference has been divided into five divisions, as follows:—(1) Power Resources; (2) Power Production; (3) Power Distribution; (4) Power Utilisation; (5) General.

These five divisions are sub-divided into 13 sections Thus, Division 1 consists of Section A, which will review national power resources and will cover a general survey, the investigation of national resources, power resources available and utilised, administration, and the electrical power market. Division 2 is to be divided into five sections, B to F, dealing respectively with water power production, the preparation of fuels, steam power production, internal combustion engines, and power from other sources. Division 3 is to consist of Section G only, which will cover power transmission and distribution. Division 4 will consist of four sections—namely: (H) Power in industry and domestic use; (J) Power in electro-chemistry and electro-metallurgy; (K) Power for transport; and (L) Power for illumination. The final division has two Sections, M and N, the former to deal with economic, financial, and legal matters, whilst the latter will deal with research, standardisation, education, health, publicity, and general problems.

Papers to be Presented and Discussed.

So far the following papers have been arranged, for presentation to and discussion by the appropriate sections: —"The Coal Resources of the World," by Sir Richard Redmayne, K.C.B.; "National Review of Water Power in Great Britain and Ireland," by Professor A. H. Gibson; "Problems Relating to Run-off, Storage, and the Allocation of Catchment Areas in Great Britain and Ireland," by W. J. E. Binnie; "Points Affecting Economy in General Lay-out and Design," by C. M. Norrie and W. H. Munro; "The Scope of Development to meet Progressive Demands," by E. C. Bergstrom; "Steam Generation," by Sir James Kemnal; "Steam Turbines," by the Hon. Sir Charles Parsons, K.C.B., F.R.S.; "Internal Combustion Engines," by James Richardson; "The Transmission and Distribution of Electrical Energy," by C. H. Merz; "Large Generators," by A. B. Field; "High Voltage D.C. Generation and Distribution of Electrical Energy," by J. S. Highfield; "Mechanical and Hydraulic Variable Transmission of Power," by Dr. H. S. Hele-Shaw, F.R.S.; "The Application of Electrical Energy," by Sir Alexander Kennedy, F.R.S., "The Application of Power to Rail Transport," by Roger T. Smith and C. B. Collett; "The Application of Power to Road Transport," by Colonel R. E. Crompton, C.B.; "Illumination," by C. W. Sully; "The Financial Aspect of Hydro-Electric Development," by George Balfour, M.P.; "International Standardisation," by C. le Maistre, C.B.E.; "The Education of the Apprentice," by Professor A. P. Lawrie and Professor F. G. Baily; "The Education and Training of the Engineer of the Future," by A. P. M. Fleming, C.B.E.; "The Importance of Greater Public Interest in Mechanical Progress," by T. C. Elder; "Co-operative Publicity in the Public Supply of Electricity," by J. W. Beauchamp; and "The Study of the Human Element in Production," by D. R. Wilson.

Participating Countries and Officials.

A number of other papers are under consideration. The participating countries to date are Australia, Austria, Belgium, Canada, Czecho-Slovakia, Denmark, France, Great Britain, Greece, Holland, India, Italy, Norway, Roumania, Sweden and the United States. Mr. D. N. Dunlop is the Organising Director, other officers appointed to date being: —*Chairman*, Programme Committee: Mr. Roger T Smith; *Secretary*, Water Power Section: Lieut.-Col. C. M. Norrie, D.S.O.; *Secretary*, Engineering Sections: Mr. A John Dannhorn; *Secretary*, Chemistry and Physics Section: Mr. H. Talbot (Representing the Chemical Engineering Group of the Society of Chemical Industry); *Secretary* to the Organising Director: Mr. W. M. Burt. The official languages of the conference are English and French.

American Alkali Prices.—The following contract prices for alkali products during the remainder of this year and the whole of 1924 have been announced by the Mathieson Alkali Works, Inc. The prices in all cases are in dollars per 100lb.: 58 per cent. light soda ash, in bulk 1.33, in 200-lb. bags 1.45, in 300lb. barrels 1.69; 58 per cent. dense soda ash, in bulk 1.42, in 300lb. bags 1.51, in 400-lb. barrels 1.75; 76 per cent. solid caustic soda, in 700lb. drums, 3.165; 76 per cent. ground caustic soda, in 425lb. drums 3.60, in 425lb. barrels 3.85; 76 per cent. flaked caustic soda, in 400lb. drums 3.60, in 400lb. barrels 3.85; U.S.P. bicarbonate of soda, powdered, in 112lb. kegs 2.25, in 330lb. barrels 2.00, in 400lb. barrels 2.00, in 200lb. paper-lined bags 1.90, in 200lb. plain burlap bags 1.875, in bulk 1.75. Prices of granular U.S.P. bicarbonate of soda are 37.5 cents per 100lb. higher.

THE BRITISH EMPIRE EXHIBITION.

PROGRESS MADE IN THE CHEMICAL SECTION.

MR. WOOLCOCK, the General Manager of the Association of British Chemical Manufacturers, met the editors of the various technical journals at the offices of the Association in Piccadilly on Monday last, to discuss with them the progress which has been made with the preparation of the Chemical Section. In the course of the conversation, Mr. Woolcock said:—

"The Chemical Section which is being organised by the Association and occupies nearly 40,000 square feet in the Palace of Industry will be built in such a way as to form a Hall within the Palace. About £100,000. will be spent in presenting to the public a picture of the present state of British chemical industry. No important firm in the industry will be unrepresented, and the whole of the individual exhibits numbering about one hundred will, by reason of their position and character, combine to form a magnificent illustration of the industry. The treatment of the individual stands is being done on lines which have never before been attempted, and the old and somewhat hideous structures which have disfigured exhibitions in the past will not appear.

Considerable attention has been paid to the lay-out and to the decoration of the Chemical Hall. There will, for example, be about two hundred yards of a specially-painted frieze illustrating various operations in chemical manufacture, and as the majority of the stands are being designed by the same architect the treatment of each stand is likely, while maintaining the individuality of the occupier, to present a very pleasing picture of the Hall as a whole. It has not, however, been considered sufficient that we should merely show visitors examples of the products of the industry. The best possible exhibition of this kind would leave one question unanswered. The visitor may be satisfied that he is witnessing a demonstration of the position to which the industry has attained, but what the critical person who examines the exhibit requires to know is whether there is behind this example of what has been achieved a scientific basis which will ensure the continuance of this progress. For this reason in the centre of the Chemical Hall there is to be illustrated the progress which has been made in pure chemistry during the past twenty or thirty years, with a view to showing that the stream of scientific invention in this country is still flowing steadily onwards."

The "Pure Chemistry" Exhibit.

Mr. Woolcock then proceeded to outline the scheme of classification which has been adopted for the Scientific Section, and enumerated a number of names of those scientists who have already promised their assistance and very few of the outstanding scientific men of the day were absent from the list. Continuing, Mr. Woolcock said:—"The Scientific Section is being organised by a Committee consisting of representatives of the following bodies:—The Chemical Society; the Institute of Chemistry; the Society of Chemical Industry; the Society of Dyers and Colourists; the Pharmaceutical Society; the Institution of Petroleum Technologists, and the Institution of Chemical Engineers.

This Committee is working in close co-operation with the Royal Society. Sir Herbert Jackson acts as the representative of the Royal Society on the Committee and myself in a similar capacity on the Royal Society Committee. In this way we shall prevent any overlapping. In order that both the general public and scientific persons may have a record of the exhibit, it is proposed to publish a number of pamphlets specially written for the purpose dealing in popular language with the various classes of exhibits in the Scientific Section. In addition to this it is proposed to publish in more technical language a work, which will not only explain the scientific exhibits, but which will put on record in a very complete form the state of our knowledge in chemical matters at the date of the exhibition. It is anticipated that there will be a very large demand for this valuable record, and that it is likely to find a place on the bookshelf of every scientist. The various chapters will be written by the acknowledged experts in their subjects, and I anticipate that the contents of this book will be very valuable matter for reference."

Co-operation of the Technical Press.

Mr. Woolcock invited the assistance of the editors in making widely known what was being prepared for the

exhibition next year, and the following resolution was unanimously passed:—"That our best thanks be extended to Mr. Woolcock for his courtesy in inviting the editors of the trade and technical Press to meet him, and that we undertake to give him any assistance in our power in organising the publicity service of the Chemistry Section."

THE DIRECTORATE OF THE DYESTUFFS CORPORATION.

SIR W. J. POPE'S CRITICISM AND THE CHAIRMAN'S REPLY.

On Monday, October 8, the following letter from Sir William J. Pope of Cambridge University was published in the *Morning Post*:—

Sir,—The national organisation for re-instating the coal-tar colour industry in this country, the British Dyestuffs Corporation, Limited, again claims public attention by the retirement of Mr. A. G. Green, F.R.S., its director of research, by reason of "his dissatisfaction at the absence of technical knowledge upon the board of directors and his belief that the permanent establishment of the dyestuffs industry in this country is impossible under these conditions." The reason given is but a succinct restatement of the condemnation, so widely expressed, of the Government scheme when in its initial stages; it translates the common observation that every large and successful manufacturing concern in the world is directed by men acquainted with the objects of manufacture, and that failure always results when such men are excluded from the directorate. The establishment of a sound dyestuff industry in Great Britain is so vital to the national well-being that it is worth while reviewing the history of the recent attempt made to achieve this end, and to point out why the attempt is failing.

The Board of Trade's Attitude in 1915.

The guiding principles of the scheme under which the Corporation is now working were forced upon the country by the Board of Trade early in 1915. They embody the experience of Mr. J. M. Robertson, then Parliamentary Secretary to the Board of Trade, that "he knew of many chemical concerns which had been ruined by having highly-gifted scientific men on their boards. When such men were on the boards the position of the other directors was often a difficult one." The fact that Mr. Robertson's statement was entirely untrue has really no bearing on the subject; we all know of large business concerns which have failed because presided over by brilliant business men whose cheerful optimism led them ultimately to penal servitude. But what was stated served the purpose of the Board of Trade and of its President, Mr. Walter Runciman, which was to establish a dyestuff industry under political auspices untrammeled by directors possessing any knowledge of dyestuff manufacture. Whilst the Board of Trade in 1915 was devoid of chemical talent, and its chiefs, Mr. Runciman and Mr. Robertson, took the dyestuff industry as an incident in their political activities this Government Department was able to force its project upon the country—although the project was almost universally condemned by the Press and although many of the leaders in science and technology pronounced failure to be inevitable. Unfortunately, a perusal of the newspaper criticisms early in 1915 will surprise the reader by the accuracy with which the gloomy forebodings of the experts who knew about the subject have been fulfilled.

Both Mr. Runciman and Mr. Robertson had the political temperament: that is to say, each possessed that certainty and precision of judgment concerning intricate problems, of which he knew nothing so characteristic of the amateur. They have handed their method of administration of national affairs on to worthy successors, and have lost interest in the dyestuff industry. Yet these gentlemen were able to launch their amateur dyestuff proposition, the Government taking up £1,700,000. of share capital. The great names in chemical industry do not figure in the list of original subscribers to the share capital. The British Dyestuffs Corporation still runs, or rather limps, under amateur auspices, because the amateur realises that, in presence of the expert, "the position of the other directors was often a difficult one," and consequently makes expert knowledge a disqualification for a seat on the board. This is the reason for Mr. Green's retirement from the service of the Corporation.

Amateur Constitution Still Preserved by Directorate.

Throughout its frequent changes the directorate of the Corporation has preserved the amateur constitution framed by its founders; it insures against efficiency by a rigid exclusion of any of the many great industrial chemists who have done so much to keep our country in the forefront as a centre of chemical manufacture. The Chairman may be an eminent legal luminary, he may be a Writer to the Signet, or he may be, as at the moment, a business man of proved ability and integrity. Apart from the Chairmanship, the directorate baffles comprehension by the kaleidoscopic rapidity with which distinguished amateurs join the board, and after a brief space retire into well-earned obscurity. At the moment the board includes men distinguished in Colonial affairs, railway management, accountancy, etc., but no one with any knowledge of chemical manufacture; it also comprises one of our greatest soldiers, a universally respected Field-Marshall, who has served in the Regular Army since 1877. It is but fair to note that the directors share the financial vicissitudes of the other shareholders; the actual value of the shareholdings of the six directors is about £2,000. All will agree that six amateurs, directing a £10,000,000. concern involving a most intricate manufacturing business of which they are entirely ignorant show much public spirit in sinking £2,000. of their own money in the enterprise.

The Depreciation of B.D.C. Shares.

The proof of the efficiency of an amateur directorate is, of course, to be found in the results achieved; here little criticism is possible because the Corporation has progressed in entire accord with the programme obvious eight years ago. After eight years of unexampled opportunity—difficulty of import and the certainty that the country would support any businesslike and non-political scheme for establishing an essential industry—the capital of £10,000,000. has depreciated to about one-third of its original value at present Stock Exchange quotations. The amateur has really done rather well; he was expected, on the average scientific and technical chemical anticipation, to destroy about £1,000,000. of capital value per annum. But the comedy still continues because some £3,000,000. worth of assets still awaits annihilation. The gold brick was invented to meet the needs of the business man.

How the Undertaking May Yet Be Saved.

Doubtless the shareholders desire to save the fraction which yet remains of the original capital and still wish to see a sturdy coal-tar industry established in this country. Their course of action is clear. They should replace the Colonial, railway, accountancy, and military experts on the board by a few sober business men accustomed to collaborate in big business enterprises, and add to the directorate a couple of talented technical chemists and an experienced chemical engineer, these three chosen from the scores who are now engaged in worthily developing the vast chemical industries of this country in loyal co-operation with their business colleagues. By so doing the Corporation would tap a class of expert hitherto foreign to its constitution; had it commanded such a directorate from its inception, and so attracted the whole-hearted participation of the dyers and other colour users, the British Dyestuffs Corporation would have been to-day in a secure position.

One note of warning may be struck here. On each of the numerous occasions when a scientific or technical member of the staff of the Corporation has retired, having realised that the amateurs are stifling the enterprise, the news and technical press has been loaded up with sententious articles indicating that the resignation results from disagreement with the policy of the board, and pointing out that the scientific or technical man is often an uncommercial idealist, prone to disregard all aspects of a business proposition other than those of scientific research. Without labouring these questions, it may be stated as obvious that the main cause of lack of success of the British Dyestuffs Corporation resides in the fact that, after eight years of existence, the amateur directorate has been unable to distinguish even one technically trained person from among the many hundreds who have passed through the works as worthy to take a place on the board and to discuss technical and business problems on terms of equality with his colleagues. Throughout these eight years no man of conspicuous standing as an administrator and technical expert in our great chemical industries has been persuaded to accept a seat on the board.

Meanwhile Mr. Green has resigned because the directorate of the British Dyestuffs Corporation includes no person who

knows anything about either the nature or the manufacture of its multitudinous products; the next move would seem to lie with the shareholders.—Yours, etc.,

William J. Pope.

Sir William Alexander's Reply.

On Wednesday, October 10, the following letter from Sir William Alexander appeared in the *Morning Post*:—

Sir,—It is not the desire of my Board to be drawn into any discussion, but the statements of Sir William Pope always demand attention. You will therefore permit me perhaps to state the facts very briefly.

Owing to the present abnormal trade depression, my Board, after close consultation with the scientific men within the Corporation's organisation, decided upon a policy of curtailment—but only curtailment—of the heavy expenditure on research. This policy was confirmed by the shareholders in a general meeting.

The peremptory refusal of any member of the staff to carry into effect a decision taken after the fullest consideration could only lead to one course, which, in fact, was taken.

It is proper to say that Mr. Green's resignation will not denude the Corporation of ample technical service, nor affect, we hope, its progress. On the other hand, it will assist those who have financial interests to safeguard to effect some justifiable and necessary economies.

Professor W. H. Perkin to be New Research Director.

Those interested may care to know that Professor W. H. Perkin, F.R.S., who for some considerable time has been on the scientific staff as Controller of the Corporation's Research Colony at Oxford University, will now add to his duties by advising and supervising the research staff at headquarters. Professor Perkin's knowledge and experience of dyestuffs require no comment.—Yours, etc.,

Wm. Alexander, Chairman.

HIGH-PRESSURE STEAM FOR POWER GENERATION.

GERMAN WATER-TUBE BOILER FOR 850lb.

As is well-known the tendency everywhere nowadays is to adopt super boiler pressures for power generation. Not only is the standard power station practice to-day in Great Britain 350lb. and 700° F., but in the United States this figure is at present over 400lb. We now understand that the firm of A. Borsig of Berlin is constructing a large water-tube boiler, with an evaporation of 15,500lb. of steam per hour, but which is to work at 850lb. gauge pressure.

The design embodies one top drum and two bottom drums, connected by slightly bent tubes, the drums being constructed of a heavy forging made from one piece of metal, without the use of riveted or welded joints, and subsequently annealed after forging, whilst special arrangements are made with steel plates so that the drums do not come into direct contact with the hot flue gases. This (the fact that no abnormal stresses will be set up in the thick drums) is claimed to be one of the essential portions of the design.

The general principle is based on experimental work carried out for a number of years past by W. Schmidt, also well known for his work on high-pressure superheaters, who contends that there is no real difficulty in working ordinary water-tube boilers at these enormous pressures, providing that the metal is made sufficiently thick, and that due arrangements are included to prevent internal stresses. The boiler does not include an economiser in the ordinary sense of the word, because the very high temperature of the boiler water permits of a low exit gas temperature, but what may be called the last section of the boiler is arranged in the form of long vertical tubes, which can really be considered as an integral economiser, lowering the final flue gas temperature to about 430° F. These tubes are of steel, the same as the rest of the boiler, but it is claimed that no undue corrosion takes place if the feed-water is "degassed" and heated.

Special Type of Water Gauge.

One of the troubles in connection with this type of boiler—and a small boiler on these lines was constructed by Schmidt in 1910, having 744 square feet heating surface and producing 1,500lb. of steam per hour at 850lb. pressure and 840° F.,—is the continual bursting of the gauge glasses. For this reason a special water level gauge has been constructed a considerable distance from the boiler, consisting essentially of a "U" tube, the lower part of which is made of glass containing mercury. Both the arms of the "U" tube are filled with condensed water, on the lines used in the working of steam meters, so that the actual indication of the level, as given by the mercury, is cool and not under pressure, and the small difference is read by means of a magnifying glass. It is stated that no trouble results from leaks, and this small boiler is said to have operated for about 15,000 hours, including starting up and shutting down say 1,500 times, without any trouble.

The object of generating steam at such enormous pressures is to use it in an engine or turbine, and to exhaust at normal pressures for ordinary use. In this particular case a back-pressure reciprocating engine is used, whilst remarkable results can be obtained also with a condensing quadruple expansion steam engine.

DEATH OF MR. WILLIAM THOMSON.

A PROMINENT MANCHESTER CHEMIST.

It is with great regret we record the sudden death, on Thursday week, at the age of 82, of Mr. William Thomson, F.R.S. Ed., F.I.C. The late Mr. Thomson, who died suddenly in his laboratory, had been a prominent figure among the chemists of Manchester and London for over half a century. Born in 1851, in Glasgow, he came to Manchester in 1869, and entered as assistant to Dr. Grace-Calvert, the Royal Institution Laboratory in Princess Street, the oldest chemical laboratory in Great Britain. Four years later, at the age of 22 years, he became a partner in the firm of Grace-Calvert and Thomson, and, on the death of Dr. Grace-Calvert a little time later, took sole charge of the practice, and combined with this the office of Public Analyst for Stockport, which he continued to hold until his death.

The late Mr. Thomson joined the Literary and Philosophical Society in 1873, and served on the Council for many years, acting as president from 1917-19. In November of last year, it will be remembered, he presented to the Society the actual tubes containing sulphides of calcium, barium, etc., which he demonstrated to Sir William Crookes in 1877, and which proved to be the first of three steps which led to the discovery of "X-rays" by Professor Rontgen. In recognition of his contributions to science, he was elected a Fellow of the Royal Society of Edinburgh, and he was one of the original members of the Society of Chemical Industry. He was also one of the leading forces in the Institute of Chemistry, of which he was elected a Fellow in 1877.

AMERICAN BENZOL PRODUCTION.

LARGE GROWTH IN RECENT YEARS.

According to figures given by D. W. Jayne, the president of the firm of Jayne and Sidebottom in *Drug and Chemical Markets* (September 19, 1923), the quantities of benzol produced in the United States during the years 1904 to 1920 inclusive, were as follows:—

Benzol Production in U.S.

	Gallons.		Gallons.
1904	285,000	1912	2,300,000
1905	360,000	1913	3,000,000
1906	400,000	1914	3,000,000
1907	375,000	1915	9,000,000
1908	485,000	1916	27,000,000
1909	885,000	1917	38,000,000
1910	1,500,000	1918	55,000,000
1911	1,600,000	1919	63,000,000
		1920	70,000,000

Statistics for the years before 1904 are not available, but the quantities were small. These figures include all grades of benzol, including solvent naphtha. Before 1915 the solvent naphtha was probably one-third of the total, whereas since the war it is nearer 5 per cent. of the total.

During 1921 and 1922, approximately ninety per cent. of the quantity of light oil was produced as compared with the figures for 1920. Some of the larger companies found little difficulty in securing coal for their coke ovens during the shortage and, as a consequence, many have kept production up to 95 per cent. Many of the smaller plants, however, did have coal difficulties, and it is believed that their figures were lower. An average production of about 90 per cent. for benzol in 1921 and 1922 is a fair estimate.

ITEMS OF INTEREST.

British Coal Output.—The coal output from the mines of Great Britain for the week ended September 29 was 5,574,600 tons, compared with 5,504,300 tons in the preceding week, and 5,177,200 tons a year ago.

New Blast Furnace.—Messrs. Dorman, Long and Co. are putting into operation at their Port-Clarence (Co. Durham) iron works a new blast-furnace, which is the largest in the North-East. It will have a producing capacity of nearly 2500 tons per week.

New Zealand Coal Discovery.—An important coal development is reported seven miles from Greymouth, N.Z. A seam of good hard coal, 12ft. thick, has been struck in a bore at a depth of 900ft., proving its continuity over a very large area. The seam is now being worked.

Nigerian Tin Developments.—The Nigerian Tin Corporation advise shareholders of the successful conclusion of the negotiations for the acquisition of a mining lease on the Kuru area at Bukuru. The agreement was actually signed on September 26, and the property is now under the company's control.

Trade Inquiries.—The following inquiries have been received at the Department of Overseas Trade, 35, Old Queen Street, London, S.W. 1, where further information may be obtained on application: (*a*) Linseed oil; (*b*) machine oil; (*c*) anti-friction grease, all for South Africa. (Ref.: 12,290/E.D./C.C./2.)

Journal of Scientific Instruments.—The first regular monthly number of the *Journal of Scientific Instruments*, produced by the Institute of Physics with the co-operation of the National Physical Laboratory, will appear on October 15. The annual subscription is 30s. (to Corporate Members of the Institute 24s.).

French Congress of Industrial Chemistry.—The third congress is to be held by the French Society of Chemical Industry at Paris, from October 21-27. The main theme of the conference is "Agriculture," and among the experts invited to address the congress is Sir John Russell, who will speak on "The Relation of Soil Organisms and Soil Fertility."

Norwegian Sodium-Nitrite Production Costs.—According to estimates made by the U.S. Tariff Commission, the cost of producing sodium nitrite in Norway by the arc process is 262 kronen per short ton. Of this total 40 kronen is due to power, 130 kronen to soda ash, and 26.2 kronen to labour. At current rate of exchange the total production cost works out at about £11. per ton.

New Dyestuffs Research Director. — Professor W. H. Perkin has been appointed adviser to the headquarters research staff of the British Dyestuffs Corporation, Limited, in succession to Professor Arthur G. Green, who recently resigned. He is Waynflete Professor of Chemistry and a Fellow of Magdalen College, Oxford, where for some time he has been controller of the British Dyestuffs Corporation Research Colony.

Business Notices.—Sir Alan Hutchings (director of South Yorkshire Chemical Works, Ltd.), has joined the board of Benzol and By-Products, Ltd. Mr. J. A. Davy (vice-president of the Yorkshire Coke Owners' Association, and formerly president of the Coke-Oven Managers' Association) has been appointed general manager of the company's colliery and works.—It is announced that Sir Courtauld Thomson has been appointed chairman of the Limmer and Trinidad Lake Asphalt Company, Ltd. The Right Hon. Lord Southborough has joined the board.

Japanese Production of Agar-Agar. — The average annual production of agar-agar in Japan during the period 1911-1920 was approximately 3,000,000 pounds. During recent years the production has dropped somewhat. For the 1922-23 season the output was estimated at 2,400,000 pounds, states a U.S. Commerce Report. About 75 per cent. of the output is exported. Oriental countries, principally China and the Malay States, where agar-agar is used as a foodstuff, normally take over 60 per cent. of the exports. The remainder goes to the United States, Great Britain, France, and Germany. This year's shipments to Europe and America have been unusually large, amounting to 1,600,000 pounds by the end of April.

Unemployment Figures.—The number of persons on October 1, 1923, recorded on the live registers of the Employment Exchanges in Great Britain was 1,246,200. This was 14,163 more than in the preceding week, and 239,587 less than the figure recorded on January 1, 1923.

Chemical Industry Club.—The annual dinner of the Chemical Industry Club will take place at the Connaught Rooms on Friday, November 23. Tickets, 15s. each, may be obtained from members or from the Secretary, Mr. J. Arthur Williams, 2, Whitehall Court, London, S.W. 1.

The Scottish Oil Industry.—The Scottish Shale Miners' Association and the Scottish Oilworkers Association have received letters from Scottish Oils, Ltd., saying that, in view of the present state of the industry, they are compelled to intimate a reduction of shale miners' and oilworkers' wages.

Overseas Trade in September. — Preliminary returns of Overseas trade for September show that imports totalled £88,265,581. and British exports £63,836,144. Compared with the preceding month, these figures show a decrease in imports of five and a half millions and an increase in exports of nearly four millions.

Dyestuffs Development Committee. — The Board of Trade announce that Dr. A. T. de Mouilpied, of the British Dyestuffs Corporation, Ltd., has been appointed a member of the Dyestuffs Industry Development Committee, set up under the Dyestuffs (Import Regulation) Act, 1920, in the place of Dr. Herbert Levinstein, F.I.C., who has resigned.

Oil Refineries in U.S. Decreasing.—Reports to Bureau of Mines at Washington show that 41 oil refineries throughout the United States have been compelled to close since the beginning of the year. In January there were 301 plants in operation, and at the end of August only 260. Since the latter date a number of additional refineries have shut down.

Obituary. — It is with great regret that we record the death of John Allen Harker, F.R.S., D.Sc., O.B.E., on Wednesday, after a very short illness. Dr. Harker is best known by his war-time work on the organisation of the labours of the Nitrogen Products Committee of the Ministry of Munitions and as Director of the Research Laboratories set up to study modern nitrogen fixation processes. Further reference to Dr. Harker is made in our editorial columns.

British Gas Consumption Statistics.—Statements made at the annual conference of the British Commercial Gas Association at Birmingham show that the increase in the consumption of gas during the decade 1913-1922 was 60,000 million cubic feet as compared with 45,000 million cubic feet in the preceding ten years. The total sales of gas for the year 1922 were 265,000 million cubic feet, an increase as compared with the year 1917 of 33,000 million cubic feet.

Reported French Dye Combine. — An unofficial report from Paris states that "La Compagnie Nationale des Matieres Colorantes" has absorbed the "Etablissements Kuhlmann." (The latter company, which was established in 1825, and has a capital of 100,000,000 francs, manufactures not only dyestuffs, but pharmaceutical products, fertilisers, and many heavy chemicals.) It is also stated that the capital of the Kuhlmann firm is to be increased by 50,000,000 francs.

Deterioration of Structures in Sea Water.—The third interim Report of the Committee of the Institution of Civil Engineers has now been published, price 3s. net. The contents include the report on the investigations to protect timber against teredo; reports on the work carried out at the Marine Biological Laboratory, Plymouth; general report on the creosoting and impregnation of timbers; general report on the protection of iron and steel from corrosion by preservative coatings; report on the influence of strain upon the incorrodibility of iron and steel.

Arsenic in Food Preservative.—At Glasgow Sheriff Court on Tuesday a fine of £10. was imposed on the Midlothian Chemical Company, Ltd., for having, in premises in Dundas Street, sold a food preservative which contained 200 parts per million of arsenic, whereas it should not contain more than five parts per million. An agent who appeared on behalf of the respondents explained that they were not manufacturing chemists. The preservative was bought from a firm of manufacturing chemists in the city and the respondents had no knowledge of the presence of arsenic in it.

Mercury Production.—A statement issued by the management of the Almaden Mercury Mines is to the effect that the production of mercury during the first eight months of this year amounted to 23,585 bottles. Sales during this period totalled 35,988, leaving a stock on hand at September 1 of 16,545 bottles. The value of sales was 9,457,401 pesetas, representing an average price of 274.07 pesetas per bottle.

Dusts in Coal Mines. — Lieutenant-Colonel G. R. Lane-Fox, M.P., Secretary for Mines, announces that a memorandum has been prepared, and is now on sale, price 1s., for the Safety in Mines Research Board, recording the information at present available with regard to the application of incombustible dusts in coal mines as a precaution against coal-dust explosions.

Shoe and Leather Fair, 1923.—At the Shoe and Leather Fair, 1923, Necol Industrial Collodions, Ltd. (a "Nobel" concern), show on Stand No. 64-66, in the Gallery, a selection of their products, including Necol plastic wood, Necol enamel for split leather, Necol grain-leather finishes, varnish for light and fancy leathers, enamel for hat leathers, and waterproof cement for joining leather belting.

The Origin of Petroleum.—In a paper presented to the Institution of Petroleum Technologists on Tuesday night, Mr. E. H. Cunningham-Craig reviewed the theories of the genesis of petroleum. He concludes that as a result of the most recent work by Professor A. E. Flynn, of Nova Scotia, and others upon the gels separated from torbanites, the case for the origin of oil from vegetable matter has been fully established.

Tariff Notes.—Revised regulations dealing with the importation of sheep dips into South Africa have been issued, and are published in the Board of Trade *Journal*, October 4.—In the same issue appears a detailed list of chemicals and applied products which require an export licence on exportation from Germany.—An open general licence has been issued permitting the export from the United Kingdom of the following industrial explosives: Dynobel, Samsonite, Thames Powder, Sabulite No. 1, Super-Sabulite, Barwick, Hertford.

Dyestuffs Import Licences. — The Board of Trade *Journal* announces that applications for import licences under the Dyestuffs Regulations Act, 1920, during September numbered 457, of which 311 were from merchants or importers. To these should be added the 34 cases outstanding on September 1, making a total for the month of 491. These were dealt with as follows:—Granted, 342; referred to British makers of similar products, 79; referred to reparation supplies available, 30; outstanding on September 30, 1923, 40.

University News.—A graduation ceremonial was held on Friday last at St. Andrew's University, Principal Irvine, Vice-Chancellor, presiding, when the two recently appointed professors were installed in their respective chairs—Professor John Read, University of Sydney, to the Chair of Chemistry; and Professor Adam Patrick to the Chair Medicine.—The degree of D.Sc., *honoris causa*, has been conferred on Professor The Svedberg by the University of Wisconsin. Dr. Svedberg has been lecturing on colloid chemistry during the summer session of the University.—The Brown University of U.S.A. has awarded the degree of Doctor of Laws to Professor McBain, of Bristol University.

South Australian Minerals. — The adverse economic factors prevailing in the State of South Australia during 1922 were such that the mineral production in that year was the lowest in value since 1898. The value of the production was £331,514., against £902,549. in 1921. The production of gypsum during 1922, however, was the largest since this mineral was first obtained in the State, and it is further anticipated that the increase (in quantity from 34,383 to 45,241 tons, and in value from £29,427. to £37,650.) will be maintained by the further exploitation of the Penong deposits, which are shortly to be connected by rail to a port at Cape Thevenard. The largest individual contributor to the value of the total production was crude salt, the quantity and value being 48,657 tons and £109,478. respectively, but the former is less than the average of the last ten years, though the price has risen from 15s. per ton in 1913 to 45s. in 1922. The production of copper was 1,185 tons, a decrease of 347 tons, but the value fell from £106,370. to £73,646., a decrease of £32,724., the average price being £62. per ton in 1922, and £69. in 1921, against an average of £88. for the last ten years.

Bleaching with Percarbonates.—Amongst the products now frequently used in bleaching may be mentioned, hydrogen peroxide, sodium peroxide and sodium perborate. M. Bollis (*L'Avenir Textile*, June, 1923) now points out that sodium percarbonate, which has only been used hitherto on a very small scale, is worthy of more consideration as a bleaching agent. The product, the formula of which is $Na_2C_2O_6$, contains 120-130 grammes of active oxygen per kilogramme, is more stable than sodium peroxide, liberates its oxygen with perfect regularity, and does not necessitate the use of additional materials. Sodium percarbonate may be employed with all fabrics to the extent of about 1.5 to 2 per cent. on the weight of the fabric.

COMING EVENTS.

Society of Chemical Industry (South Wales Section).—Meeting, **Friday, October 12,** at **7.30 p.m.,** at the Technical College, Cathays Park, Cardiff. Discussion: "The Smoke Problem," to be opened by H. J. Bailey.

Institute of Metals (Sheffield Section).—Meeting, **Friday, October 12,** at **7.30 p.m.,** at the University, St. George's Square. Paper: "Electric Resistance Furnaces," by A. G. Lobley.—**(Swansea Section):** Meeting, **Friday, October 12,** at **7.15 p.m.,** at University College, Singleton Park. Chairman's address by E. E. Dendy.—**(Birmingham Section):** Meeting, **Tuesday, October 16,** at **7 p.m.,** at the Chamber of Commerce, New Street. Chairman's address by Dr. F. Johnson.—**(Scottish Section):** Meeting, **Friday, October 19,** at **7.30 p.m.,** at 39, Elmbank Crescent, Glasgow. Paper: "Large Metallic Crystals and Some of Their Properties," by Professor H. C. H. Carpenter.

Society of Dyers and Colourists (Manchester Junior Section).—Meeting, **Friday, October 12,** at **7.30 p.m.** Paper: "The British Colour Industry," by Dr. H. Levinstein.

Institution of the Rubber Industry (Manchester Section).—Meeting, **Monday, October 15,** at **7.30 p.m.,** at the Midland Hotel. Discussion: "Rubber Machinery," to be opened by H. C. Young.

Hull Chemical and Engineering Society.—Meeting, **Tuesday, October 16,** at **7.45 p.m.,** at the Photographic Society's Rooms, Grey Street. Paper: "Spinning Tops and Gyroscopic Motion," by L. C. Perkin.

Chemical Society.—Meeting, **Thursday, October 18,** at **8 p.m.,** at Burlington House, Piccadilly, London, W. 1. Paper: "The Catalytic Activation of Molecules and the Reaction of Ethylene and Bromine," by R. G. W. Norrish.

Institute of Chemistry.—Conference, **Thursday** to **Saturday, October 18** to **20,** at Liverpool. Thursday, reception and dinner; Friday, presidential address by A. Chaston Chapman, at 10 a.m.

Textile Institute.—Autumn Conference, **October 18** and **19,** at Leicester. The chief papers will be: "Artificial Silks," by P. E. King; and "The Application of Dyes to Fibres and Fabrics," by Professor J. Thorpe.

Society of Dyers and Colourists (Manchester Section).—Meeting, **Friday, October 19,** at **7 p.m.,** at 36, George Street. Paper: "Some Aspects of the Theory of Quinones," by Professor R. Robinson.

Society of Chemical Industry (South Wales Section).—Meeting, **Friday, October 19,** at **6.30 p.m.,** at Thomas's Café, Swansea. Joint meeting with South Wales Section of the Institute of Chemistry. Discussion: "Short Cuts in Analysis."

Institute of Physics. — Meeting, **Monday, October 22,** at the Institution of Electrical Engineers, Victoria Embankment, London, W.C. 2. Paper: "The Physicist in the Textile Industries," by Dr. A. E. Oxley.

Institute of Chemistry (Manchester Section).—Annual general meeting, **Wednesday, October 24,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage. Paper: "Some Aspects of Water-tight Cases," by S. E. Melling.—**(Glasgow Section):** Annual general meeting, **Thursday, October 25.**

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, October 26,** at **7 p.m.,** at 36, George Street.

British Association of Chemists.—Annual meeting, **Saturday, October 27,** at Birmingham.

REPORTS OF COMPANIES.

Dolcoath Mine, Ltd.

The statutory meeting was held at Camborne on Friday, October 5, Mr. Oliver Wethered (chairman) presiding. Mr. Wethered, in the course of his speech, said:—The outstanding feature of the statement sent to you is that it records the subscription by old shareholders and others of over £60,000.—£66,195. 5s., to be exact. Of this sum 1s. per share of the 5s. assessment has been paid, and the balance of 4s. per share, spread over a prolonged period, is owing by 1,240 subscribers, with an average remaining liability of less than £34., and without any large blocks of shares, so that the payment of the calls is assured. With the £65,000. guaranteed by the Government our financial position is materially better than we expected it to be when we last met you, and the managing director states that the cost of work so far is well within his estimate. Moreover, when the liquidation of the company is closed there will remain for future issue 139,370 shares yielding about £65,000. Summing up the capital position, we shall have no debenture and no preference shares, but only a liability for the £65,000. guaranteed by the Government, to be extinguished by annual payments over a period of years, and I may say that meanwhile we are not debarred from paying reasonable dividends. It is early days to talk of dividends, but it is well that you and the investing public should know that we have no old-man-of-the-sea on our shoulders, but a businesslike and equitable agreement.

DIVIDENDS.

Rio Tinto Company, Ltd.—Dividend out of the estimated profits of the year 1923 of 10s. per share, or 10 per cent., on the ordinary shares, payable on November 1, less tax. The interim dividend for 1922 was the same.

Alianza Nitrate Company, Ltd.—Interim dividend of 20 per cent. on account of profits for the current year. A similar dividend was declared a year ago.

Canada Cement Company. — Dividend of 1¾ dollars per share, less tax, on common shares, payable October 16. Last year, dividend same.

Glenboig Union Fire Clay Company, Ltd.—Net profit for year ended August 31, including £11,979. brought forward (less directors' and auditors' fees), amounts to £33,968., which the directors recommend should be disposed of by payment of a dividend at the rate of 20 per cent., less tax, carrying forward £10,155.

Forster's Glass Company, Ltd.—Profit for year to March 31 last, £2,287., reducing debit balance to be carried forward to £29,292.

Bryant and May, Ltd.—Interim dividend of 4 per cent., free of tax, on the ordinary and partnership shares for the half-year ended September 30, to be paid on November 1. The interim dividend for the preceding year was the same.

Canadian Explosives Company.—Dividend of 1¾ per cent. for the quarter ended September 30 on the seven per cent. preferred shares (the same as a year ago).

LEGAL INTELLIGENCE.

ANILINE DYE AND CHEMICAL COMPANY, LTD.

In the Lancashire Chancery Court at Manchester on Monday Vice-Chancellor Lawrence, K.C., had before him two summonses in the matter of the winding up of the Aniline Dye and Chemical Company, Ltd., Trafford Park, Manchester. It appeared that the liquidator, Mr. J. Todd, of Great Winchester Street, London, had entered the names of the executors of the late Earl of Shrewsbury and Talbot in respect of 89,500 £1. shares, and of Sir Henry Busby Bird in respect of 10,500 £1. shares as contributories. On the ground that the shares were fully paid up the Vice-Chancellor was asked to strike the names of the executors off the list of contributories. The 100,000 shares were purchased by Lord Shrewsbury and Sir Henry B. Bird as fully paid up, and were so allotted. In August, 1920, a Mr. Tinling, who had a controlling interest in what was known as the New Era Syndicate, approached the Earl of Shrewsbury and Sir Henry Bird, and proposed that they should lend £50,000. to complete the purchase of the Larne Salt and Alkali Company in Ireland. This property, it was proposed, would be transferred to the Aniline Dye and Chemical Company, which would pay for it by the issue of 136,000 fully paid up £1. shares. The nominal capital of this concern was £250,000., of which £114,000. had already been issued. The proposal was discussed in London, and the Earl of Shrewsbury expressed a desire to get the views of a stockbroker upon the matter. Another meeting was held, at which a stockbroken was present, and the result of the discussion was that Lord Shrewsbury said he would prefer to buy the shares rather than to lend money on the security of them. It was ultimately agreed that the Earl of Shrewsbury should find £45,000. and Sir H. B. Bird £5,000., and that they should buy 100,000 shares outright. It was also made a term of the arrangement that the Earl and Sir H. B. Bird should be made directors of the company.

At this point counsel consulted, and it was stated that terms of arrangement had been come to

Mr. Cunliffe said the liquidator considered that there was a case for investigation. The company's books had been examined, and he was satisfied that the names should be struck off the list of contributories.

The Vice-Chancellor: Then I will make an order to that effect.

No order was made as to costs.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

British Cellulose and Chemical Manufacturing Company, Ltd., London, S.W.—Registered September 20, mort. (supplemental to Trust Deed dated August 4, 1922, securing £500,000. 1st deb. stock).

Swithen Bleachworks, Ltd., Haigh (Yks.), chemical manufacturers.—Registered September 20, £400. 1st, £200. 2nd., and £200. 3rd debs. respectively, to Miss M. E. Wakefield, Mrs. R. M. Wakefield, and L. S. Wakefield, all of Church Lane, Thornhill, Dewsbury.

SATISFACTION.

Chadwicks (Manchester), Ltd., bleachers and finishers.—Satisfactions registered September 21, £1,000., part of amount registered June 5, 1912; and £500., registered March 11, 1913.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Concrete, Ltd., Leeds.—H. F. Holloway ceased to act as receiver September 20.

Price's Soap Company, Ltd.—Resolved September 3: That the company be voluntarily wound up; confirmed September 19. H. G. Rushton, Lever-ho., Blackfriars, London, E.C., liquidator.

Sapon Soaps, Ltd., London, E.C.—C. F. N. Gibbons ceased to act as receiver September 18.

Shaka Salt Company, Ltd.—Resolved September 19: That the company be voluntarily wound up. E. O. Mosley, 16, Bolton Street, Bury, liquidator.

Western Chemical Company, Ltd.—Resolved September 3: confirmed September 19: That the company be voluntarily wound up. W. Moore, 9, Clifford Street, New Bond Street, London, W., liquidator.

Western Chemical Company. — We are notified by the Western Chemical Company (Paisley), Ltd., Sandyford Works, Paisley, that they are in no way connected with the Western Chemical Company, Ltd., referred to under the "Gazette News" heading as being voluntarily wound up.

Manchester Literary and Philosophical Society.—At a meeting on Tuesday of the Manchester Literary and Philosophical Society, Professor H. B. Dixon, the president, gave an address dealing with coal-dust explosions at the Mines Department experimental station at Eskmeals. Before speaking on this subject, he said that he was glad to find the Council of the Society busily engaged on plans for the extension of the Society's headquarters. That the meeting-place of one of the oldest scientific societies—made ever memorable by its association with Dalton and Henry, Fairbairn and Joule, Roscoe and Schunck, Crawford Williamson and Osborne Reynolds—should be widened to meet modern conditions was not to be untrue to its past, but was the best means of maintaining the traditions and keeping green the memories it was their pride to cherish.

FERTILISER NEWS.

Nitrate of Soda.—Shipments from Chile during September amounted to 139,000 tons, of which 92,000 tons are due for Europe (including Egypt), 32,000 tons for the United States, and 15,000 tons to other countries. With the production for the month estimated at 160,000 to 165,000 tons, the stocks on the coast are increasing, and at September 30 last stood at approximately 960,000 tons, which compares very favourably with 1,495,000 tons twelve months ago. Shipments to Europe are still very much below pre-war figures, and this fact is emphasised by the quantity loading at October 1—viz., 36,000 tons, against 170,000 tons at the same date in 1913. The world stocks, which have been steadily increasing since May, as is natural during the off-season, now reach 1,448,000 tons. The spurt in buying which took place in the early part of September has been mainly responsible for the lack of interest shown during the latter half of last month and the opening portion of October. Since the announcement of prices for the current season, it is estimated that sales made by the Association for delivery over the present nitrate year amount to about 1,280,000 tons. To be added to this quantity, however, is the nitrate carried over from last year in the form of unshipped sales at June 30, amounting to 140,000 tons, and about 90,000 tons sold by producers not belonging to the Association. It is anticipated by the Producers' Association also that a further 800,000 tons will yet be required, bringing the total sales for delivery over the coming fertiliser year up to 2,300,000 tons. Of the actual sales so far made, amounting to 1,510,000 tons, some 770,000 tons are due to Europe, 600,000 tons to America, and the balance to Japan and other countries. All the new official business will be at the arranged price of 21s. per quintal, all the cheaper first-hand material having been purchased. According to the schedule of prices issued, nitrate for delivery over the second half of next June was fixed at 19s. 3d. per quintal, but in response to inquiry for material delivered over that period it was stated that no commitments were authorised for delivery later than April. It appears, therefore, as if the trust is adopting a cautious attitude, seeking to maintain high prices and short production rather than face the problems involved in a definite move towards larger output. A semi-official message stating that the possibility of a reduction in prices had been discussed at a meeting of producers in Valparaiso recently has met with a widely broadcasted denial from the London Nitrate Committee. The official denial not only contradicts the assumption that prices may be lowered, but that they may be altered at all. It seems clear from this, therefore, that the Producers' Association do not anticipate such a demand as cannot be met by the present rate of production, or out of existing stocks.

Sulphate of Ammonia.—The home demand for this fertiliser is still quiescent, in spite of the moderate price increases recorded in this column last week. One is tempted to think that, with the present tendency in this country to restrict expenditure in farming to the lowest possible limit, even to the point of neglecting fertilisers, it would have been better to have left prices alone. Even working by a prearranged schedule, as the Federation have stated they are doing, the fact that fertiliser prices are still going up, while receipts from the sale of agricultural produce are becoming smaller and smaller, tends to influence the farmer to an extent out of all proportion to the actual infinitesimal increase in price. With the present export demand, of course, the Federation do not need to go to extreme lengths to encourage the domestic consumer; but the fact remains that the British export of by-product ammonium sulphate will have to face very strong competition from the United States, and eventually from the synthetic nitrogenous fertilisers. This being so, it seems as if the Federation might have foregone the strict adherence to a schedule in an effort to persuade farmers to use more sulphate. Be that as it may, it is well to take note that inquiry from abroad is quietening off a little, and it is possible that exports during September, which represent orders over previous months, will be lower. If it were not for the import duty of about £1. or more per ton, it would be possible at the present low prices to import British sulphate into the United States, where the demand exceeds the supply, and prices are higher than the British material would be, even when delivered in America. A report from the other side of the Atlantic states that some Canadian resale material was, indeed, available at a price which would have allowed a profit after payment of import duty. It will be remembered that quite recently German manufacturers of nitrogenous fertilisers decided to abandon paper-currency quotations for their products. Instead of quoting marks per unit, the price of rye was taken as the basis of values; but owing, doubtless, to considerable difficulty in adjusting prices in the various districts, a more stable system has been found in what veritably amounts to quoting in foreign currency. The price for internal consumption, therefore, has been fixed on a gold-mark standard, sulphate of ammonia standing at 1.05 gold marks per unit of nitrogen per 100 kilogrammes. Payment can be made, it is stated, alternatively in securities of the gold loan, or in paper marks on the basis of the dollar exchange.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

The outstanding feature of the position is that while the number of furnaces in blast in the hematite pig-iron producing district between Workington and Carnforth is only fourteen, nearly all the iron that is being smelted is the ordinary iron, for which the local coke is suitable. In West Cumberland scarcely any low-phosphorus iron is being made, and in the Furness district the proportion is not one-third. Another furnace has now been put into operation, and there is every prospect that in January there may be three or four additional furnaces blowing. An improvement in the steel trade as well as in the iron trade will be chiefly accountable for the expansion of production at the furnaces, the outlook as regards activity at the rail mills at Barrow and Workington early next year being quite healthy, and it may be seen, therefore, that the coal and coking industries are likely to have an exceedingly busy winter. At the present time both industries are easily disposing of their production. All the nuts and smalls are wanted for the coking plants, which are very busy. Some part of the make of coke is going to the Furness district, which is receiving, in addition, over 8,000 tons of East Coast coke weekly. The largest proportion is being absorbed by the furnaces in West Cumberland. Smelters are paying from 29s. to 33s. per ton, according to carbon content. What is going to the Continent commands from 34s. to 37s. per ton, f.o.b. Residuals are a fairly satisfactory trade. The tar is being taken by the local chemical works, and the make of crude benzol and sulphate of ammonia is moving away quite briskly.

SOUTH WALES NOTES.

[Specially Contributed.]

There are signs of further improvement in the tinplate trade, and inquiries have greatly improved. Though manufacturers are anxious to book for delivery, merchants are still reluctant to enter into any large volume of business, the feeling among buyers being that prices will be easier. The merging of Richard Thomas and Co., Ltd. and the Grovesend Steel and Tinplate Co., Ltd. is considered as of great importance as the total assets are in the neighbourhood of £12,000,000. It is reported that other amalgamations also are proceeding in the tinplate industry. The patent-fuel business is of a steady description, the chief export markets just now being British West Indies, Algeria, France, Italy, Spain and Egypt. There have been very heavy movements in oils during the week, the importation of the National Oil Refineries amounting to some 20 million gallons of crude petroleum. There is more activity in cokes, exports having expanded. A conference was held at Cardiff on Saturday last between the owners and employees of the by-product plants, to consider the latter's application for wage increases. An agreement was reached whereby the men are to receive an increase of 5 per cent. as from the 1st inst. to the end of the year when the situation will be reviewed.

Among the imports to Cardiff were 1,674cwt. liquid glucose from New York, 7 sulphur burners from New York for Messrs. F. W. Berk and Co., Ltd., 438cwt. phosphorus from Montreal, and 11 tons ferro silicon from Gothenburg; to Swansea 199 tons copper ore from Pomaron, 17cwt. chemical sheet lead from Antwerp, and 11 tons plumbago from Genoa; to Newport 20 tons ferro alloys from Antwerp. Among the exports were 23 tons mineral pitch-asphalt and 5 tons chloride of lime to Hennebont, 9 tons zinc ashes to Havre from Newport.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

September 24 to 29 (inclusive).

Charcoal. Bloxam, A. G. (*Akt.-Ges. für Anilin-Fabrikation*). 23,965.
Working Quartz. British Thomson-Houston Co., Ltd. (*General Electric Co.*). 23,956.
Purifying or Softening Water. Crosfield & Sons, Ltd., J.; Hilditch, T. P.; and Wheaton, H. J. 23,838.
Arseno-benzene Derivatives. Farbwerke vorm. Meister, Lucius, and Brüning. 24,306.
Diaminodiaryldialkylmethanes. Farbwerke vorm. Meister, Lucius, and Brüning. 24,307.
Cement. Girouard, Sir E. P. C. 24,222.
Compound for Detection, Oxidation, or Combustion of Inflammable Gases. Gumbley, J. P. 24,228.
Refining Metals. Harris, H. 24,029.
Dyeings on Fibre. Johnson, J. Y. (*Badische Anilin- and Soda-Fabrik*). 24,121.
Sulphur Furnace. Metallbank-und Metallurgische Ges. 24,023.
Effecting Transfer of Heat Between Liquids and Gases. Miller, T. F. 24,149.
Synthetic Ammonia. Norsk Hydro-Elektrisk Kvælstofaktieselskab. 23,950.
Sterilising Organic Substances. Quain, J. R. 23,921.
Filters. Shaw, H. S. Hele-. 23,936.
Closure of Cylinders for Compressed Gases. Soc. Anon. d'Applications des Gaz Liquéfiés. 24,077.
Kneading and Crushing Machines. Thomson, Ltd., D. 23,821.
Acid Phosphate Salts Soluble in Water. Williams, J. G. 24,166.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. *in stamps to the Comptroller, Patent Office Sales Branch,* 25, *Southampton Buildings, Chancery Lane, W.C.* 2.

SAFRST BELT RIGS
As used by Tens of Thousands of Chemic, Gas, and other workmen.

THE HOLDEMRITE BELT RIG is a Light, Strong, Cheap, but EXACTLY SAFE tool for ensuring safety to men who value their lives by using Safety Tackle.
Adopt these rigs and get rebate from Insurance Companies.
Note.—6 times *as many men are injured* by falling *as are gassed at chemic and gas works.*

No matter how a man slips his fall is prevented (figs. S1, S2, S3) or he is arrested right - safe.

A gassed man is easily carried, dragged, or hoisted (fig. 55) vertically to safety. 90% of stress is on the legs.

Supplied by A. HANLEY, 42, Thirlmere Road, SHEFFIELD.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Facilitating Chemical Reactions. J. W. Spensley and Chemical Engineering Company (Manchester), Ltd., Manchester. British Patent, **201,968,** of 1922.

Chemical reactions that are usually brought about only by long heating, agitation, or both, are effected rapidly and at lower temperature by intimately mixing the interacting substances, with or without others, by passing them through a high-speed centrifugal pin disc mill of the horizontal disc type, in which a continuous stream of the substances is introduced at the centre and the mixture is discharged substantially all round the circumference. The mill preferred is that described in Specification 186,462. Examples are given of the production of hard soap, soft soap, dry soap powder, resin size, lubricants, disinfectants, caustic soda, and vulcanising compositions and accelerators for the vulcanisation of rubber, and the purification of edible oils by the removal of free fatty acids. Reference has been directed by the Comptroller to Specification 186,462.

Filtering Media. H. Bechold, Frankfurt-on-Main, Germany. British Patent, **202,143,** of 1922.

In order to secure a sterile filtrate, materials such as diatomaceous earth, cellulose, clay, sand, gravel, and coke, used for filtering water, fruit juices, serum, toxins, and other liquids, are impregnated with metals having a lower solution tension than hydrogen or compounds of such metals which are not readily soluble. In the case of metals, two are used together, and the metals are of higher solution tension than platinum or one is of higher solution tension than platinum and the other of lower solution tension than silver. Suitable substances include copper, copper oxide, copper ferrocyanide, copper carbonate, silver, silver oxide, silver sulphocyanate, silver chloride, silver chromate, mercury, mercuric oxide, mercurous chloride, bismuth, bismuth trioxide and pentoxide, arsenic, antimony, and antimony oxide. Amalgams or alloys may be used. The impregnating materials may be deposited in the filtering mass by chemical action therein, or introduced in a gaseous state. Auxiliary substances which will serve to maintain a uniform distribution of the active material may be used. In one example, filtering-material is impregnated with silver chloride by first introducing gaseous ammonium chloride and then a solution of silver nitrate. In a second example, the filtering material is treated successively with solution of tannin or albumen, mercuric chloride, and caustic soda, the material being thus impregnated with mercury or mercuric oxide. In a third example, filtering material is impregnated with copper by treating it with a solution of copper sulphate mixed with cane sugar or dextrin, and then drying and heating.

Purifying Gases. J. G. Taplay, London; and W. L. Galbraith, Westminster. British Patent, **202,024,** of 1922.

Gases are freed from hydrocyanic acid with the production of ammonium sulphocyanide by treating the gas in the presence of sulphuretted hydrogen, ammonia, and water with calcium, barium, or strontium bicarbonate. The gas, which must be free from tar, may be passed through a solution of the bicarbonate, such as calcium bicarbonate, or may be brought into contact with the solid carbonate in presence of water and carbon dioxide, which, if not already present, are added to the gas. The ammonium sulphocyanide is washed off the surface of the solid carbonate from time to time—*e.g.*, by a spray of water.

Bituminous Emulsions. H. A. Mackay, London. British Patent, **202,021,** of 1922.

Aqueous emulsions of bitumen of the kind artificially prepared from petroleum (*e.g.*, Mexican asphalt), are prepared by melting the bitumen and adding thereto, with agitation, first about 2½-5 per cent. of a higher fatty acid, and then a dilute (1-2 per cent.) solution of potassium or sodium hydroxide or carbonate at a temperature of 215-225° F., the heating and agitation being maintained until emulsification takes place. Preferably the agitation is continued during cooling. Unsaturated acids, such as oleic acid or the acids from linseed oil or marine oil, may be used. The emulsions may be used for coating or impregnating stone, wood, metal, felt, and other materials, or as a binding-agent in road-making. Specifications 28178/10, 202,230, and 202,231 are referred to.

Lignone Sulphonic Acids. C. F. Cross, London; and A. Engelstad, Vardol, Norway. British Patent, **202,016,** of 1922.

Wood and like lignified materials are resolved by treatment at 100-110° C. with a strong aqueous solution of sulphurous acid substantially free from sulphuric acid. In an example, wood prepared as for the bisulphite process is treated with six times its weight of a seven per cent. solution of sulphurous acid purified from sulphuric acid. The mass is heated with open steam for six hours; then steam at a temperature of 105-110° C. is employed for a further ten hours to complete the resolution. The liquor containing the lignone derivatives may be evaporated to dryness, preferably under reduced pressure, or prepared in concentrated form for transport. These derivatives are stated to be different from those contained in sulphite-cellulose liquor.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Catalytic Materials. C. Urfer, Geneva. British Patent, **199,027.** Convention date, June 12, 1922.

A metal, its hydride or nitride, is obtained in a finely divided state by first preparing the amalgam of the metal and then heating it *in vacuo*, hydrogen or nitrogen respectively. The metals specifically referred to are alkaline earth metals, lithium, chromium, manganese and cerium. The powdered products serve as catalytic materials, particularly for the synthesis of ammonia, in which case it is stated that the synthesis can be effected without the use of pressure or at low pressures and at relatively low temperatures. According to the example, chromium amalgam is prepared by electrolysis and then distilled either *in vacuo* to obtain powdered chromium or in nitrogen to obtain the nitride.

Soaps. T. Legradi, Vienna (Assignee of I. Wieninger, Munich, Germany.) British Patent, **202,263.** Convention date, August 8.

Dehydrated hard soaps are obtained by prolonged heating of the entire mass obtained when fat is saponified with caustic liquor in presence of excess of fat or of unsaponifiable organic or mineral fat-like matter. Suitable matters specified are paraffin oil, vaseline, wool-fat, fats and fatty acids such as stearine, oleine from wool fat, waxes such as beeswax, and paraffin, ceresin, montan, or japan wax. Hard soaps of large resin or potash content may thus be obtained. In an example, 40kilos. of hard fat soap made from hardened train or fish oil, 40kilos. of palm-kernel oil fatty acids, 20kilos. of paraffin wax, and the necessary caustic potash liquor of 50 per cent strength are heated with stirring until no more water vapour escapes. The mass is then moulded and compressed.

Active Charcoal. Farbwerke vorm. Meister, Lucius and Brüning, Hoechst-on-Main, Germany. British Patent, **200,889.** Convention date, July 15, 1922.

Active charcoal is obtained by heating, in presence of an acid of phosphorus, carbonaceous material such as wood, turf, straw, brown coal, or a mixture of these materials, in a revolving furnace, internally heated by combustion gases. The entry of air or excess of oxygen into the combustion gases may be permitted; the presence of oxygen in the gases leaving the furnace is advantageous.

Active Charcoal. Farbwerke vorm. Meister, Lucius, and Brüning, Hoechst-on-Main, Germany. British Patent, **201,163.** Convention date, July 22, 1922.

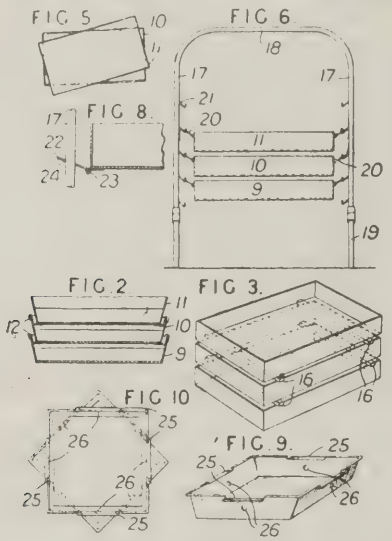
Active charcoal, of a practical hardness and not too voluminous, is made from peat or lignite by mixing it with finely divided wood and carbonising, with or without impregnation by a chemical reagent. In an example peat is ground and mixed with sawdust and the mixture soaked with a solution of phosphoric acid. It is then compressed in moulds and carbonised, for instance, in a revolving kiln.

Aldehyde Motor-spirit Mixtures. H. Terrisse, Geneva. British Patent, **202,264.** Convention date, August 12.

Motor spirit is obtained by adding acetal, paraldehyde, or both, with or without acetaldehyde, to alcohol, to refined petroleum alone or with petrol, to the 80-340° C. fraction distilled from tar from coal, schiste, lignite, peat, or wood, or to other hydrocarbons. Examples include the use of 60 parts of alcohol or petroleum with 40 parts of paraldehyde, and of 65vols. of coal-tar distillate with 20vols. of paraldehyde, 13vols. of acetal, and 2vols. of acetaldehyde

Sulphur Burning. Texas Gulf Sulphur Company, Inc., Manhattan, New York, U.S.A. (Assignees of W. H. Kobbé, Manhattan, New York, U.S.A.) British Patent, **202,283.** Convention date, August 8, 1922.

The burning of sulphur, particularly sulphur containing organic impurities such as oil, is effected by distributing the sulphur in superposed layers near enough for the heat of combustion of one layer to be largely transmitted to an adjacent layer or layers. The apparatus described comprises superposed trays or receptacles, which are suitably spaced apart and may be arranged in a furnace structure or in a casing, or may be used unenclosed, as for fumigating. Trays 9, 10, 11, Fig. 2, may be stacked by means of hooks



12 supported upon the edges of the lower trays, or by rods 16, Fig. 3, or by handles 20 engaging hooks 21 upon a frame 17, 18, 19, Fig. 6, or by sheet-metal gripping members 22, Fig. 8, which are hinged at 23 to the trays and have holes 24 somewhat larger than the frame side 17, so as to grip the frame while being readily adjustable and allowing the trays to be placed in contact if it is desired to extinguish the combustion. Or the trays may be stacked upon one another in staggered angular relation, as shown in Fig. 5, in which case the sides may be cut away as at 25, Fig. 9, to allow of secure stacking as shown in Fig. 10. In such a case the sides are provided with holes 26, which allow of feeding the whole stack from the uppermost tray, the molten sulphur flowing through the holes 26 to the lower trays in succession.

Vulcanising Indiarubber. Naugatuck Chemical Company, Naugatuck, Connecticut, U.S.A. (Assignees of S. M. Cadwell, Leonia, New Jersey, and O. H. Smith, New York.) British Patent, **200,789.** Convention date, July 13, 1922.

In the process for accelerated vulcanisation which consists in incorporating with indiarubber, etc., or with latex a metal in combination, an amine, a material comprising sulphur, and a material comprising carbon disulphide or oxysulphide, one or more of the ingredients is or are introduced into the rubber by diffusion, either in liquid or gaseous state or in solution in an organic solvent such as benzol, carbon tetrachloride, gasoline, or chloroform. Sulphur may be used in the free state or in a compound from which it is transferred to the rubber under vulcanising conditions. For hot vulcanisation it may be replaced by certain nitro compounds. Suitable amines and derivatives of carbon disulphide and oxysulphide are those mentioned in Specification 177,493. Compounds containing more than one of the vulcanising ingredients may be used—*e.g.*, oxynormalbutylthiocarbonic acid disulphide (carbon disulphide and sulphur), tetramethylthiurammonosulphide (carbon disulphide and amine), and zinc butyl xanthogenate (zinc and carbon disulphide). The Specification contains several examples.

NEW COMPANIES.

Milton Proprietary, Ltd. — Capital £200,000., £1. shares (100,000 10 per cent. cumulative participating preference). Manufacturers of and dealers in chemicals and disinfectants, etc. Office: 125, Bunhill Row, London, E.C. 1.

Anglo-American Cattle Products Company, Ltd.—Private company. Capital £10,000. Cattle products merchants, dripping and edible fat manufacturers, etc. Office: 5, Castle Street, Liverpool

British Ferro-Silicate Tar Macadam and Concrete Company, Ltd.—Private company. Capital £5,000. Office: 5, Quay Parade, Swansea.

Edmund Martin, Ltd. — Private company. Capital £15,000. Manufacturers of and dealers in all kinds of animal lubricants, etc. Office: 167, Caledonian Road, London, N.

Geo. H. Brass and Co., Ltd.—Private company. Capital £2,000. Raw fat refiners, soap, oil, and size merchants, etc. Office: Acklam Street, Middlesbrough.

Jane Hambling, Ltd.—Private company. Capital £2,000. Manufacturing chemists. Office: 14, New Bond Street, London, W.

Japan All Producers, Ltd. — Private company. Capital £1,000. Manufacturers of and dealers in varnish at 34, Swinnow, Bramley, Leeds.

Lustrafil, Ltd. — Private company. Capital £30,000. Makers of artificial silk, etc. Office: Valley Mills, Nelson, Lancs.

Sotyr Institute, Ltd.—Private company. Capital £2,000. Manufacturers of and dealers in certain secret compounds and medicinal preparations. Office: 175, Northumberland Park, Tottenham, N. 17.

Spectrum, Ltd.—Private company. Capital £5,000., in 4,975 10 per cent. non-cumulative preference shares of £1. and 500 deferred preference of 1s. each. Manufacturers, importers, and exporters of and dealers in dyestuffs, etc. Office: 30, City Road, London, E.C.

T. H. Newsome and Co., Ltd.—Private company. Capital £15,000., £1. shares (6,000 6 per cent. cumulative preference). Grease manufacturers and oil merchants. Office: 34, Dewsbury Road, Leeds.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," October 13, 1888.)

Electrically Refined Sugar.—The report has been published of a meeting of the shareholders of the Electric Sugar Refining Company, held at Liverpool, to meet Mr. Roberts, on his return from a visit paid to America, in order to be present at demonstrations of actual work there. It will be seen from the report of the proceedings at these demonstrations that the spectators were only allowed to congregate on the lower floor, and witness there the delivery into barrels of sugar conveyed by spouts from an upper floor. They were not allowed to inspect the machinery nor any of the manufacturing processes whatever, so that although we see no reason to doubt that sugar really fell into barrels in their presence, there is absolutely no proof that this sugar was produced by any electrical process. It is stated that "when steam was turned on they heard the deep rumble of machinery on the two upper floors," and that this "deep rumble" was followed by a "shower," increasing to a "pouring volume," of sugar; but, even if this statement be true, we fail to discern that the "deep rumble of machinery" in a distant apartment proves the electrical refining of the sugar which fell. Indeed, to our minds, there is a smack of theatrical artificial thunder and unreality about the whole affair, and it would not be surprising if subsequent events prove commercial electrical refining to be a myth, only devised by some clever Yankee, to successfully extract gold from British purses.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals. — A few changes have taken place during the week in values, but generally the market keeps up well, despite the prolonged slowness of business. The position on the Continent tends to harden the spot position, in consequence of the uncertainty of supplies and the dearer rates now coming to hand from Germany. The German crisis does not, however, affect this market so much as the pharmaceutical section. One of the chief movements during the past week has been the continual fall in the price of spot formaldehyde, but this item is likely to be much steadier at the new rates. **Acetic Acid,** 80% technical, £47.; 80% pure, about £49.; 98% glacial, £60. in casks and £72. to £73. in glass demijohns, ex wharf London; the spot position is steadier after last week's slightly easier tone, and business has been satisfactory. **Acetone,** British Government specification about £125. per ton in drums; inquiry continues for spot supplies which are steady at the rates quoted. **Alum,** lump, in casks, £10. to £10. 10s. per ton; dealers continue to offer at these prices, but are not finding much business. **Arsenic,** Cornish, white powdered, on spot, about £60. to £61. per ton; foreign material offering at about level rates; inquiry has been good from America, but little business has been done so far in that direction. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. to 1s. 5½d. per lb.; dealers' quoted prices are a shade firmer this week, and some little business has been booked. **Bleaching Powder,** 35—37%, on spot, £10. to £10. 10s. per ton; offers from the Continent, f.o.b., are at about £9. per ton; there has been little moving of late. **Barium Chloride,** 98—100%, about £15. per ton; moderate business transacted at about this figure. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27. per ton; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers quote at these unchanged rates for home trade only; their prices for export vary according to destination; dealers are quoting under similar conditions for home trade at—commercial, granulated £23. 10s., and powdered at £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers' prices, for home trade only, packages free, carriage paid in Great Britain, are unchanged. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; dealers are offering at competitive prices. **Cream of Tartar,** 99—100%, about 88s. per cwt., less 2½%; this price is being fairly well maintained, and some little business has been done. **Citric Acid,** B.P., crystals, about 1s. 5d. per lb., less 5%; the spot market remains very dull and exceptionally weak; hardly any inquiry for stocks offering. **Epsom Salts,** commercial quality, about £4. 10s. per ton, in bags; dealers offering at this rate, with not much inquiry on hand. **Formaldehyde,** 40%, about £65. per ton; a further material reduction in spot prices is recorded, and the position is not very steady; business has been fair. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers are offering at slightly easier prices, with not much business materialising. **Lead Acetate,** brown, about £41.; white, about £42. per ton; spot supplies appear to be short, and the position is firm, and may advance. **Litharge,** about £35. 10s. per ton; dealers continue to offer at about this figure, with occasional business being done. **Lithopone,** 30% Continental red seal, £22. 10s. to £23. per ton; this market is a little firmer this week at the improved rates quoted. **Ammonium Chloride,** grey galvanisers', £30. 10s. to £31. per ton; the spot position is steady and unchanged, with business limited. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers' prices are unchanged. **Oxalic Acid,** about 5¾d. to 6d. per lb.; the tone here is just a shade easier, with the market still quiet. **Carbonate of Potash,** 90—92%, £26. to £27.; 96—98%, about £29. per ton; dealers' prices remain about the same, with inquiry slow. **Chlorate of Potash,** crystals and granular, about 2¾d. per lb.; dealers' prices quoted; business very small. **Caustic Potash,** 88—92% solid, about £31. per ton; spot prices hold firm, although there has been little business doing; Continental position is also firm. **Permanganate of Potash,** commercial quality, about 9d. per lb.; dealers' prices are somewhat easier this week, with business dull. **Prussiate of Potash,** yellow, about 1s. per lb.; dealers are quoting very steadily at this price, but are not doing any good business. **Sulphate of Potash,** 90%, £11. per ton, ex ship; a reduction in price is notified. **Mercury,** about £10. per bottle of 75—76lb., net; the spot position keeps fairly steady at about this figure. **Red Lead,** imported, about £35. 10s. per ton; dealers are doing a fair business at about this figure. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white, £25. to £26. per ton; spot supplies are restricted, and, with the position on the Continent firmer, dealers' prices are fully maintained. **Saltcake,** ground and unground, home trade, about £4. 10s. per ton; export, about £5. 5s. per ton, f.o.b.; prices are steady, with good inquiry on the market. **Acetate of Soda,** about £24. to £24. 10s. per ton; some spot supplies are available, with prices steady and inquiry small. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers' prices show no change; business is only occasional and small. British makers' prices for home consumers on contract are at: 70—72%, £17. 17s. 6d.; and 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers' price, for home trade only, carriage paid in Great Britain, is unchanged. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags, carriage paid in Great Britain; British makers quoting at this figure for home trade only. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers' quotation is unchanged at this figure. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers quoting at these figures. **Hyposulphite of Soda,** pea crystals, about £14. to £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £9. per ton, in casks; dealers' prices are level on the week, with business slow. **Nitrate of Soda,** 96%, about £13. 5s. per ton, f.o.r. or f.o.b.; this market keeps steady at this rate. **Nitrite of Soda,** 100%, about £26. 10s. per ton; at this rate the market keeps quite steady. **Prussiate of Soda,** about 6d. per lb.; dealers continue to quote at this price, but business is not at all brisk. **Sodium Sulphide,** 60—62% solid, about £14.; ditto, broken, about £15. 5s. per ton, in drums; 60—65% concentrated, £14. per ton, in casks; dealers have been doing very little business here. **Sulphate of Copper,** £25. 5s. to £25. 10s. per ton; the market appears to be fairly easy and dull at these rates. **Tin Crystals,** about 1s. 4d. per lb.; no change to record. **Tartaric Acid,** B.P. crystals, on spot, 1s. 1½d. per lb., less 5%; supplies freely offered, with hardly any demand; the position is very weak. **White Lead,** imported, about £42. per ton; dealers are doing a limited business at unchanged prices. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers report no change in their quotations.

Pharmaceutical Chemicals.—Owing to a general stiffening of prices on the Continent, and to the uncertainty of further supplies from Germany, the spot position in many items is firmer this week. Business has been moderately good, but the volume continues rather limited. **Acetanilid,** crystals and powder, 1s. 9d. to 1s. 10d. per lb.; some spot holders have advanced their quoted rates; the market tends to move in this direction. **Acetyl-Salicylic Acid,** B.P., 3s. 1d. to 3s. 2d. per lb.; this market is firmer, with spot supplies limited; inquiry has been good. **Benzoic Acid,** B.P., 2s. 3d. to 2s. 6d. per lb.; inquiry remains small, with quoted rates unchanged.

Diethylbarbituric Acid, B.P. (barbitone), 17s. 6d. to 18s. per lb.; higher rates are being quoted on spot, but the demand is slow. **Salicylic Acid**, B.P., 2s. 3d. to 2s. 4d. per lb.; at these rates the position is very steady, with inquiry quite good. **Tannic Acid**, leviss, 3s. 3d. to 3s. 6d. per lb.; spot supplies are offered at about these prices, with not much business doing. **Amidopyrin**, about 14s. 3d. to 14s. 6d. per lb.; this market has remained dull, with no change in quoted values. **Ammonium Bromide**, about 6¾d. to 7d. per lb.; spot business has been slow, and prices are about the same. **Benzonaphthol**, about 5s. per lb., nominal; no business reported. **Betanaphthol**, resublimed, 1s. 10d. to 2s. per lb.; this market is dull, and rather weak. **Benzaldehyde 03**, about 3s. per lb.; quoted prices are steady on a quiet market. **Calcium Lactate**, 1s. 9d. per lb.; at this price the market is fully maintained, with moderate business about. **Chloral Hydrate**, duty paid, about 4s. per lb.; spot parcels are available at or just under this rate. **Creosote Carbonate**, about 8s. 3d. per lb.; there is no improvement in demand, and quoted rates are unaltered. **Creosote**, B.P., about 2s. 6d. per lb.; at this price the market is rather easy and dull. **Guaiacol Carbonate**, about 9s. 9d. to 10s. per lb.; spot prices have advanced, and the market is firm. **Hexamine**, 3s. 11d. to 4s. per lb.; spot quotations are much firmer this week, owing to scarcity of offers and higher rates from the Continent. **Hydroquinone**, about 3s. 6d. per lb.; there is not much inquiry on spot, and dealers' prices are rather unsteady. **Methyl Salicylate**, 2s. 8½d. to 2s. 9d. per lb.; a further advance in prices quoted by spot holders is recorded, with the market firm. **Methyl Sulphonal**, about 15s. per lb.; there is still but little inquiry for this material, with prices on spot unaltered. **Paraformaldehyde**, 3s. 6d. to 3s. 9d. per lb.; the market is somewhat firmer this week. **Paraldehyde**, 1s. 5d. to 1s. 6d. per lb.; these rates are better maintained, owing to advances on the Continent. **Phenacetin**, 6s. 2d. to 6s. 3d. per lb.; dealers are quoting at about these levels, but something in the way of an advance is looked for. **Phenazone**, 7s. 6d. to 7s. 9d. per lb.; spot rates have hardened during the week, and may go still higher. **Phenolphthalein**, 6s. 6d. to 6s. 9d. per lb.; this market holds quite steady. **Potassium Bromide**, B.P., crystals and granular, 6¼d. to 6½d. per lb.; at these rates the spot position is fairly steady, but business is still slow. **Potassium Permanganate**, B.P., about 9½d. per lb.; at this price the spot market holds up well, and fair business is being done. **Potassium Sulphoguaiacolate**, about 5s. 6d. per lb.; quoted rates show no change, with inquiry poor. **Resorcin**, 5s. 6d. to 5s. 9d. per lb.; there are some little signs of a firmer tone here. **Sodium Bromide**, B.P., crystals and granular, 7¼d. to 8d. per lb.; dealers are offering at about these prices, but there is not much doing. **Sodium Salicylate**, powder, about 2s. 6d. per lb.; crystals, about 2s. 8d. per lb.; higher prices are being asked by dealers; Continental offers are scarce and dearer. **Sulphonal**, about 14s. 6d. per lb.; hardly any inquiry about, and quoted rates are unchanged **Terpin Hydrate**, about 1s. 9d. per lb.; spot values show no change, and market steady. **Thymol**, about 15s. per lb.; business remains dull, with prices quoted unaltered.

Coal-tar Products, Intermediates, Etc. — Pitch continues to harden in price, and is becoming more active. Other products show no material change, and the demand generally has been on the small and slow side. **Aniline Oil**, about 9d. to 9¼d. per lb., drums free; the position is level on the week, with the market slow. **Aniline Salt**, 9½d. to 10d. per lb., casks free; inquiry is poor, and quoted rates are unchanged. **Betanaphthol**, 1s. 1d. to 1s. 2d. per lb.; dealers are doing just a few small orders at about these figures. **Benzol**, about 1s. 3¾d. to 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; the market is decidedly dull, and prices are not firm. **Toluol**, 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; quoted rates show no change on the week, with business dull. **Xylol**, pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; this market shows little life, and quoted rates are unaltered. **Naphtha**, about 1s. 4d. per gallon; at the price quoted the position is weak, with business dull. **Solvent Naphtha**, 90/160, 1s. 3d. per gallon, drums extra; inquiry remains poor, with no further reduction in price recorded. **Heavy Solvent Naphtha**, 90/190, 1s. 3d. per gallon, drums extra; the market remains flat, with prices rather easy. **Burning Oils**, crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; quoted rates show no change on the week. **Special Oil**, for Diesels and motors, 10d. per gallon, barrels free; quotations are at the old level, with business quiet. **Creosote Oil**, about 9½d. per gallon, f.o.b.; dealers seem rather unsteady at about this rate when quoting for the little business on the market. **Carbolic Acid**, crystals, about 1s. 2d. per lb., f.o.b.; the position keeps firm at this level. **Naphthalene**, about £19. 10s. to £20. per ton; the spot position is a little improved this week, with offers from the Continent advancing; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; candles, £28.; tablets, £28. per ton, packages free. **Disinfectants**, 3s. 9d. per gallon, barrels free; dealers continue to quote at this old rate. **Pyridine**, about 21s. per gallon; with spot supplies short, the tone keeps firm at this high rate. **Hexamethylene**, about 3s. 9d. per gallon; a further slight advance is recorded in importers' quoted rates; business has been slow, but there has been a fair volume of inquiry. **Pure Methyl Alcohol**, about £90. per ton, in drums, ex wharf London; dealers' prices are steadily maintained in this region, with occasional business passing. **Pitch**, about 137s. 6d. per ton, f.o.b. East Coast; during the week inquiry and business in forward positions has been quite active, and prices have steadily appreciated, finishing the week quite firm, and showing every tendency to further advances.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £59. 17s. 6d. to £60., cash; £60. 12s. 6d. to £60. 15s., three months; electrolytic, £63. 10s. to £64. 10s. **Tin**: Standard, £203. 5s. to £203. 10s., cash; £199. 10s. to £200., three months; Straits, £204. 10s.; English, £204. 5s. **Lead**, soft foreign, £26. 7s. 6d., prompt; English, £27. 10s.; chemical sheet, 36s. 6d. per cwt. for 2-ton lots, delivered. **Spelter**, prompt, £32. 5s.; hard, £26. 10s. **Antimony**, English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34. 10s. to £35. **Aluminium**, 98—99%, £115.; foreign, £100., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 5s. **Bismuth**, 10s. **Platinum**, 500s. per oz. **Wolfram**, spot, 12s. 3d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

Business generally has been rather dull again during the past week, but values as a whole are unaltered. For alkali products current quotations are steady at recent rates, and makers fairly well engaged with orders. **Bleaching Powder** is dull at £11. 5s., soft woods, on rails works. **Glauber's Salt** lower at 70s. per ton, carriage paid. **Saltcake**, steady at £4. 10s., carriage paid, but inquiry is only small. **Chlorates** are easy at 3d. for **Potash** and 2¾d. for **Soda**. **Bichromates** are unchanged. American rock **Sulphur**, firm at £5. 5s. on rails. **Copper Sulphate** slow of sale, and price nominal at £25. 10s. to £26., f.o.b. **Phosphate of Soda**, easy at £15.; **Commercial Hyposulphite of Soda**, £9. 10s.; and **Concentrated Sulphide**, £14. per ton; **Nitrite**, firm at £26. 10s., ex store. White powdered **Arsenic**, steady at £61., on rails Cornish works. **Yellow Prussiate** is quiet at 1s. to 1s. 0½d. per lb.; **Soda**, 5½d. to 5¾d. per lb. **Carbonate of Potash**, 88—90%, is lower at £24.; but solid **Caustic**, 88—90%, maintained at £29., ex store. Grey and brown **Acetate of Lime** continue scarce, and values high. **Acetic Acid** and **Acetate of Soda** are firm in sympathy. **Acetone**, dull at £126. Miscible **Wood Naphtha**, 6s. 3d. per gallon. **Barium Chloride**, quiet at £15. per ton. **Lead Salts** are firm: White **Acetate** £41., brown £45.; **Nitrate**, £42, delivered. **Formaldehyde**, 40%, £65. per ton. **Formic Acid**, 85%, £51. per ton, ex store. **Oxalic Acid**, in small request at 5¾d. per lb. **Permanganate of Potash**, B.P., 9½d. per lb.

SWANSEA MARKET REPORT. Wednesday.

Tinplate prices continued on the fixed basis of £1. 3s. 1½d. per standard box, with business more active. **Galvanised Sheets** remained firm at £19. 2s. 6d. per ton, f.o.b. **Copper** in less inquiry and on the easy side, with prompt at £61. 12s. 6d. per ton, and three months £62. 2s. 6d. **Tin** not so active, with irregular quotations; for prompt £204. 12s. 6d. per ton, and three months £202. 12s. 6d. **Lead** rather firm on good offers at £26. 3s. 9d. per ton prompt, and

£25. 17s. 6d. forward for soft; English, £27. 15s. **Spelter,** rather easier tendency, with consuming demand not strong; prompt £32. 12s. 6d. per ton, and forward £32. 15s. **Zinc Sheets,** £39. 7s. 6d. per ton, f.o.r. at makers' works. **Sulphate of Ammonia** firm at late quotations. **Sulphate of Copper,** dull at £26. 2s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda,** steady at 13s. 6d. per cwt. **Bone Meal,** steady at £9. 2s. 6d. per ton for prompt Indian. **Pitch** prices were easier at £5. 18s. 6d. per ton for best qualities, at docks. **Oxalic Acid,** rather dull at 6¼d. per lb. on rail. **Arsenic** quiet, with easier quotations at £62. 2s. 6d. per ton for white powdered. **Copperas,** inactive at £2. 2s. 6d. per ton, including delivery London or equal. **Sulphuric Acid,** in fair demand at unchanged rates. **Benzol,** 1s. 4d. per gallon at works. **Linseed Oil** firm: raw £2. 6s. 9d., and boiled £2. 8s. 9d. per cwt. **Cottonseed Oil** in good demand, with common edible at £2. 3s. 3d., and deodorised £2. 6s. 3d. per cwt. **Coconut Oil** very steady, with Ceylon at £2. 4s. 9d. per cwt. **Olive Oil** quiet; Spanish, prompt, £66. 17s. 6d. per ton. **Turpentine** dearer; American, prompt, £3. 16s. 9d. per cwt. **Palm Oil** quietly steady; Lagos, £36. 10s. 6d., softs £36. 5s. 3d., mediums £36. 10s. 6d., and hards £37. **Coals** in better supply, and for immediate clearance concessions were offered: Best Admiralty smokeless £1. 7s. 6d., seconds £1. 6s. 6d.; ordinaries, £1. 5s. 6d. per ton, all f.o.b. **Anthracite,** fairly active: Best large £2. 7s. 6d., seconds £1. 17s. 6d.; Paris nuts, £3. per ton, all f.o.b. **Patent Fuel** was quiet, and is firmly held from £1. 9s. to £1. 12s. per ton, f.o.b. **Cokes** in strong demand, and firm; export, £2. 2s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Business in the heavier chemicals continues steady, with a very fair movement in the home-trade branch; in the export branch orders have come to hand more freely, and shipments have been on a larger scale. **Bleaching Powder** has been in fair demand; the price for use in the United Kingdom is £10. 5s. to £10. 7s. 6d. per ton, and for export £11. 5s. to £11. 7s. 6d. per ton. **Chloride of Calcium** has been steadily called for, and is £5. 12s. 6d. per ton. **Caustic Soda** has again been in good request for use by the home trade, and has had a more active shipment for foreign ports; it is £19. to £20. per ton for 76%, carriage paid in the U.K. **Bicarbonate of Soda** continues in very fair demand for use by the home trade, and is £10. 10s. per ton, carriage paid, for such use; shipments on foreign account have been more active. **Soda Crystals** have been in rather good request for use in the U.K., and are £5. 5s. per ton, carriage paid, for the home trade. **Nitrate of Soda** has had a very limited inquiry for home-trade use, and is £13. 5s. to £13. 10s. per ton. **Borax** has been in very fair demand; commercial crystals are £25. per ton, and powdered £26.; higher grade crystals are £29. per ton, and powdered £30.; superfine is £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** has again had a fairly free sale, and is £4. 10s. to £5. per ton for home-trade use, and £5. to £6. per ton for export. **Bichromate of Soda** has had a fair and steady sale, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has sold with some freedom for use in the U.K., and has been shipped very freely for foreign ports; it is £7. 10s. per ton for the home trade, in bags, f.o.r. at works; and £8. per ton for export, this price varying somewhat according to destination. **Hyposulphite of Soda** has had a very fair inquiry; it is £10. to £11. per ton, in 2cwt. bags, for commercial, and £15. to £17. per ton for the photographic quality, in 1cwt. kegs. **Sulphide of Soda** has been in moderate demand; solid is £14. 10s. to £15. per ton, and crystals £8. 15s. to £9. per ton. **Chlorate of Soda** has been quiet, and is 3d. to 3¼d. per lb. **Phosphate of Soda** has been neglected, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been but little called for, and is 6½d. per lb. **Yellow Prussiate of Potash** has been in quietly steady demand, and is 1s. 1d. per lb. **Red Prussiate** has been rather more in request, and is 3s. per lb. **Carbonate of Potash** has moved but slowly, and is £29. to £30. per ton. **Nitrate of Potash** continues to sell steadily, and is £29. to £30. per ton. **Chlorate of Potash** has had a small sale, and is 3½d. to 4d. per lb. **Caustic Potash** has had a fair inquiry, and is £29. to £30. per ton. **Permanganate of Potash** continues to sell rather freely and is 9½d. to 9⅝d. per lb. **Bichromate of Potash** has again been in very fair request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been more in demand; first quality is £60. per ton, and second quality £57. per ton. **Sulphate of Ammonia** has been but little in demand for home-trade use, but has had a heavy shipment to foreign ports; neutral of 25¾% is £14. 12s. 6d. per ton, and ordinary of 25¼% £13. 9s. 6d. per ton for home-trade use, for October deliveries; for November, 2s. 6d. per ton more than the prices given is quoted. **Carbonate of Ammonia** has been in rather good request, and is 4d. per lb. **Muriate of Ammonia** has had a moderate inquiry; grey is £32. per ton. **Magnesia** has sold with some freedom: **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has had a very limited sale; it is £12. per ton for use in the U.K., and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been rather more in request, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has had a steady and very fair inquiry; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s., and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has had a rather slow sale, and is 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has had a very fair inquiry; it is £4. 10s. per cwt. **Boric Acid** has been steadily called for; commercial is £48. per ton, and powdered £51. per ton; B.P. grades are £54. to £60. per ton. **Citric Acid** has moved but slowly, and is 1s. 6d. to 1s. 7d. per lb. **Oxalic Acid** has been quieter, and is 6d. per lb. **White Acetate of Lead** has been but little in demand, and is £42. to £42. 10s. per ton. **Sulphate of Copper** has had a moderate inquiry for use in the U.K., but has been very quiet in the export branch of the trade; it is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been rather more in request, with a somewhat lower price; from £60. to £62. per ton is now being quoted for white powdered.

WEST OF SCOTLAND CHEMICALS. Wednesday.

Inquiry during the week has continued fair, and the home trade is, if anything, a shade better. Export inquiry, however, is small and of a limited character. Prices are steady, with arsenic reduced to a level at which some business has been done. Barium chloride is also easier. Lead acetate, brown, is in better inquiry, and the spot price has moved up slightly. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, lower at £66. 10s. per ton on spot; a steady market. **Barium Chloride,** £14. 10s. per ton; at this reduced price the market remains steady. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this reduced figure. **Citric Acid,** 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate,** £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar,** £4. 3s. 6d. per cwt. for 99% at Glasgow; quotation shaded, but inquiry small. **Lead Acetate,** white £41. 10s. per ton on spot; brown, more inquiry at £43. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this lower figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** lower at 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. 2d. per lb.; at this price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 12s. per cwt., net; a better market, with quotation unaltered. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; rather easier in tone, and inclined to be dull. **Tartaric Acid,** 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

GLASGOW.

Week ending October 6.

BARYTES—
Antwerp, 250 bgs.
Bremen, 10 cks.

BORAX—
Wilmington, 700 bgs.

BORON MINERAL—
Wilmington, 414 bgs.

CARBON BLACK—
Gothenburg, 10 cks.

CASEIN—
Nantes, 50 bgs.

CHEMICALS (*otherwise undescribed*)
Hamburg, 288 pkgs.

CHROME ORE—
Beira, 1,000 t.

CREAM OF TARTAR—
Bordeaux, 124 brls.

GELATINE—
Bremen, 5 cs.

GLUE—
Antwerp, 22 bls.

MANGANESE ORE—
Colombo, 5,000 t.

PARAFFIN WAX—
Philadelphia, 150 brls.

SALT—
Bremen, 920 bgs.; Hamburg, qty.

SILICON METAL—
Baltimore, 48 kgs.

SOAP—
Antwerp, 2 cs.
Philadelphia, 14 brls.

SODIUM ACETATE—
Antwerp, 36 cks.

SODIUM SULPHIDE—
Antwerp, 39 drms.

TANNING MATERIALS—
Myrabolans
Calcutta, 578 pkts.
Wattle
Mombasa, 1,098 bgs.

WHITE LEAD—
Bremen, 21 cks.

ZINC OXIDE—
Antwerp, 20 brls.

GOOLE.

Week ending October 6.

BARYTES—
Antwerp, 100 bgs.

CALCIUM CARBIDE—
Antwerp, 50 drms.

DEXTRINE—
Amsterdam, 50 bgs.

Hamburg, 6 kgs.

GLUE, SIZE, AND GELATINE—
Allepey, 7 cks.; Batavia, 20 bgs.; Boston, 10 cks., 280 bgs.; Buenos Ayres, 40 pkgs.; Calcutta, 24 pkgs.; Colombo, 10 pkgs.; Durban, 15 pkgs.; East London, 50 pkgs.; Ferrol, 3 pkgs.; Habana, 30 pkgs.; Karachi, 10 pkgs.; Montreal, 8 c.; New York, 10 bxs.; Samarang, 20 bgs; Santiago de Cuba, 10 bgs.; Shanghai, 30 cks.

LEAD ORE—
Lagos, 15 c.

LITHOPONE—
Montreal, 2 t.; Rangoon, 2 cs.

MANGANESE ORE—
Baltimore, 318 t.

PARAFFIN WAX—
Barranquilla, 50 sks.

ROSIN OIL—
Singapore, 6 brls.

SALT—
Abonema, 40 t.; Accra, 9 t.; Antwerp, 200 t.; Amsterdam, 30 t.; Auckland, 30 t.; Belize, 22 t.; Brisbane, 1 t.; Duala, 25 t.; Durban, 20 t.; Ghent, 100 t.; Grand Lahou, 25 t.; Lagos, 295 t.; Helsingfors, 100 t.; Iddo, 900 t.; Lyttleton, 59 t.; Monte Video, 3 t.; Montreal, 395 t.; Melbourne, 25 t.; New York, 150 t.; Puerto Barrios, 25 t. 6 c.; Pt. Harcourt, 57 t.; Rio de Janeiro, 4 t.; Sekondi, 20 t.; Shanghai, 1 t.; Sierra Leone, 110 t.; Sourabaya, 4 t.; Stockholm, 800 t.; Sundsvall, 50 t.; Vejle, 10 t.; Wellington, 70 t.; Winnebah, 13 t.

SOAP—
Accra, 504 pkgs.; Alexandria, 486 pkgs.; Alicante, 5 pkgs.; Alleppey, 10 pkgs.; Antwerp, 50 pkgs.; Amboina, 35 pkgs.; Amsterdam, 120 pkgs.; Antigua, 19 pkgs.; Auckland, 349 pkgs.; Bangkok, 103 pkgs.; Barbados, 331 pkgs.; Barcelona, 4 pkgs.; Batavia, 100 cs.; Belize, 282 pkgs.; Beira, 315 pkgs.; Belawan, 135 pkgs.; Bombay, 3,769 pkgs.; Bermuda, 241 pkgs.; Bourgas, 20 pkgs.; Buenos Ayres, 210 pkgs.; Calcutta, 961 bxs.; Callao, 104 pkgs.; Calicut, 100 pkgs.; Cape Palmas, 27 pkgs.; Christchurch, 5 pkgs.; Cochin, 290 pkgs.; Colombo, 529 pkgs.; Colon, 344 pkgs.; Commodoro Rivadavia, 60 pkgs.; Corinto, 49 pkgs.; Curacao, 250 pkgs.; Durban, 119 pkgs.; Dunedin, 160 pkgs.; Grenada, 30 pkgs.; Gibraltar, 150 pkgs.; Hong Kong, 4 cs.; Hsin-Ho-Whauf, 35 pkgs.; Iddo, 210 bxs.; Invercargill, 160 bxs.; Iquitos, 1,621 bxs.; Karachi, 995 pkgs.; Kingston (Ja.), 667 bxs.; Kobe, 12 cs.; Lagos, 598 bxs.; Las Palmas, 539 bxs.; Langsa, 50 bxs.; Lho Seumaweb, 50 bxs.; Lome, 30 bxs.; Macassar, 505 pkgs.; Madras, 422 pkgs.; Malacca, 420 bxs.; Malta, 35 pkgs.; Mangalore, 4 bxs.; Menado, 565 bxs.; Matadi, 11 pkgs.; Mauritius, 3,705 pkgs.; Montego Bay, 30 pkgs.; Montserrat, 13 pkgs.; Melbourne, 1 cs.; Monrovia, 70 pkgs.; Mossamedes, 1 cs.; Nassau, 7 bxs.; Olehleh, 50 pkgs.; Padang, 155 pkgs.; Palembang, 3 cs.; Panama, 519 bxs.; Para, 5 cs.; Para (for Bolivia), 12 cs.; Penang, 105 cs.; Puerto Cortez, 2 cs.; Pt. Harcourt, 606 cs.; Pt. Louis, 20 cs.; Pt. Said, 156 pkgs.; Pt. Stanley, 1 cs.; Pt. Swettenham, 61 cs.; Punta Arenas, 3 cs.; Rangoon, 1,075 bxs., 1,953 cs.; Rio de Janeiro, 1 bx.; Rotterdam, 504 cs.; Sabang, 50 cs.; San Fernando, 261 bxs.; Shanghai, 1,532 pkgs.; Samarang, 250 cs.; Segli, 50 cs.; Sekondi, 7 cs.; Singapore, 3,402 pkgs.; Sierra Leone, 13 pkgs.; Sourabaya, 861 pkgs.; St. Johns (N.F.), 64 cs.; St. Kitts, 14 bxs.; St. Lucia, 39 bxs.; Sydney, 14 pkgs.; Tandjong Balei, 500 bxs.; Taihope, 15 pkgs.; Tampico, 1 pkg.; Teneriffe, 135 pkgs.; Timaru, 9 pkgs.; Trinidad, 1,464 pkgs.; Tientsin, 151 pkgs.; Vancouver, 5 pkgs.; Varna, 290 pkgs.; Vera Cruz, 2 pkgs.; Victoria (W.C.A.), 20 pkgs.; Wanganui, 160 pkgs.; Wellington, 10 pkgs.; Winnebah, 175 pkgs.

SODA ASH—
Algoa Bay, 209 pkgs.; Auckland, 38 pkgs., 100 bgs.; Batavia, 100 bgs.; Bluff, 55 kgs.

SODA ASH—
Blumenthal, 1,600 bgs.; Bolivia, 70 brls.; Bombay, 1,000 bgs.; Brisbane, 59 bgs.; Buenos Ayres, 166 pkgs.; Delagoa Bay, 500 pkgs.; Dunedin, 170 pkgs.; Durban, 500 bgs.; Gothenburg, 50 bgs.; Kingston (Ja.), 22 pkgs.; Kobe, 8,331 pkgs.; Melbourne, 236 pkgs., 59 bgs.; Moji, 4,004 bgs.; Monte Video, 250 cs., 50 pkgs.; Newcastle, 118 bgs.; Norrkoping, 50 pkgs.; Pelotas, 37 cks.; Rangoon, 2,000 pkgs.; Rio Grande do Sul, 20 cks.; Rio de Janeiro, 10 pkgs.; Rotterdam, 1,400 bgs.; Sekondi, 20 kgs. Shanghai, 6,832 bgs.; Stockholm, 250 bgs.; Suva, 20 cks.; Sydney, 488 cks., 477 bgs.; Vancouver, 100 pkgs.; Volo, 40 bgs.; Yokohama, 5,140 bgs.

SODA CRYSTALS—
Colombo, 100 pkgs.; Karachi, 50 pkgs.; Kingston (Ja.), 20 pkgs.; Pernambuco, 160 kgs.; Pt. Said, 51 pkgs.

SODIUM BICARBONATE—
Adelaide, 275 pkgs.; Auckland, 231 pkgs.; Bluff, 120 kgs., 27 pkgs.; Bombay, 1,600 pkgs.; Bourgas, 110 kgs.; Brisbane, 40 drms.; Calcutta, 1,850 pkgs.; Colombo, 320 pkgs.; Dunedin, 64 pkgs.; Durban, 50 pkgs.; Karachi, 800 pkgs.; Kobe, 646 pkgs.; Limassol, 60 kgs.; Launceston, 24 pkgs.; Lyttleton, 187 pkgs.; Melbourne, 40 pkgs., 7 kgs.; Norrkoping, 20 kgs.; Pernambuco, 75 pkgs.; Rio Grande do Sul, 20 pkgs.; Piraeus, 10 pkgs.; Puerto Barrios, 20 kgs.; Rangoon, 950 pkgs.; Shanghai, 493 pkgs.; Santos, 438 pkgs.; Stockholm, 20 kgs.; Sydney, 195 kgs., 134 pkgs.; Vera Cruz, 700 pkgs.; Wellington, 50 bgs.

SODIUM BISULPHITE—
Pt. Swettenham, 150 drms.
Singapore, 100 drms.

SODIUM FLUORIDE—
Sydney, 5 cks.

SODIUM HYDROSULPHITE—
Auckland, 40 kgs.
Sydney, 20 kgs.

SODIUM HYPOSULPHITE—
Lyttleton, 40 pkgs.

SODIUM SILICATE—
Adelaide, 103 pkgs.; Bombay, 13 pkgs.; Buenos Ayres, 54 drms.; Dunedin, 7 pkgs.; Fremantle, 57 pkgs.; Genoa, 250 pkgs.; Gothenburg, 17 pkgs.; Lyttleton, 32 pkgs.; Madras, 40 pkgs.; Melbourne, 581 pkgs.; Monte Video, 14 pkgs.; Rangoon, 15 pkgs.; Rio Grande do Sul, 12 drms.; Shanghai, 30 cs.; Sydney, 38 cks., 29 bgs.

SODIUM SULPHATE—
Monte Video, 3 cks.

SODIUM SULPHIDE—
Calicut, 50 drms.; Genoa, 88 drms.; Rio de Janeiro, 82 drms.; Sekondi, 103 drms.; Sydney, 41 drms.

STEARINE—
Helsingfors, 30 pkgs.

TALLOW—
Antwerp, 28 pkgs.; Danzig, 44 brls.; Helsingfors, 30 brls.; Rotterdam, 120 brls.; Singapore, 46 drms.

LONDON.

OFFICIAL AMENDMENT.

Deduct from Return for week ending June 27, 1923.

CARBONATE OF AMMONIA—
Kobe, 5 t., £154.

Week ending October 3.

ACETANILID—
Brisbane, 2 cs. (pt.), £7.

ACETIC ACID—
Adelaide, 2 cs., £6.; Beira, 18 cs., £31.; East London, 1 cs., £8.; Sekondi, 4 cs., £7.; Wellington, 5 cs., £18.

ACETONE—
Calcutta, 10 drms., £70.
Pt. Elizabeth (F.), 4 drms., £49.

ACETYL SALICYLIC ACID—
Brisbane, 2 cs. (pt.), £33.
Melbourne, 1 cs., £18.
Montreal, 3 cs. (pt.), £55.
Shanghai, 2 cs. (pt.), £8.

ALUM—
Pt. Elizabeth, 5 kgs., £5.

ALUMINIUM SULPHATE—
Jamaica, 8 kgs., £5.

AMMONIA—
Accra, 5 cs., £12.; Antwerp, 20 cks., £100.; Basra, 5 cs., £8.; Bermuda, 8 cs., £15.; Bombay, 8 cs., £14.; Calcutta, 12 cs., £43.; Cape Town, 9 cs., £16.; Colombo, 4 cs., £7.; Delagoa Bay, 3 cs., £5.; Demerara, 4 cs., £7.; Durban, 17 cs. (pt.), £33.; Gibraltar, 6 cs., £10.; Hong Kong, 4 cs., £10.; Karachi, 5 cs., £9.; Kilindini, 3 cs., £5.; Madras, 17 cs., £30.; Monte Video, 5 cs., £4.; Penang, 8 cs., £14.; Pt. Sudan, 3 cs., £6.

AMMONIA (ANHYDROUS)—
Iddo, 6 cylds., £285.; Santos, 3 cs., £31.; Sarawak, 1 cyld., £8.; Trinidad, 1 cyld., £7.

AMMONIUM BENZOATE—
Melbourne, 1 cs. (pt.), £36.

AMMONIUM BROMIDE—
Calcutta, 2 cks., £11.; East London (F.), 1 cs., £6.; Melbourne, 1 ck., £5.; Sydney, 1 ck., £7.

AMMONIUM CARBONATE—
Antwerp, 1 t., £33.; Bombay, 5 c., £23.; Calcutta, 3 c., £22.; Durban, 15 c., £27.; Hamburg, 1 t. £23.; Hong Kong, 10 c., £31.; Madras, 1 c., £6.; Melbourne, 1 t. 8 c., £46.; Paris, 2 t. 9 c., £71.; Pernambuco, 1 t., £40.; Pt. Elizabeth, 4 c., £8.; Santos, 3 c., £10.

AMMONIUM IODIDE—
Melbourne, 1 cs., £14.

AMMONIUM NITRATE—
Adelaide, 2 cs., £7.; Antwerp, 30 t., £780.; Bilbao, 25 t., £650.; Rouen, 20 t., £200.

AMMONIUM SULPHATE—
Amsterdam, 97 t. 5 c., £1,264.; Belewan Deli, 830 t., £12,243.; Cologne, 100 t., £1,425.; Demerara, 20 t., £293.; Jamaica, 102 t. 5 c., £1,475.; Kobe, 449 t. 14 c., £7,558.; Mauritius, 200 t., £3,400.

ANTIMONY SULPHIDE—
Brussels, 2 cks., £32.
Ghent, 4 cks., £44.
Kobe, 67 cks., £528.
New York, 7 cks., £138.
Santos, 25 cks., £33.

ARSENIC—
Colombo (F.), 3 drms., £28.
Santos, 120 drms., £533.

ARSENIC SULPHIDE—
New York, 10 kgs., £56.

ARSENIOUS ACID—
East London, 1 cs., £7.

BARIUM NITRATE—
Santos, 10 cks., £19.

BARIUM PEROXIDE—
Montreal, 21 drms., £373.

BARIUM SULPHATE—
Melbourne, 1 ck., £9.

BENZOIC ACID—
New York, 1 cs., £48.

BISMUTH—
Melbourne, 2 cs., £143.

BISMUTH CARBONATE—
Auckland, 1 cs. (pt.), £36.; Calcutta, 5 cs. (pt.), £20.; Durban, 3 cs. (pt.), £56.; New Plymouth, 1 cs., £13.; Santos, 1 cs. (pt.), £9.

BISMUTH SALTS (*otherwise undes.*)
Calcutaa, 1 cs., £50.

BISMUTH SUBNITRATE—
Calcutta, 5 cs. (pt.), 1 ck. (pt.), £25.
Melbourne, 1 cs., £60.

BISMUTH SUBNITRATE—
Santos, 1 cs. (pt.), £18.

BITUMEN—
Rangoon, 70 cks., £171.
Sydney, 18 cks., £40.

BLEACHING POWDER—
Singapore, 1 cs., £5.

BONE MEAL—
Beira, 4 t. 13 c., £47.
Channel Islands, 5 t., £40.

BORAX—
Buenos Ayres, 15 c., £20.; Durban, 3 c., £6.; Kolmar (F.), 1 t., £26.; Malmo (F.), 1 t., £26.; Shanghai, 3 c., £7.; Victoria (B.C.), 3 c., £8.

BORIC ACID—
Bangalore, 2 c., £5.; Calcutta, 10 c., £38.; Colombo, 2 c., £7.; East London, 3 c., £12.; Hankow, 2 c., £7.; Melbourne, 1 c., £11.; New Plymouth, 5 c., £14.; Panama, 1 c., £5.; Pt. Sudan, 2 c., £7.; Wellington, 4 c., £26.

BROMINE—
Melbourne, 1 cs., £12.

CADMIUM IODIDE—
Melbourne, 1 cs. (pt.), £6.

CALCIUM CARBIDE—
Bermuda, 1 t., £16.; Cape Town, 2 c., £6.; Channel Islands (F.). 10 c., £9.; Colombo (F.), 10 c., £8.; Iddo, 12 c., £49.; Madras, 7 c., £14.; Mombasa, 15 c., £25.

CALCIUM CHLORIDE—
Calcutta, 1 cs. (pt.), £14.
East London, 3 cs., £7.

CALCIUM ACETYL SALICYLATE
Melbourne, 1 cs. (pt.), £6.

CARBON BISULPHIDE—
Pt. Elizabeth, 3 cs., £8.
Pt. Said, 7 drms., £17.

CARBON TETRACHLORIDE—
Shanghai, 5 cks., £14.

CAUSTIC POTASH—
Melbourne (F.), 1 cs., £11.

CAUSTIC SODA—
Jamaica, 4 c., £7.
New Plymouth, 3 c., £6.
Timaru, 4 c., £6.

CHEMICALS (*otherwise undescribed*)
Adelaide, 3 pkgs. (pt.), £108.; Alicante, 40 pkgs., £100.; Amoy, 17 cs. (pt.), £16.; Antwerp, 8 pkgs., £27.; Switzerland (*via* Antwerp), 70 pkgs., £179.; Switzerland (*via* Antwerp) (F.), 35 pkgs., £103.; Auckland, 6 cs., £21.; Beira, 3 cs., £5.; Bombay, 5 pkgs. (F.), £13.; Bombay, 12 pkgs. (pt.), £26.; Brisbane, 13 pkgs., £228.; Calcutta, 22 pkgs. (pt.), £75.; Callao, 20 pkgs. £60.; Canterbury, 3 kgs., £15.; Cape Town (F.), 20 pkgs., £96.; Cape Town, 19 pkgs., £70.; Constanza, 348 pkgs., £600.; Dar-es-Salaam, 16 cs. (pt.), £5.; Demerara (F.), 2 pkgs., £7.; Demerara, 1 cs., £10.; Durban, 14 pkgs. (pt.), £38.; East London, 20 cs., £5.; Italy (*via* Ghent), 2 cs. (pt.), £18.; Gijon, 40 pkgs., £51.; Gothenburg, 50 pkgs. (F.), £240.; Hankow, 7 cs. (pt.), £9.; Iddo, 5 pkgs., £5.; Jamaica, 11 kgs., £7.; Kilindini, 11 cs., £34.; Madras, 10 cs. (pt.), £48.; Malta, 20 cs., £13.; Mauritius, 1 cs. (pt.), £19.; Melbourne, 89 pkgs. (pt.), £1,312.; Montreal, 6 cs. (pt.), £146.; Mossel Bay, 4 pkgs., £25.; New Plymouth (F.), 4 pkgs. (pt.), £6.; New Plymouth, 3 pkgs. (pt.), £8.; Ostend, 3 bgs., £20.; Panama, 3 cs., £8.; Penang (F.), 1 cs., £25.; Perth, 5 cs. (pt.), £9.; Pt. Elizabeth, 6 pkgs., £9.; Pt. Swettenham, 1 cs., £9.; Rangoon, 7 cs., £10.; Rockhampton, 50 pkgs., £77.; Salaverry, 10 pkgs., £30.; Santander, 1 cs., £8.; Santos, 6 pkgs. (pt.), £22.; Shanghai, 15 cs. (pt.), £273.; Singapore, 25 pkgs., £8.; Stockholm (F.), 10 pkgs., £50.; Sydney, 8 cs. (pt.), £357.; Vera Cruz, 100 cs., £355.; Wellington, 9 pkgs. (pt.), £46.; Winnipeg, 5 cs. (pt.), £22.; Zanzibar, 2 cs. (pt.), £15.

CHROME ALUM—
Hamburg, 80 kgs., £90.
Riga, 5 cks., £22.

CITRIC ACID—
Adelaide, 5 c., £42.; Auckland, 2 c., £17.; Barbados, 1 c., £8.; Bombay, 2 c., £21.; Brisbane, 2 t., £332.; Calcutta, 2 c., £26.; Cartagena, 5 c., £42.; Durban. 13 c., £111.; Fremantle, 10 c., £83.; Jamaica, 1 c., £8.; Melbourne, 1 t., £166.; Pt. Elizabeth, 2 c., £15.; Sourabaya, 1 c., £5.; Sydney, 2 t., £332.; Tarragona, 10 c., £83.

COAL TAR PRODUCTS—
Benzol
Pt. Elizabeth, 40 drms., £49.
Carbolic Acid
Cape Town, 1 cs. (pt.), £5.; Karachi, 1 cs., £6.; Santos, 1 ck., £6.; Sydney, 3 cks., £17.
Creosote
Adelaide, 200 drms., £164.; Amsterdam, 58 cks., £221.; Galveston (bulk), 320,836 galls., £13,668.
Naphtha
Cape Town, 20 drms., £31.
Naphthalene
Antwerp, 1,168 bgs., £1,430.
Santos, 2 cs., £6.
Pitch
Aviles, 1,500 t., £8,625.; Dunkirk, 277 t., £1,835.; France, 390 t., £2,535.; Pt. Sudan, 10 brls., £21.; Rochefort, 1,150 t., £7,315.
Pyridine
Cape Town, 20 drms., £94.
Tar
Dominica, 4 brls., £9.; Durban, 257 pkgs., £52.; East London, 290 drms., £34.; Pt. Elizabeth, 55 brls., £8.; St. Kitts, 6 brls., £20.

COBALT ACETATE—
Copenhagen, 2 cs., £50.
Paris (F.), 1 cs., £25.

COBALT OXIDE—
Genoa (F.), 3 cks., £473.; Paris, 11 cs., £810.; Sydney, 1 cs., £50.

COBALT SULPHATE—
Brussels (F.), 1 cs., £33.

COPPER SALTS (*otherwise undes.*)
Calcutta, 5 drms., £61.

COPPER SUBACETATE—
Melbourne (F.), 1 kg., £7.

COPPER SUBOXIDE—
Barcelona, 1 ck., £13.

COPPER SULPHATE—
Pt. Elizabeth, 11 c., £19.
Singapore, 1 t., £31.

CREAM OF TARTAR—
Adelaide, 3 t., £260.; Auckland, 1 t. 10 c., £130.; Brisbane, 1 t. 10 c., £130.; Cape Town, 5 c., £21.; Christiania, 12 c., £52.; Cologne, 1 c., £5.; Cristobal (F.), 1 c., £6.; Durban, 2 c., £13.; East London (F.) 1 c., £7.; Fremantle, 1 t., £87.; Jamaica 1 c. (F.), £5.; Melbourne, 1 t. 10 c., £130.; Mossel Bay (F.), 6 c., £41.; Newcastle, 1 t. 5 c., £121.; Pt. Elizabeth (F.), 1 c., £7.; Rangoon (F.), 1 c., £5.; Santos, 5 c., £29.; Stavanger, 2 c., £9.; Sydney, 15 t., £1,302.; Tientsin (F.), 1 c., £8.; Trondhjem, 2 c., £9.

DISINFECTANTS (*otherwise undes.*)
Abadan, 1 t., £8.; Aden, 12 c., £18.; Alleppey, 8 c., £30.; Auckland, 2 c., £19.; Barbados, 4 c., £9.; Bombay, 2 c., £7.; Brisbane, 1 t. 3 c., £55.; Calcutta, 4 c., £26.; Canton, 18 c., £29.; Christchurch, 1 t. 15 c., £85.; Demerara, 1 t., £28.; Jamaica, 18 c., £40.; Jesselton, 6 c., £11.; Kilindini, 4 c., £12.; Limon, 18 c., £49.; Melbourne, 5 c., £16.; Pt. Elizabeth, 1 t. 7 c., £77.; Shanghai, 2 t. 4 c., £54.; Singapore, 2 t. 18 c., £90.; Sydney, 18 c., £140.; Tanga, 5 c., £10.; Valparaiso, 5 c., £17.; Wellington, 1 t. 14 c., £81.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 57 kgs., £386.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Adelaide, 1 cs., £48.; Boulogne, 10 kgs., £150.; Brisbane, 1 cs., £8.; Calcutta, 3 cs., £15.; Dunedin, 2 pkgs., £37.; Durban, 2 cs., £28.; Melbourne, 23 pkgs., £540.; Ostend, 1 kg., £18.; Pt. Elizabeth, 2 cs., £24.; Sydney, 2 pkgs., £25.

ETHER—
Alleppey, 1 cs. (pt.), £6.; Durban, 2 cs., £11.; Italy, 1 cs. (pt.), £12.; Jamaica, 15 cs., £25.; Kilindini, 5 cs., £27.

ETHYL CHLORIDE—
Durban, 1 cs., £10.
Pt. Elizabeth, 2 cs., £20.

FERTILISERS (*otherwise undes.*)—
Channel Islands, 2 t., £16.
Gothenburg, 1 t., £25.
Shanghai (F.), 10 c., £10.

FORMALDEHYDE—
Barbados, 1 ck., £18.
Bermuda, 1 drm., £7.

GALLIC ACID—
Brisbane, 1 cs., £8.

GLYCERINE—
Antwerp, 1 t. 19 c., £136.; Bangkok, 10 c., £53.; Bombay, 1 c., £12.; Buenos Ayres, 1 c., £13.; Calcutta, 3 c., £12.; Canton, 1 c., £6.; Cape Town (crude), 50 t. 19 c., £2,519.; Habana, 3 c., £27.; Kobe, 29 t. 9 c., £2,432.; Malta, 4 c., £20.; New York (crude), 25 t. 12 c., £1,193.

GOLD CHLORIDE—
Calcutta, 1 cs. (pt.), £5.
Santos, 1 cs. (pt.), £6.
Wellington, 3 cs. (pt.), £8.

GUANO—
Demerara (F.), 50 t., £813.
Yokohama, 50 t., £650.

HYDROCHLORIC ACID—
Alleppey, 1 c., £5.; Colombo, 3 c., £18.; Demerara, 10 c., £20.; Durban, 4 c., £15.; Kilindini, 3 c., £8.

HYDROFLUORIC ACID—
Pt. Elizabeth, 1 cs., £6.

HYDROGEN PEROXIDE—
Durban, 20 cs., £44.
Kilindini, 4 cs., £27.
Malta, 2 cs., £8.
New Plymouth, 2 cs., £6.

HYPOPHOSPHOROUS ACID—
Melbourne, 1 cs., £16.

IODIDES (*otherwise undescribed*)—
Calcutta, 4 pkgs. (pt.), £296.; Jamaica, 2 cs. (pt.), £40.; Leghorn, 1 cs., £36.; Melbourne, 1 cs., £81.; Rangoon, 1 cs. (pt.), £10.

IODINE—
Alexandria, 1 cs., £62.; Bombay, 3 cs. (pt.), £26.; Genoa, 5 cs., £516.; Leghorn, 1 cs., £103.; Sydney, 1 cs. (pt.), £13.

IODINE (RESUBLIMED)—
Barcelona, 1 cs., £105.; Bilbao, 2 cs., £207.; Calcutta, 5 cs. (pt.), £7.; Melbourne, 1 cs. (pt.), £53.; New Plymouth, 1 cs. (pt.), £7.

IRON AMMONIUM CITRATE—
Calcutta, 1 cs., £9.
Perth, 1 cs. (pt.), £6.
Sydney, 5 cs. (pt.), £84.

IRON PERCHLORIDE—
Melbourne, 5 drms., £6.

IRON SULPHATE—
Melbourne, 1 cs., £6.

LACTIC ACID—
Mossel Bay (F.), 20 cks., £148.

LEAD ACETATE—
Adelaide, 1 ck., £7.
Brisbane, 5 kgs., £11.

LEAD ARSENATE—
Melbourne, 27 cks., £96.

MAGNESIA—
Auckland, 10 cs., £24.; Barcelona, 3 cs., £33.; Boulogne, 2 cs., £10.; Brisbane, 2 cs., £5.; Brussels, 8 cs., £22.; Colombo, 2 cs., £5.; Hong Kong, 2 cs., £5.; New Plymouth, 8 cs., £19.; Nelson, 5 cs., £12.; Pt. Elizabeth, 2 cs., £5.

MAGNESIA (CALCINED)—
Brisbane, 2 cs., £12.
Panama, 1 cs., £9.

MAGNESIUM CARBONATE—
Bombay, 5 cs., £22.; Melbourne, 11 cs., £41.; Santos, 10 cs., £10.; Sydney, 2 cs., £7.

MAGNESIUM CITRATE—
Havana, 4 cs., £30.

MAGNESIUM GLYCEROPHOSPHATE—
Melbourne, 1 cs. (pt.), £6.

MAGNESIUM SULPHATE—
Accra, 5 c., £6.; Bombay, 12 c., £15.; Buenos Ayres, 2 c., £6.; Colon, 5 c., £7.; Durban, 12 c., £22.; East London, 4 c., £5.; Karachi, 5 c., £5.; Melbourne, 7 t. 4 c., £184.; Mossel Bay, 10 c., £13.; Panama, 10 c., £13.; Pt. Elizabeth, 16 c., £21.; St. Lucia, 10 c., £8.; San Francisco, 8 c., £11.; Sekondi, 4 c., £5.; Sydney, 4 t., £112.; Wellington, 5 c., £9.

MERCURIALS (*otherwise undes.*)—
Trinidad, 1 cs. (pt.), £5.

MERCURY AMMONIUM CHLORIDE—
Adelaide, 1 cs. (pt.), £7.
Melbourne, 1 cs. (pt.), £7.

MERCURY BICHLORIDE—
Mombasa, 1 cs. (pt.), £5.
N. Plymouth, 1 cs. (pt.) 1cs.£15.

MERCURY SULPHOCYANIDE—
Sydney, 2 cs. (pt.), £15.

METHYL ACETATE—
Paris (F.), 13 drms., £110.

METHYL SALICYLATE—
Sydney, 2 drms., £29.

NICKEL SALTS (*otherwise undes.*)—
Sydney, 10 cs. (pt.), £21.

NITRIC ACID—
Durban, 5 c., £22.
East London, 2 c., £7.

OXALIC ACID—
Calcutta, 1 cs., £11.

PHOSPHORIC ACID—
Channel Islands, 1 ck., £6.
Perth, 2 cs., £5.
Sydney, 14 cs., £70.

POTASSIUM CARBONATE—
Antwerp (F.), 168 cks., £1,500.
Brussels (F.), 100 cks., £890.
Sydney (F.), 1 ck., £16.

POTASSIUM CHLORATE—
Durban (F.), 1 cs., £6.

POTASSIUM CHLORIDE—
East London (F.), 5 bgs., £5.

POTASSIUM CITRATE—
Adelaide, 1 c., £10.; Auckland, 1 cs., £6.; Melbourne, 1 cs. (pt.), 1 cs., £18.; Perth, 1 cs., £12.

POTASSIUM CYANIDE—
Seremban, 10 cs., £80.

POTASSIUM FERROCYANIDE—
Adelaide, 1 kg., £13.

POTASSIUM IODIDE—
Auckland, 1 cs., £66.; Amoy, 9 cs. (pt.), £6.; Bombay, 2 cs., £178.; Calcutta, 2 cs., £133.; Dominica, 2 cs. (pt.), £9.; Genoa, 3 cs., £258.; Leghorn, 2 cs., £180.; Melbourne, 2 cs. (pt.) £132.; New Plymouth, 1 cs. (pt.), £23.; Rangoon, 1 cs., £22.; Rio de Janeiro, 2 cs., £190.; Sydney, 1 cs. (pt.), £8.; Wellington, 1 cs. (pt.), £22.

POTASSIUM PERMANGANATE—
Auckland (F.), 1 cs., £6.; Colombo, 1 drm., £6.; Demerara, 1 drm. (F.), £6.; Madras, 1 drm., £6.

POTASSIUM PRUSSIATE—
Hamburg, 96 cks., £2,176.
Paris, 5 kgs., £58.

POTASSIUM TARTRATE—
Alleppey, 3 cs., £45.

PRUSSIAN BLUE—
Sydney, 10 cks., £280.

PYROGALLIC ACID—
Melbourne, 1 cs., £5.

ROCHELLE SALTS—
Cape Town, 1 c., £5.

SALAMMONIAC—
Adelaide, 10 pkgs., £45.; Auckland, 6 cks., £50.; Buenos Ayres, 10 cs., £30.; Calcutta, 2 cs., £15.; Madras, 7 cks., £60.; Melbourne, 1 ck., £14.; Pernambuco, 2 cks., £6.; Pt. Sudan, 1 ck., £6.; Singapore, 5 brls., £11.

SALICYLATES (*otherwise undes.*)—
Montreal, 3 cs. (pt.), £18.

SALTPETRE—
Cape Town, 18 c., £41.; Dunedin, 1 t., £42.; East London, 19 c., £41.; Lyttleton, 1 t. 10 c., £61.; Maceio, 19 c., £39.; Maranhao, 10 c., £20.; Melbourne, 17 t., £693.; Mombasa, 2 c., £6.; Pernambuco, 2 c., £6.; Pt. Elizabeth, 2 c., £5.; Santos, 5 c., £12.; Singapore, 2 c., £5.; Sydney, 14 t., £654.

SHEEP DIP—
Cape Town, 2 t. 17 c., £75.
Durban, 6 t. 17 c., £271.
Jamaica, 5 c., £10.

SILVER NITRATE—
Calcutta, 1 cs. (pt.), £11.; Durban, 1 cs., £26.; Monte Video, 1 cs. (pt.), £5.; Mombasa, 1 cs. (pt.), £46.; Para, 1 cs. (pt.), £8.

SODA CRYSTALS—
Hong Kong, 1 t. 1 c., £9.
Punta Arenas, 1 t., £10.

SODIUM ARSENITE—
Durban, 2 t. 5 c., £173.

SODIUM BENZOATE—
Cape Town, 3 c., £35.
Santos, 1 c., £14.

SODIUM BICARBONATE—
Alexandria, 3 c., £23.; Barcelona, 6 t., £84.; Calcutta, 8 c., £26.; Durban, 6 c., £18.; Hong Kong, 1 c., £5.; Mossel Bay, 12 c., £18.; Panama, 10 c., £16.; Pt. Elizabeth, 1 t. 11 c., £48.; Singapore, 10 c., £15.; Tientsin, 4 c., £12.

SODIUM BISULPHITE—
Madras, 1 t., £20.

SODIUM BROMIDE—
Melbourne, 2 cs., £8.

SODIUM CITRATE—
Adelaide, 1 c., £10.; Alexandria, 1 c., £12.; Calcutta, 1 c., £6.; Montreal, 2 t. 10 c., £490.

SODIUM GLYCEROPHOSPHATE—
Melbourne, 1 cs., £7.

SODIUM IODIDE—
Adelaide, 1 cs. (pt.), £12.; Calcutta, 3 cs. (pt.), £25.; Genoa, 5 c., £442.; Leghorn, 2 c., £247.; Melbourne, 1 cs. (pt.), £12.; Santos, 1 cs. (pt.), £23.

SODIUM SALICYLATE—
Melbourne, 2 c., £29.
Santos, 1 cs. (pt.), £9.

SODIUM SILICATE—
Antwerp, 4 c., £7.

SODIUM SULPHATE—
Demerara, 1 t. 1 c., £11.

SODIUM SULPHIDE—
Sydney, 2 t., £51.

SODIUM TARTRATE—
Calcutta, 1 c., £5.; Melbourne, 2 c., £8.; Winnipeg, 2 c., £8.

STRONTIUM CARBONATE—
Santos, 2 cks., £10.

SULPHUR—
Buenos Ayres (F.), 2 t., £30.

SULPHUR (FLOWERS)—
Melbourne, 2 t. 1 c., £32.

SULPHURIC ACID—
Aden, 13 c., £16.; Alleppey, 1 c., £8.; Antigua, 4 t., £67.; Barbados, 2 t., £33.; Berbice, 7 t. 10 c., £150.; Colombo, 4 t. 14 c., £103.; Durban, 6 c., £18.; East London, 1 c., £5.; Jamaica, 2 c., £36.; Kilindini, 1 c., £5.; Mombasa, 7 c., £9.; Tocopilla, 3 c., £13.

SUPERPHOSPHATES—
Durban, 299 t., £2,250.

TANNIC ACID—
Calcutta, 1 cs., £9.
Shanghai, 1 brl., £5.

TARTARIC ACID—
Adelaide, 10 c., £61.; Auckland, 10 c., £54.; Bombay (F.), 1 t. 5 c., £135.; Calcutta, 3 c., £27.; Cape Town, 3 c., £19.; Durban, 2 c., £15.; Fremantle, 1 t. 15 c., £214.; Jamaica (F.), 1 c., £10.; Melbourne, 1 t., £188.; Mossel Bay, 1 c., £10.; Newcastle, 1 t., £122.; New York, 2 t. 10 c., £305.; Pt. Elizabeth (F.), 1 c., £6.; Suva, 1 c., £8.; Sydney, 5 t., £610.; Trondhjem, 2 c., £12.

THEOBROMINE—
Switzerland (F.), 2 cs., £91.

TIN SALTS (*otherwise undescribed*)
Jamaica, 3 cs., £12.

TITANIUM POTASSIUM OXALATE—
Calcutta, 2 kgs., £13.

TURPENTINE—
Delagoa Bay, 3 cs., £9.

ZINC OXIDE—
Barcelona, 10 cks., £46.; Buenos Ayres, 4 cks., £14.; Calcutta, 480 kgs., 2 cks., £333.; Cape Town, 10 bgs., £23.; Copenhagen, 50 cks., £185.; Canton, 4 kgs., £14.; Madras, 480 kgs., £319.; Melbourne, 1 cs., £6.; Petrograd, 33 cks., £235.; San Francisco, 1 cs., £6.

ZINC SALTS (*otherwise undescribed*)
Calcutta, 2 drms., £23.

Week ending October 6.

ANTIMONY REGULUS—
Amsterdam, 2 t.
New York, 24 t. 18 c.

BEESWAX—
Melbourne, 10 c.; Sydney, 8 c.

FULLER'S EARTH—
Genoa, 15 t.; New Orleans, 230 t.; New York, 30 t.; Parnahyba, 10 t.; Rotterdam, 100 t.; Portland (Ore.), 20 t.; Toronto, 40 t.; Vancouver, 27 t.

GLUE, SIZE, AND GELATINE—
Amsterdam, 10 c.; Calcutta, 16 t. 17 c.; Delagoa Bay, 12 c.; Dunedin, 5 c.; Durban, 18 c.; East London, 7 c.; Madras, 2 t. 4 c.; Melbourne, 3 t. 4 c.; Montreal, 1 t. 10 c.; Newcastle, 2 t.; Panama, 2 c.; Paris, 11 t.; Pt. Elizabeth, 17 c.; Rotterdam, 1 c.; Singapore, 10 c.; Shanghai, 15 c.; Sydney, 5 t. 2 c.; Trinidad, 2 c.; Wellington, 2 t. 10 c.; Yokohama, 5 t.

ISINGLASS—
Fremantle, 1 c.; New York, 4 c.

LEAD ASHES—
Hamburg, 15 t.

MINERAL WAX—
Antwerp, 16 c.; Sydney, 2 t.; Trieste, 11 c.

PLUMBAGO—
Gothenburg, 1 t.; Stockholm, 2 t. 11 c.; Sydney, 1 t. 3 c.

QUININE—
Bombay, 10,424 oz.; Calcutta, 18,772 oz.; Colombo, 1,456 oz.; Hong Kong, 1,000 oz.; Mauritius, 240 oz.; Melbourne, 1,300 oz.; Mombasa, 1,088 oz.; Perth, 100 oz.; Shanghai, 1,161 oz.; Sydney, 2,266 oz.; Trinidad, 1,000 oz.

SALT—
Ahwaz, 3 c.; Basra, 3 c.; Dairen, 4 c.; Delagoa Bay, 13 c.; Demerara, 2 c.; East London, 8 c.; Gothenburg, 14 c.; Haiba, 1 t. 14 c.; Hong Kong, 9 c.; Jaffa, 6 t. 16 c.; Madras, 14 c.; Pt. Elizabeth, 5 c.; Panama, 3 c.; Pt. Sudan, 1 c.; Sydney, 1 c.; Tientsin, 3 c.; Timaru, 80 t.

SOAP—
Abadan, 3 c.; Adelaide, 1 c.; Ahwaz, 3 c.; Azores, 2 c.; Bombay, 3 t. 7 c.; Boston, 1 t. 15 c.; Brisbane, 3 c.; Buenos Ayres, 5 c.; Calabar, 1 t. 2 c.; Calcutta, 15 c.; Callao, 4 c.; Colombo, 17 c.; Curacao, 4 c.; Dar-es-Salaam, 1 c.

SOAP—

Iron Nitrate, 80° Tw.	*ton	6	5	0
Iron Sulphate (copperas), delivered in bulk	*ton	2	0	0
Iron Sulphide (lumps)	ton	6	0	0
Lead Acetate (white)	ton	41	0	0
Lead Acetate (brown)	ton	45	0	0
Lead Carbonate (White Lead)	ton	44	0	0
Lead Nitrate	ton	42	0	0
Lime Acetate (brown)	*ton	11	10	0
Lime Acetate (grey), 80%	*ton	22	0	0
Lime Bisulphite (S.G. 1,070)	*ton	8	0	0
Lime Superphosphate, 30%	ton	3	15	0
Litharge (British)	ton	41	0	0
Magnesite, Calcined (delivered)	ton	11	0	0
Magnesite, Raw	ton	3	0	0
Magnesium Carbonate (light)	cwt.	2	0	0
Magnesium Chloride (solid)	ton	3	0	0
Magnesium Sulphate (Epsom Salts, coml.)	ton	4	0	0
Magnesium Sulphate, B.P.	ton	6	0	0
Manganese Borate, 85%	ton	112	0	0
Manganese Sulphate, 90%	ton	45	0	0
Methylated Alcohol, 64° (industrial)	gallon	0	2	1
Naphtha (Wood), Solvent	*gallon	0	6	3
Naphtha (Wood), Miscible, 60° p.	gallon	0	6	3
Potassium Bichromate	lb.	0	0	5½
Potassium Carbonate, 90%	ton	24	10	0
Potassium Chlorate	lb.	0	0	3
Potassium Hydrate (Caustic Potash), 88/90%	ton	29	0	0
Potassium Hydrate (Caustic Potash), 75/80%	ton	26	0	0
Potassium Hydrate (liquid), 50° Bé.	ton	16	0	0
Potassium Chloride 80%	ton	8	10	0
Potassium Nitrate (refined)	ton	25	0	0
Potassium Permanganate (commercial)	lb.	0	0	9
Potassium Prussiate (yellow)	lb.	0	1	0½
Potassium Prussiate (red)	lb.	0	2	9
Potassium Sulphate, 90% (ex ship)	ton	11	0	0
Potassium Sulphocyanide	lb.	0	1	6
Salammoniac, lump (sublimed) 1st & 2nd	cwt.	30/- &	57/-	
Sodium Acetate	ton	24	10	0
Sodium Arsenate, 45%	ton	45	0	0
Sodium Borate (Borax), Crystals	†ton	25	0	0
Sodium Bicarbonate (2 cwt. bags)	†ton	10	10	0
Sodium Bichromate	lb.	0	0	4½
Sodium Carb. (Alkali), 58% bags	†ton	7	10	0
Sodium Carb. (Soda Crystals), bags, car. pd.	†ton	5	5	0
Sodium Chlorate	lb.	0	0	2¾
Sodium Cyanide (100% basis) for export	lb.	8d.	to	8½d
Sodium Hydrate (76% C. Soda), f.o.r.	†ton	19	7	6
Sodium Hydrate (70% C. Soda)	†ton	17	17	6
Sodium Hydrate (60% C. Soda)	†ton	16	17	6
Sodium Hydrate (Liquid, 90° Tw.)	†ton	8	5	0
Sodium Hydrate, 77/78% powdered (99%)	†ton	22	0	0
Sodium Hyposulphite (commercial)	†ton	9	10	0
Sodium Hyposulphite (photographic)	ton	14	10	0
Sodium Manganate (basis 25%)	ton	45	0	0
Sodium Nitrate, 96% ref'd, f.o.r. L'pool	ton	13	5	0
Sodium Nitrite, 100% basis	ton	26	10	0
Sodium Perborate	lb.	0	0	11¼
Sodium Phosphate	ton	15	0	0
Sodium Prussiate	lb.	0	0	5¾
Sodium Silicate (glass), Alkaline	†ton	11	5	0
Sodium Silicate (liquid, 140° Tw.)	†ton	9	0	0
Sodium Sulphate (Saltcake)	†ton	4	10	0
Sodium Sulphate (Glauber's Salt)	ton	3	10	0
Sodium Sulphide (conc.), 60/65%	ton	14	0	0
Sodium Sulphide Crystals (casks)	†ton	9	0	0
Sodium Sulphocyanide (liquid)	lb.	0	0	6
Sulphur (Flowers) ex ship, Sicilian	ton	8	10	0
Sulphur (Roll Brimstone)	ton	8	10	0
Sulphur (Texas Gulf)	ton	5	7	6
Tartar Emetic, 43/44%	lb.	0	1	1
Tin Crystals	lb.	0	1	4
Tin Perchloride fused	lb.	0	1	10
Titanous Chloride	lb.	0	1	0
Zinc Chloride (solution, 102° Tw.)	*ton	20	0	0
Zinc Sulphate, Crystals	ton	13	10	0
METALS.				
Aluminium (Ingot Metal 98/99%)	ton	115	0	0

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers)	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE IMPERIAL ASPECT OF RESEARCH.

THE morning session of the Imperial Economic Conference, on Tuesday, was devoted to the question of the co-ordination and extension of Government-aided research throughout the Empire, and to the closely related question of the future of the Imperial Institute. Lord Salisbury, president of the Council, made a detailed statement on the work and progress of the Department of Scientific and Industrial Research, in which he pointed out the exact relationship in which Government research stands to private research, conducted either at academic institutes or by individual industrial firms. This statement, together with the recently issued annual report of the Department, should lead to complete understanding, on the part of the delegates, of the great value of the work the Department has already done, and particularly of its potentialities with regard to future Imperial development. It will be admitted that co-operation on matters of industrial research between all parts of the Empire is an essential step, both to prevent overlapping and to add one further link in the chain of mutual service, which, under present world conditions, must bind the Imperial partners more closely together. It is gratifying to note, therefore, that the general feeling displayed at the Conference was strongly in favour of such co-ordination and extension, and that as a definite preliminary step a committee has been set up to inquire into the best method of pooling information and making it available Imperially. This committee will probably not overlook the fact that in the Imperial Institute itself we have already an Empire co-ordinating body, which has accomplished work of exceptional importance, more particularly on the development of the raw materials occurring within the confines of the Empire. As a nucleus for the greater extensions that must take place in the future, the Institute would appear uniquely adapted. There is one point in Lord Salisbury's statement, however, which if allowed to go unchallenged may quite conceivably lead to unfortunate consequences from the scientific workers' point of view. Speaking on the advantages possessed by the Government over private enterprises in the matter of fundamental research, Lord Salisbury—we are quoting from the *Times'* report—made the point that "A very large number of scientific men are willing to work for the Government at far less than

would be the true remuneration of their great talents, and are willing, through the Government, to place their knowledge at the service of the community." We are convinced that any Government undertaking the organisation of research, and adopting a policy of comparatively low remuneration to the heads of its research staffs—and a precedent for such a policy would certainly appear established from Lord Salisbury's remarks—would be acting in a manner inimical not only to the interests of the scientific workers, but to those of the Government research organisation itself. In the United States, where Government research is developed at present to a considerably greater extent than elsewhere, the past two years have witnessed a steady exodus of distinguished investigators from the Government service to the direct service of industrial undertakings. Of course, industry in America is to-day more prosperous than it is here, and can thus offer greater inducements to its scientific experts; but it is not logical to suppose that even in this country any but a small minority of eminent investigators can afford to adopt the altruistic attitude ascribed to them by Lord Salisbury.

A NEW ENGINEERING INSTITUTION.

The art of welding involves chemical, electro-chemical, and metallurgical problems of first-rate importance, and for this reason the inauguration of an Institution of Welding Engineers is an event of considerable note to both the chemical and the engineering industries. Hitherto there has been no one association or institution which could be said to be the authoritative technical body dealing with welding. There is, of course, the British Acetylene and Welding Association, and also the Electric Welders' Association, but both these bodies have dealt with the problems associated with their own particular view points, and have thus been more or less partisan. The new Institution of Welding Engineers, however, which held its first ordinary general meeting last week, and has for president Sir Peter Rylands, has been constituted by the leading men in the welding industry generally, and takes its place on a par—*qua* welding—with the large engineering institutions, in that its aim is to foster welding as a whole irrespective of any particular process, and to give welding the status which its importance undoubtedly warrants, but which hitherto it has not secured. It will be all to the good if the other two bodies mentioned above can be brought to see the wisdom of joining forces with the Institution of Welding Engineers, and having one comprehensive institution, and thus the obvious criticism that yet another technical institution has been formed might well be refuted in this case by one institution coming into active existence instead of three, and thus improving the position materially. Until we reach the day of one engineering institution sub-divided into the various sections, which are comprised in the generic term engineering, we must keep to present lines; but the best immediate step is affiliation of the smaller institutions to the original parent ones, such as the large chemical and engineering institutions and societies, and this, probably, will be the next step in development.

THE STATE OF TRADE.

The overseas trade returns for July and August were so unsatisfactory in most respects that a moderate improvement upon them in September is not an occasion that calls for much rejoicing. It may, however, be said of the figures now published that they encourage the hope that the worst of the depression has passed. The adverse trade balance is reduced from £22,500,000. in August to £11,300,000., and the reduction is accounted for by a decline in imports and a rise in total exports. Imports during September amounted to £83,266,000., against £88,743,000. in August. British exports, however, at £63,836,000., show an increase of £3,733,000. on comparison with the previous month, while re-exports are up by some £2,000,000. Leaving the aggregate figures, imports of raw materials show a further small improvement, which suggests that trade prospects are considered sufficiently encouraging to justify larger purchases in certain directions. Under exports, manufactured articles show a healthy increase, the increase being fairly well spread over numerous headings, so that the expansion is not due to special activity in any particular trade. Turning to the figures for the nine months, however, it is a little disquieting to find that imports of manufactured articles are much larger during this year than last. This increase in imported manufactures, of which a large proportion at least could be made at home, doubly hits British labour, since we are buying articles from abroad which we ourselves could produce, at a time when unemployment is more serious than it has ever been.

A BREAK WITH TRADITION.

The proposal of the British Empire Exhibition authorities to do away altogether with gradated awards at Wembley next spring has met with almost unanimous approval from the various sections of exhibitors to which it has already been submitted, and we have little doubt that the representatives of the British Dominions and Colonies also will see the desirability of adopting the proposal. Judged from the absence of precedent, the step is certainly drastic, but is justified in the first place by the unique character of the Exhibition, and in the second place by the fact that the awards made at past Exhibitions, other than those of a limited sectional character, have been made in a very perfunctory manner. This latter fact must not be ascribed to inefficient or unreliable juries, but to the manifest impossibility of fixing upon any basis of comparison by which widely divergent exhibits may be judged. The minority opposed to the new proposal have already raised the objection, amongst other points, that the absence of competitive awards is an invitation to exhibit at a minimum expense. We should think that, far from being a drawback, this is a decided advantage in favour of the scheme, and one destined to secure the co-operation of the greatest number of exhibitors.

THE TECHNOLOGY OF THE CELLULOSE DERIVATIVES.

THE NEWER ETHERS AND ESTERS.

By "Investigator."

In the search for technically valuable derivatives of cellulose, it was only natural that attention should be directed to the cellulose ethers, stability being the keynote of the behaviour of ethers as a class. Since 1912, an extensive patent literature concerning these products has been evolved, mainly by Lilienfeld, while still more recently, considerable interest appears to have been aroused in their applications, notably for photographic film-stock manufacture.

The preparation of cellulose butyrates is also receiving attention, since by the introduction of acid radicles of greater complexity than acetyl, it is hoped to mask the cellulose molecule and so endow it with useful solubility properties. Esters of fatty acids, such as the palmitate and stearate, should be of interest from the point of view of water-resistance, while esters containing chlorine should be of some service in the preparation of non-flaming celluloid and allied materials, provided they can be prepared without degradation of the cellulose.

Denham (*Chem. Soc. Trans.*, 1921) has utilised the formation of cellulose methyl ether in order to elucidate the structure of the cellulose molecule. Thus, by repeatedly methylating cellulose by treatment with caustic soda and dimethyl sulphate, only three methyl groups could be introduced. The product (44.6 per cent. methoxyl) was insoluble in Schweitzer's reagent solution, differing in this respect both from cellulose itself and from the mono and di-methyl ethers.

Ethylation of Cellulose with Diethyl Sulphate.

Starting with viscose, a water-soluble ether can be obtained as follows: A caustic soda solution of cellulose is first prepared by coagulating the material at 100° C. with alkali, washing, and then dissolving the residue in strong caustic soda (50 per cent.). To 1,200 parts of this solution, containing approximately 100 parts each of cellulose and alkali, 100 parts of 30 per cent. caustic soda are added, and the warm mixture ethylated by the gradual addition of diethyl sulphate (300 parts). The reaction product is then freed from by-products by washing, first with sulphuric acid (10 per cent.) and then with warm water. Finally it is purified by treating the water solution with alcohol, when the ethyl cellulose separates as a white powder.

To convert the water-soluble ether into the insoluble variety, it may be still further ethylated. For this purpose, the former product is mixed with about 4½ parts of alkali, added either as powder or as 50 per cent. solution, and etherified by heating to 100° C. with about 22 parts of diethyl sulphate (*Brit. Pat.*, 149,320, of 1920). Ethylating in presence of a large excess of alkali is also claimed to render the ether very resistant to water. Thus, in the case of the water-soluble preparation already described, the cellulose solution is treated with 250 parts of caustic soda, instead of with 30 parts, and the proportion of ethylating agent doubled. A similar principle underlies the procedure of H. Dreyfus (*Brit. Pats.*, 164,374-5 and 7, of 1919), who prepares cellulose ethers, giving solutions of high viscosity, by kneading a mixture of moist cellulose and alkylating agent with a high proportion of solid alkali. Thus, according to the Specifications, 100 parts of cellulose (1 molecule calculated as $C_6H_{10}O_5$), containing 100 parts of water, are incorporated with 650 parts of powdered alkali (14 molecules) and 115 parts of diethyl sulphate (6½ molecules). The reaction is carried out at about 50° C. and takes several hours. To promote the ethylation, finely divided copper and copper salts may be added.

Instead of alkali-soluble cellulose derived from viscose, hydrocellulose, prepared from cellulose itself, will serve as initial material. For this preparation, cellulose is warmed with highly concentrated alkali and the hydrocellulose precipitated by acid. Another method of preparing the cellulose for ethylation, is to mercerise it by soaking in alkali, to squeeze out the excess, and then to incorporate the finely-divided product with powdered caustic soda. In order to retard oxidation of the cellulose by the alkali during the grinding process, the latter is carried out in the presence of inert liquids such as benzol, carbon tetrachloride or ether, and in the absence of air.

With a view to utilising both ethyl groups in the ethylating agent, it is proposed to operate in the complete absence of water. To this end, the caustic soda is replaced by sodium oxide, when any water formed as a product of the reaction is eliminated by combination with the excess of the latter. Other "water-binding" agents may be added, such as the oxides of calcium, barium and magnesium, sodamide or calcium hydride. In an example, 100 parts of cellulose, containing 12½ parts of water, are ground with 70 parts of sodium oxide. In this way, ethylation can be carried out with the theoretical proportion of diethyl sulphate (*Brit. Pat.*, 187,639, of 1921).

Use of Halogen Derivatives as Etherifying Agents.

In general, the etherification of cellulose can be accomplished by heating cellulose with alkali and alkyl bromides or iodides in a closed vessel for several hours. The chlorides may be used instead of these comparatively expensive reagents. According to Young (*Brit. Pat.*, 184,825, of 1921), the reaction is carried out in a revolving autoclave and ethyl chloride pumped in under pressure. The published details of the process which yields a water-insoluble ether, are as follow: 100 parts cellulose (1 molecule) is soaked in caustic soda (40 per cent.) so that it absorbs 125 parts NaOH and 60 parts water. This material is then ethylated by heating at about 100° C. for several hours with 1,500 parts ethyl chloride (20 molecules) in the presence of finely-divided copper. Any unchanged ethyl chloride is recovered, and after washing away the excess alkali, the product is dissolved in glacial acetic acid and precipitated by water. Methyl, propyl and amyl chlorides are also applicable, the resulting products being soluble in glacial acetic acid, but insoluble in water, benzene, methyl or ethyl alcohol. Similarly, benzyl derivatives can be prepared, using benzyl chloride and aqueous caustic soda at 90° C. The products, unlike cellulose, are insoluble in Schweitzer's reagent solution, and, on account of their colloidal properties, should be valuable as plastic materials (Gomberg and Buchler, *J. Amer. Chem. Soc.*, 1921).

In this connection, the methylation of highly-dispersed cellulose in the colloid mill may be mentioned. For this preparation, cellulose (1 part) is dispersed with water (12 parts) in the presence of methyl alcohol (3 parts). To complete the reaction, hydrochloric-acid gas is introduced. Complex ethers may be prepared by etherifying cellulose with the halogen derivatives of glycol and other polyhydric alcohols and their ethers. According to the specification, such ethers can be utilised for artificial silk, capable of being readily dyed (*Brit. Pat.*, 166,707, of 1920). Technically-valuable derivatives, which are presumably glycol ethers, result from the action of ethylene oxide and its homologues on cellulose in the presence of palmitic acid (*Ger. Pat.*, 363,192, of 1920).

Properties and Solvents of Cellulose Ethers.

Many of these derivatives are soluble in water but become insoluble on warming the solution. On adding alcoholic soda, a sodium derivative insoluble in alcohol is precipitated. Because of these properties, it is advisable to wash the reaction product with warm water and with dilute sulphuric acid. As is to be expected from their nature and from their mode of preparation, the cellulose ethers are extremely stable, resisting for prolonged periods both the action of water (at 170° C.), and of alcoholic and aqueous caustic soda (25 per cent.). Further, the materials are non-flaming, and, in the presence of suitable "softeners," form strong, pliable films. They melt at about 160° C.

A wide range of low and high boiling-point solvents is available, many of these being comparatively inexpensive. Among the latter may be mentioned the xylene-alcohol, carbon tetrachloride-alcohol and carbon tetrachloride-benzol, binary mixtures. It is noteworthy that none of these are solvents at ordinary temperatures for cellulose acetate. The hydrogenation products of naphthalene constitute cheap high boiling-point solvents. During the last three years, a large number of patents have been granted to the American Kodak Company, covering numerous solvents and cellulose ether compositions. Among such solvents are many chlorhydrocarbons of both the paraffin and the aromatic series, and their binary mixtures with the simpler aliphatic alcohols. Many esters, alone and in admixture with the common alcohols, are useful solvents, particularly the simpler esters of acetic, butyric, benzoic and salicylic acids. Other solvents worthy of mention are pyridine, furfurol, phenol-alcohol and the toluene-methyl alcohol mixtures. Ether, phenol or toluol by themselves are non-solvents, but the binary mixtures with alcohol constitute excellent solvent media.

Among very high boiling-point solvents, suitable for use as "softeners," are phenyl phthalate, monochlornaphthalene, phenylpropyl alcohol, sulphones, and the sulphonamides of aromatic hydrocarbons and their hydrogenation products (*Ger. Pat.*, 368,362, of 1921).

Applications of the Cellulose Ethers.

As previously mentioned, the Kodak Company proposes to utilise cellulose ether solutions for the manufacture of photographic films. One such composition consists of ether dissolved in 6 parts of pyridine (*U.S. Pat.*, 1,429,153, of 1922). In the preparation of celluloid substitute, the ether is first made into a paste with a volatile solvent, and the paste is then passed through hot rollers. The dry, brittle product after powdering, is forced into moulds and fused at 160° C. to a homogeneous mass. Efficient insulating properties and stability to heating are claimed for these materials. To improve their resistance to water, the oily products resulting from the action of acetylene on xylol and other coal-tar hydrocarbons in the presence of aluminium chloride, may be incorporated (*Brit. Pat.*, 149,319, of 1920). Softeners producing similar effects are the condensation compounds of benzyl chloride and its analogues with aromatic hydrocarbons. The oil from the vacuum distillation of coumarone resin, is also recommended for this purpose (*Brit. Pat.*, 163,271, of 1921).

Cellulose ethers have been utilised, in a more or less tentative fashion, for the manufacture of artificial silk. For the precipitating bath, substances are used which will take up the solvent, without dissolving or "swelling" the filament. Suitable coagulating media comprise highly-concentrated solutions of zinc chloride, calcium chloride and urea; or the filament may be extruded into a molten bath of the crystals $CaCl_2.6H_2O$ at 70° C. (*Ger. Pat.*, 352,191-2, of 1919). It is asserted that, although as in the case of the cellulose acetates, the hydroxyl groups of the parent cellulose molecule are masked, yet, like cellulose but unlike the acetates, the methyl, ethyl and benzyl ethers can be dyed with direct cotton colours. Also, in spite of their neutral character, basic dyes are applicable, while on account of their stability, the ethers can be dyed with anthraquinone and indigoid vat dyes, in alkaline or acid baths (*Brit. Pats.*, 196,952-3 and 197,281, of 1921).

The Preparation of Diethyl Sulphate.

Interest in the cellulose ethers has naturally directed attention to new and improved methods for the manufacture of diethyl sulphate, a highly reactive product with a wide field of usefulness as a general reagent. The majority of these processes start with ethyl hydrogen sulphate or its salts. Thus, Lilienfeld claims a yield of about 90 per cent. of the sulphate by distilling the sodium derivative *in vacuo* with anhydrous sodium sulphate. A very similar method is that of Kuh (*Brit. Pat.*, 149,688, of 1920), who distils a mixture of ethyl hydrogen sulphate (2 mols.) with anhydrous sodium sulphate (1 mol.) or sodium ethyl sulphate (2 mols.), compounds which combine with sulphuric acid. In other processes, crude ethyl hydrogen sulphate is directly distilled *in vacuo*. For this purpose, the British Cellulose and Chemical Manufacturing Company propose to carry out the distillation in an electrically-heated, vertical tube-still, at 110° C. under 5mm. pressure. The raw material, prepared from ethyl alcohol (60 parts) and 70 per cent. fuming sulphuric acid (40 parts), is allowed to flow in a thin film into the heated zone, when the sulphate distils off, while the residue collects at the bottom of the still. Very volatile products, such as alcohol and ether, may be condensed at −80° C. or absorbed in oleum (*Brit. Pat.*, 175,077, of 1920).

According to Lilienfeld, ethyl sulphate is formed when ethyl hydrogen sulphate, prepared by the interaction of chlorsulphonic acid ($Cl.SO_2.OH$) and ethyl alcohol, is kept at 100° C. for some time. On adding ice to the reaction product, the ester is precipitated and this can then be separated off or extracted with solvents. The residual aqueous liquor is utilised for the preparation of sodium ethyl sulphate (*Ger. Pat*, 360,527, of 1918).

An interesting process is the preparation of dialkyl sulphates by the direct action of sulphur trioxide on aliphatic alcohols, in the presence of suitable dehydrating agents, such as phosphorus pentoxide. Inert solvents may act as reaction media (*Brit. Pat.*, 143,260, of 1920). Sidgwick treats pure sulphuric acid or a solution of ethyl hydrogen sulphate in this acid with a large excess of ethylene-containing gases at 70° C. The sulphate may be isolated from the reaction product by extraction with ligroin or benzene (*Brit. Pat.*, 157,578, of 1919). By the action of sulphuryl chloride on ethyl alcohol a mixture of ethyl chloride, ethyl sulphate and ethyl hydrogen sulphate is formed, in accordance with the following equations:—

$$2C_2H_5OH + SO_2Cl_2 = SO_2(OC_2H_5)_2 + 2HCl.$$
$$2C_2H_5OH + SO_2Cl_2 = C_2H_5O.SO_2.OH + C_2H_5Cl + HCl.$$

On distilling the reaction product, the last-named compound yields the normal ester. Instead of sulphuryl chloride added as such, equimolecular quantities of the constituent gases—namely sulphur dioxide and chlorine—may be passed into the alcohol (*Brit. Pat.*, 117,824, of 1917).

Cellulose Formates and Butyrates.

The reaction of formic acid with cellulose is not a simple ester formation. A diformate is the primary product, but this decomposes with the liberation of formic acid and modification of the cellulose complex. According to a very recent specification, Plauson claims to be able to prepare cellulose esters by esterification of very finely divided particles of dry cellulose (less than 0.01mm. in diameter) with gaseous reagents (*Brit. Pat.*, 200,160, of 1922). Hydrochloric acid gas (½-5 per cent.) and ultra-violet light serve to catalyse the reaction. Acetates, aceto-formates or aceto-propionates result, according to the composition of the acylating gases. With more than 10 per cent. of catalyst, the products are said to be ethers.

Cellulose butyrates have recently claimed some attention as possible substitutes for the acetates. The esterifying medium consists of a mixture of butyric acid and anhydride, while "butyration" is induced by pre-treating the cellulose with a dilute solution of sulphuric acid in acetic or butyric acid (*Brit. Pat.*, 167,143, of 1921, and *U.S. Pat.*, 1,425,580, of 1922). Benzene, containing as little as 10 per cent. by volume of methyl or ethyl alcohol, is stated to dissolve these esters in the cold. Other solvents are, chloroform, acetone, phenol, hot methylated spirit, hot benzol and hot solvent naphtha. Cellulose carbamates have also been suggested as useful esters. They can be prepared by heating cellulose with phenyl isocyanate in the presence of a tertiary base such as pyridine, and pouring the product into water.

Esters of the Higher Fatty Acids.

Esters of the higher fatty acids can readily be obtained by the action of the respective acid chlorides on cellulose in the presence of pyridine or quinoline. According to Grün and Wittka (*Z. angew. Chem.*, 1921), the distearate and dilaurate, prepared by acylating cellulose with a large excess of a benzene-solution of the chlorides, are fibrous substances, insoluble in the usual solvents for cellulose esters. They dissolve in fats and fatty acids at high temperatures. Very recently, however, Gault and Ehrmann (*Comptes. Rend.*, 177, 1923), have described the preparation of soluble esters by treating hydro-cellulose (1 part) with the acyl chloride (5 parts) at 115° C. for several hours, benzene and pyridine being present. Thus obtained, the fatty esters are amorphous substances, insoluble in alcohol, acetone and glacial acetic acid, but soluble in most other organic solvents to give colloidal solutions. By acylating cellulose, modified by solution in cuprammonium reagent, cellulose hexapalmitate has been obtained, a white, amorphous substance, fusing at 78° C., soluble in chloroform, but insoluble in alcohol.

Cellulose Esters of Aromatic Acids.

By the action of benzoyl chloride on unmodified cellulose in the presence of pyridine, a monobenzoate results, but with mercerised cotton, in the presence of 15 per cent. alkali, the product is a dibenzoate. The latter derivative is soluble in acetic acid and in chloroform. On nitrating these esters, they are converted into nitrobenzoate-nitrates. Cellulose will react with phthalic anhydride, in the presence of zinc chloride, especially if it has been modified by treatment with glacial acetic acid containing chlorine. Diethyl phthalate will serve as reaction medium, but the resulting phthalic ester is of no great value as a cellulose acetate substitute, as it is insoluble in all the common solvents (Levey, *J. Ind. Eng. Chem.*, 1920).

Cellulose Derivatives Containing Chlorine.

In an attempt to prepare cellulose derivatives with very definite physical characteristics, Barnett (*J. Soc. Chem. Ind.*, 1921), has studied the action of chloracetyl chloride on cellulose. The reaction is usually of a very drastic character, and if uncontrolled, leads to the formation of water-soluble

products. In any case, the cellulose complex undergoes resolution, as a result of the hydrochloric acid liberated during the process. In the presence of pyridine, benzene and acetic acid, the reaction product contains about one-fifth of a chloroform-soluble ester with a chlorine content of 3 per cent. This substance melts at 256° C., but is readily hydrolysed by water.

Non-inflammable cellulose compounds, soluble in water, result from the action of chlorine-substituted fatty acids on mercerised cellulose in the presence of caustic alkali. Thus, after mercerisation with alcoholic soda, the material may be treated with mono-chloracetic acid; or the mercerised cellulose may be kneaded with sodium mono-chloracetate in the presence of dilute alcoholic soda. Obtained in this way, the sodium salts dissolve in water to give clear, viscous solutions, but the copper, aluminium and lead derivatives are insoluble (*Brit. Pat.*, 138,116, of 1920).

The Chloro-Acetates.

Very recently, however, a water-insoluble chlorine derivative, which is presumably a chloro-acetate, has been described (Mardles, *J. Soc. Chem. Ind.*, March 29, 1923). This material has a chlorine-content of about 27 per cent., the empirical formula being $C_{12}H_{13}O_8Cl_3$. Compared with other esters, the maximum moisture absorption is much less, the water content, after exposure to a moist atmosphere, being. 6.6, 1.0, and 0.6 per cent., for the acetate, nitrate and chloro-acetate respectively. In its behaviour with solvents, this derivative closely resembles the acetate, as described in a previous article (*Chemical Trade Journal and Chemical Engineer*, August 10, 1923). Thus, there is an enormous increase in solubility within a very narrow temperature-range (two or three degrees). In the case of benzyl and tolyl alcohols, these temperatures were 25° C. and 47° C. for a cellulose acetate and 57° C. and 75° C. for the chloro-acetate. A much wider array of solvents is available in the case of the latter derivative, as instanced by its solubility in aromatic ethers. These liquids dissolve the chloro-ester at moderate temperatures, but only gelatinise the acetate. Aliphatic esters are, for the most part, good solvents, while only the simpler homologues are useful in the case of the acetate. A case in point is amyl acetate, a liquid without solvent action on the acetate even at moderately elevated temperatures, yet dissolving the chloro-compound at temperatures above −60° C.

In their resistance to precipitation by added non-solvents, the chloro-acetate sols resemble cellulose nitrate sols rather than those of the acetate. A measure of this resistance is given by the so-called "solvent numbers," values which denote the volume of liquid necessary to begin the precipitation from one c.c. of a 5 per cent. solution at 15° C. A selection of these numbers (taken from the paper already cited) is contained in the above table, the non-solvent in this case being petroleum spirit, boiling-point range 90-100° C.

5 Per Cent. Sols.	Chloro-acetate.	French Variety Acetate.	Nitrate.
Acetone	0.75	0.14	0.68
Methyl acetate	0.54	0.11	0.59
Ethyl acetate	0.53	Non-solvent	—
Butyl acetate	0.2	,,	—
Amyl acetate	0.08	,,	1.0
Tolyl acetate	—	,,	0.66
Ethyl formate	0.56	0.05	0.32
Acetic acid	0.22	0.2	0.63
Methyl alcohol	—	Non-solvent	Non-solvent

The Titration of Boric Acid.—According to M. G. Mellon and U. N. Morris, in a paper presented at the recent Milwaukee meeting of the American Chemical Society, mannitol, glycerol, etc., increase the degree of ionisation of boric acid in aqueous solution to such an extent that one may then determine it by titration with a base in the presence of a suitable indicator. Many polyhydroxy-organic compounds, such as polyalcohols, sugars, polyphenols and hydroxyacids, change the acidic properties of the acid; but the pH curves for its titration in the presence of these compounds show that when used in the proportion of four moles of organic compound to one of boric acid, only a few are of value for making volumetric determinations. Of the compounds used the polyalcohols are the most effective, while the hydroxy-acids are of no value. From the standpoint of effectiveness along with low cost, invert sugar seems to be the most desirable.

SHELLAC*

ITS PRODUCTION, USES, ADULTERATION, AND TESTING.

SHELLAC is a manufactured material produced from lac, the excretion of the East Indian insect "*Tachardia Lacca*." The young insects swarm twice a year, alight on the twigs of various species of trees on which they feed, and pierce the bark with their beaks. The assimilated sap excreted by the insect soon dries, and the multitude of tiny animals, becoming cemented to the twig, lay myriads of minute eggs and ultimately die. In a short time the eggs burst forth into life, and the swarm of young insects appear on the branches like blood-red dust. Generation after generation dwell upon the same twig, until the lac coating often attains a thickness of half an inch.

In May and June, and again in October and November, the incrusted twigs are gathered by natives and broken into short pieces These are the stick lac of commerce. Prior to the introduction of synthetic dyestuffs stick lac was collected, primarily, for the production of the red lac dye, and shellac was a by-product. Lac dye is now obsolete, and the stick lac is collected only for the manufacture of shellac.

The stick lac is crushed, washed to remove most of the dye, and dried, the so-called seed or grain lac resulting. The grains are ruby red and about the size of wheat. Shellac is usually made by melting dry seed lac with approximately 0.05 to 0.25 per cent. of arsenic sulphide (orpiment), with or without the addition of small amounts of rosin, in long narrow bags over a charcoal fire. The softened lac mixture is forced through the bag by twisting it. The material forced through the bag is then softened again and made into thin sheets, which are broken into the familiar flakes of the shellac of commerce.

Grading and Usual Adulterants.

The grading of shellac is based upon freedom from rosin and dirt and upon the colour of the flakes. Rosin has been the most common adulterant of shellac because of its low price, and especially because it greatly facilitates the melting of the seed lac. The best grades of shellac are free from rosin, but material containing from 3 to 5 per cent. of rosin is a common grade, and for many purposes serves as well as the pure material. Lower grades of shellac frequently contain even higher percentages of rosin.

The addition of orpiment to shellac seems to be regular practice, and some authorities have claimed that arsenic sulphide causes a vulcanising effect analogous to the action of red sulphide of antimony on rubber. A portion, at least, of the orpiment remains unchanged in the shellac, and tends to give the flakes a lighter appearance. This effect is apparent only in the flake shellac, because on dissolving the flakes in alcohol the orpiment settles out slowly, and its tinting power is thereby lost.

Garnet Lac, Button Lac, and Bleached Shellac.

Garnet lac is a product usually made from the residue of impure lac left in the bag after the squeezing process. The sand and other impurities are usually eliminated by dissolving this impure lac in alcohol or dilute sodium-carbonate solution, filtering, and then driving off the solvent or liberating the lac from the alkaline solution by acid respectively. The dark-coloured product is fused into lumps of various sizes. Button lac is essentially shellac fused into a mass the shape of a button. Bleached shellac is manufactured by dissolving orange shellac in dilute sodium-carbonate solution and bleaching with sodium-hypochlorite solution. The red lac dye is thereby destroyed, and the shellac is then precipitated by mineral acid as an amorphous yellowish-white mass. White shellac prepared in this way is quite sensitive to heat, and must be dried with care at rather low temperatures, or it may become partially or wholly insoluble in alcohol. Bleached shellac which has been stored for a time tends to become more or less insoluble in alcohol.

Properties of Orange Shellac.

The specific gravity of orange shellac varies from 1.08 to 1.13, owing to minute air bubbles inclosed during its manufacture. The melting point is indefinite, and decomposition commences if shellac be heated much above 100° C. It is

* From Technological Paper (No. 232) of the Bureau of Standards of the U.S. Department of Commerce (Government Printing Office, Washington, 5 cents). Compiled by P. H. Walker and L. L. Steele. The Paper also includes a method for determining the amount of alcohol-insoluble matter in shellac, and for determining the non-volatile matter in shellac varnish.—Ed. *C.T.J. and C.E.*

insoluble in dilute mineral acids, but dissolves readily in ammonia or solutions of sodium carbonate, borax, and other alkalies. It dissolves (with the exception of a small amount of natural wax and mineral matter) in cold methyl or ethyl alcohol or a mixture of these two (denatured alcohol). It should be noted that high-proof alcohol must be used. Ethyl or denatured alcohol much weaker than 95 per cent. by volume does not dissolve shellac perfectly. Shellac is also soluble in isopropyl and amyl alcohols (fusel oil), but is quite insoluble in petroleum hydrocarbons and turpentine, a property possessed to the same degree by no other common resin soluble in alcohol. Orange shellac is very stable, and does not depreciate in quality even during long storage.

Shellac Varnishes.

Shellac has a diversity of uses in the industries. Orange and bleached shellac are components of composition articles, such as buttons, phonograph records, imitation ivory, poker chips, sealing wax, and many similar products. Shellac is used in making electrical instruments, in various types of insulation, in fireworks and explosives, and as a binder in abrasive wheels. One of the largest single uses for shellac is in the vehicle of anti-corrosive and anti-fouling paints for the protection of the hulls of steel vessels.

Shellac varnish is very commonly used as a quick-drying coating for floors, furniture, interior decoration, musical instruments, toys, etc. It is extensively used for stiffening straw and hard felt hats, for insulating and waterproofing, in various leather dressings and polishes, and upon willow and rattan goods. The resistance of a dried film of shellac to turpentine and turpentine substitute (mineral spirits) is of great value where shellac is employed as a first coating to fill the pores of wood and cover resinous knots and streaks, because the varnish or wax polish applied afterwards does not soften the shellac. This valuable property is not possessed by most of the so-called shellac substitutes upon the market.

So-called standard shellac varnish is made by dissolving five pounds of the resin in one gallon of special denatured alcohol (U.S. Internal Revenue Bureau formula No. 1 for special denatured alcohol, used in making shellac varnish, consists of 100 gallons ethyl alcohol 190° proof and 5 gallons of approved methyl alcohol). Commercial shellac varnish usually contains a smaller percentage, 4 to 4½ pounds of shellac per gallon of alcohol being a common proportion. As already noted, shellac requires alcohol of high proof for its solution. The formulæ for completely denatured alcohol of the United States Internal Revenue Bureau in every case call for "100 gallons ethyl alcohol not less than 160° proof," mixed with small amounts of materials like kerosene or pyridine bases which render the mixture non-potable. Alcohol of 160° proof is not strong enough properly to dissolve shellac, and since the maker of completely denatured alcohol is not required to use ethyl alcohol stronger than 160° proof, it follows that the ordinary denatured alcohol purchased in the open market is generally unsuitable for mixing with shellac. The specially denatured alcohol (formula No. 1) should be used in shellac when it is obtainable, otherwise completely denatured alcohol, 190° proof, should be employed.

In making shellac varnish, the weighed resin in flake form should stand overnight in a closed vessel with the proper volume of 190° proof alcohol. The mixture should then be stirred at intervals until no more lumps are present. Mechanical-stirring devices are usually employed in factories.

Shellac varnish dries only through evaporation of the solvent. In humid weather it may happen that the rapid evaporation of alcohol from the film will sufficiently lower the temperature to cause condensation of moisture. This may turn the film white temporarily, but eventually the coating should dry to its normal colour. A shellac film does not possess the waterproof qualities and resistance to weather of a good long oil spar varnish, and hence is not suitable for outside exposure. If it were possible to prepare an oil varnish from shellac and linseed or tung oil, it should be an excellent product, owing to the hardness and permanence of this resin; but, unfortunately, shellac will not mix with such drying oils or with turpentine.

Qualitative Detection of Rosin in Shellac.

It has been recognised for some time that the regular methods in use for testing shellac are in many cases inadequate to show that given samples are unadulterated. Shellac varnishes have been more difficult to examine for adulterants than flake shellac.

For many years the purity of a given sample of shellac varnish has been decided upon the results of a qualitative test for rosin. The test commonly used is the familiar Liebermann-Storch reaction, in which a solution of a sample containing rosin in acetic anhydride should give a fugitive lavender colour with sulphuric acid of specific gravity 1.53. Livache and McIntosh (*Manufacture of Varnishes*, 3, p. 306) state that the Liebermann-Storch test gives a decided response when shellac contains as much as 10 per cent. of rosin, but only a doubtful test may result when 5 per cent. of this adulterant is present.

Some experimental work done at the U.S. Bureau of Standards indicates that powdered rosin, which has become partially oxidised through exposure to air, will not give a positive test by the Liebermann-Storch reaction. It was found that an oxidised sample of rosin will, however, give a purple colour by the Halphen-Hicks reaction.

The reagent consists of two solutions: (A) 1 part by volume of phenol dissolved in 2 parts of carbon tetrachloride, and (B) 1 part by volume of bromine in 4 parts of carbon tetrachloride. The most convenient procedure is the following: Dissolve a small quantity of the substance to be tested in 1 to 2 c.c. of solution A. Pour this solution into one of the cavities of an ordinary porcelain colour-reaction plate and fill an adjacent cavity with solution B. Cover the plate with a watch-glass, and note whether the bromine vapours develop a purple or blue colour in the solution of the sample to be tested.

Quantitative Estimation of Rosin.

The quantitative estimation of rosin in dry orange shellac by a determination of the Wijs iodine number was recommended in 1907 by a sub-committee on shellac of the American Chemical Society. This method was made a tentative standard by the American Society for Testing Materials in 1914, and was adopted as standard in 1917. (*See* A.S.T.M. Standards, 1921, p. 663). It has been extensively used, but is open to a number of criticisms. The method depends upon the fact that pure shellac resin normally shows a very low iodine absorption value (18 is arbitrarily taken as the maximum figure), while rosin shows an abnormally high value (arbitrarily taken as 228). When a sample of shellac is found to have an iodine value greater than 18, a calculation by a simple proportion is made to estimate the percentage of rosin present

One of the most serious objections to the method is the fact that it is not applicable to shellac varnishes. The presence of alcohol interferes with the iodine number determination, while removal of all traces of alcohol by heating a sample of shellac varnish tends to change the iodine value of the shellac. The determination of the Wijs iodine value of shellac requires unusual care and skill in order to obtain reliable results. There are samples of shellac with an iodine number as low as 14, and it is conceivable that an addition of as much as 2 per cent. of rosin could be made to such a sample without increasing the iodine value above the allowable limit for pure shellac. At the same time, this small percentage of rosin might be undetectable by a qualitative test of the sample. There is evidence that the rosin used to adulterate shellac tends to decrease in iodine value with increased age, due to partial oxidation. A sample of T. N. shellac containing rosin, which showed a Wijs iodine value of 30.4 in 1912, altered in a sealed bottle so that its iodine value in 1921 was found to be 26.8. F. P. Veitch, of the Bureau of Chemistry, U.S. Department of Agriculture, has noted recently that the change in iodine number of rosin exposed to the air in powdered form is more rapid than commonly supposed, and that marked changes often take place in less than a month's time.

It can also be shown that the iodine numbers of rosin and of manila gum (a resin sometimes used to adulterate shellac) are dependent upon the weight of sample taken for the test. In one case when the iodine number of a rosin (W. W. Grade) was determined by the A.S.T.M. Wijs method, as the weight of sample decreased from 0.1446 to 0.0476 gramme, the iodine value obtained increased from 185.0 to 255.0.

A New Improved Method Applicable Also to Shellac Varnishes.

It is apparent that some new method is needed which can be applied to both flake shellac and shellac varnish for the

detection and estimation of adulterants like rosin and manila gum. Some years ago Langmuir made the observation that pure shellac is very nearly insoluble in petroleum ether, while rosin dissolves readily in this solvent. McIlhiney (*J. Am. Chem., Soc.*, 30, p. 867, 1908) developed a method for the quantitative estimation of rosin in shellac, based on the above observation, but apparently the method has not been used to any extent. A study of McIlhiney's method led to certain changes which shortened and simplified the procedure, and finally resulted in a modified method by which it is believed to be possible to detect adulteration and give quality ratings for both dry shellac and shellac varnish.

Manipulative Details of the New Method.

Pètroleum ether distilling between 55 and 75° C.* was obtained by the distillation on the steam bath of commercial petroleum ether. Glacial acetic acid was diluted with water until its solidification point was between 13 and 14° C.

Method. — Accurately weigh 2 grammes of flake shellac (± 0.1 g) and transfer to a 2-litre Florence flask, the neck of which has a volume somewhat over 100 c.c. In case of a shellac varnish, determine the percentage of non-volatile matter first. Place a portion of the well-mixed sample in a stoppered container. Weigh the container and sample. Transfer a weight of the sample corresponding as closely as practicable to 2 grammes of non-volatile matter to the flask already described and restopper the container. Weigh the container again, and by difference calculate the exact weight of the portion transferred to the flask. Calculate the exact weight of shellac in the sample taken from the percentage of non-volatile matter in the varnish.

The procedure from this point is the same for dry and cut shellac. Add 20 c.c. of the special acetic acid, and heat the flask until the shellac, resin, and wax are dissolved. With certain shellac adulterants there may be a small amount of resin which cannot be dissolved. Cool the flask to room temperature (19-21° C.), whereupon a part of the natural shellac wax usually separates. Add slowly from a pipette 50 c.c. of the petroleum ether cooled to 19-21° C., with constant shaking of the flask, allowing one to two minutes for the addition. Add all at once from a graduated flask 100 c.c. more of the petroleum ether kept at 19-21° C., stopper the flask, and shake vigorously. While shaking the flask, slowly add tap water kept at 19-21° C., until the shellac has separated as an amorphous mass. Half fill the flask with water and agitate, so as to wash thoroughly the ether layer. Add water until the petroleum ether layer nearly fills the neck of the flask, cork, and let the flask stand until the ether layer is free from suspended particles. Transfer 100 c.c. of the ether layer to a 100 c.c. graduated flask. It is convenient to fit the large flask with a two-hole stopper with tubes arranged like a wash bottle, so that the ether solution can be blown into the graduated flask.

Evaporate the 100 c.c. of petroleum ether solution, portion wise if necessary, in a small weighed Erlenmeyer flask on a hot plate. When the dry point is reached, suck out the residual solvent vapours, cool the flask, and weigh. The weight of the residue multiplied by 150 and divided by the weight of shellac taken is the percentage of "matter soluble in petroleum ether." Dissolve this residue in 25 c.c. of a mixture of equal volumes of 95 per cent. denatured alcohol and benzol (the mixture should be previously titrated to a faint pink colour with dilute alkali, using phenolphthalein as an indicator), and titrate in the cold with 0.1 *N* alcoholic sodium hydroxide with phenolphthalein as an indicator. Calculate the acid number of the "matter soluble in petroleum ether" (milligrammes of KOH required for 1 gramme of petroleum ether residue). Transfer most of the petroleum ether layer remaining in the Florence flask to a small beaker or flask, and evaporate to dryness. Test this residue for rosin by means of the Halphen-Hicks test already referred to. Report a faint purple or blue colouration as "faint test for rosin" and a deep purple or blue as "decided test for rosin."

A series of orange shellac samples was examined by the modified McIlhiney method as outlined, and the analytical data are given in the report. The iodine value of each sample by the Wijs method, a qualitative test for rosin on the original sample and on the petroleum ether residue, and a calculation of the percentage of rosin from the Wijs iodine value of the adulterated samples are also given.

* A fraction with initial boiling point of 40° C. should be satisfactory, provided it is not used in extremely hot weather.

General Conclusions on the Interpretation of the Results.

An examination of the results indicated that a large number of the samples of shellac were free from rosin, as shown by a qualitative test and by an iodine value below the arbitrary accepted limit of 18. Such samples can probably be safely considered as unadulterated shellacs. These samples of pure shellac, with few exceptions, yielded values between the limits of 6.0 and 7.0 per cent. for material soluble in petroleum ether and acid values for this residue between the limits of 60 and 90. This material soluble in petroleum ether is believed to be chiefly a natural shellac wax, which is stated by Livache and McIntosh to be present to the extent of approximately 6 per cent. in shellac, and is composed of ceryl and myricyl alcohols, partly in combination with fatty and resinous acids. These limiting values are believed to be characteristic of pure shellac.

From a consideration of all the data obtained, it was concluded that if a sample of shellac contains unoxidised rosin as an adulterant, the material soluble in petroleum ether of the sample will exceed the percentage 7.0 by a figure closely approximating the percentage of adulterant present. If a sample of shellac is appreciably adulterated by partially-oxidised rosin or by manila resin, the difference between the percentage of material soluble in petroleum ether found and 7.0 per cent. will represent a minimum figure for adulteration, and in many cases the real adulteration may be twice or, in extreme cases, three times this minimum figure. The consideration of the acid value of the residue soluble in petroleum ether of samples of shellac under examination may give valuable information. This value for a normal pure shellac lies between 60 and 90. Any marked departure from these limits should place a sample under suspicion. In general, adulteration with acid resins like rosin or manila gum should tend to increase this value above the normal, while neutral resins or waxes, or resins of low acid value like coumarone, paraffin, and ester gum (rosin glyceride), respectively, would tend to lower the acid value of the petroleum ether residue below the normal for pure shellac.

Valuation of Samples of Shellac.

The following table will be found a suggested method for rating samples of shellac from the data of the modified McIlhiney method: —

Suggested Method for Rating Samples of Shellac.

Petroleum Ether Soluble Percentage.	Rosin Test.	Acid Number of Residue.	Purity.
7.0 or less	Negative	60—90.....	Pure.
7.0—8.0.....	Positive.....	May be greater or less than 90.	Slightly adulterated; probably 1—2 per cent. rosin, as in "Superfine."
7.0—8.0.....	Negative	do.	Suspicious; no adulteration proved.
8.0—12.0.....	Positive.....	Generally, but not always over 90.	Somewhat adulterated: probably a "T.N." shellac.
8.0—12.0.....	Negative	do.	Somewhat adulterated with an adulterant other than rosin.
12.0—20.0.....	Positive or negative.	do.	Badly adulterated; possibly as high as 40 per cent. adulteration.
Over 20.0	do.	do.	Grossly adulterated; possibly no shellac present.

The Colour of Orange Shellac.

Normal samples of orange shellac contain small percentages of mineral matter, wax, and inclosed bubbles of air. As previously mentioned, a small amount of orpiment is usually added in the manufacture of shellac. The shellac flakes are therefore not transparent to light, and for this reason colour standards for comparison with the flakes are not practicable. The apparent light colour of some samples of orange shellac may be misleading where such effect is caused by air bubbles or the use of orpiment. When such a sample is dissolved in alcohol, the orpiment tends slowly to settle, the inclosed air bubbles are released, and the resulting solution may be darker than the solution of a flake shellac containing less inclosed air and orpiment and apparently of a darker shade when in flake form.

In the following table are some data on samples of white shellac, garnet, button, stick, and seed lac, and several commercial orange shellac varnishes.

Data on Shellac Varnishes, Bleached Shellac, Garnet Lac, Etc.

Trade Name of Sample.	Matter Soluble in Petroleum Ether.	Acid Number of Petroleum Ether Residue.	Iodine Number of Shellac.	Qualitative Test for Rosin on Original Sample.	Qualitative Test for Rosin on Petrol'm Ether Residue.	Classification According to preceding Table.
	Per cent.					
V. S. O. cut-in alcohol	6.1, 6.2 — 6.2	64.0, 68.0 — 66.0	—	Negative	Negative	Pure
Orange shellac varnish	24.5, 25.4 — 25.0	136.5, 136.0 — 136.5	—	Positive	Positive	Grossly adulterated
Do.	8.8, 9.0 — 8.9	33.0, 32.0 — 32.5	—	Negative	do.	Somewhat adulterated
Do.	10.8, 10.9 — 10.9	90.0, 91.5 — 91.0	—	—	do.	Do.
Do.	12.6, 13.0 — 12.8	95.0, 94.5 — 95.0	—	Positive	do.	Badly adulterated
White shellac varnish ...	13.3, 14.0 — 13.7	24.5, 23.0 — 24.0	—	—	do.	Do.
Dry white shellac ...	7.6, 7.9 — 7.8	87.0, 88.0 — 87.5	11.3, 10.9 — 11.1	Negative	do.	Slightly adulterated
Garnet Lac .	13.5, 12.9 — 13.2	150.5, 147.0 — 149.0	39.8, 40.1 — 40.0	Positive	do.	Badly adulterated
"C" Garnet Lac.	5.8, 5.6 — 5.7	111.5, 114.0 — 113.0	18.9, 18.7 — 18.8	Negative	do.	Very sl'tly adulterated
Button Lac .	7.8, 7.7 — 7.8	83.5, 79.0 — 81.0	13.8, 15.5 — 14.7	do.	Negative	
Stick Lac ..	11.9, 12.1 — 12.0	99.0, 97.5 — 98.0	16.9, 18.2 — 17.6	do.	do.	
Seed Lac ...	7.4, 7.3 — 7.4	81.5, 78.5 — 80.0	14.4, 15.0 — 14.7	do.	do.	

The modified McIlhiney petroleum-ether method has been used recently by H. A. Gardner, of the Institute of Paint and Varnish Research, Washington, D.C., in the examination of a series of orange shellac varnishes, and the data obtained are given fully in the report.

THE "SOLUBILITY TEST" FOR LEAD COMPOUNDS.

VALUE IN THE PAINTS INDUSTRY.

THE possibility of the paint industry having a solubility test imposed upon it by Statute, was the *raison d'être* a paper by Dr. Fox delivered to the Oil and Colour Chemists' Association on Thursday, October 11. It will be remembered that the Departmental Committee on House Painting and Coach Building adopted in 1915 the "solubility test" in respect of the pottery industry. Although this recommendation has not yet been acted upon, certain Government Departments have attempted to enforce it, and the test has been incorporated to some extent in legislation in other directions. The whole question was re-examined by another Committee specially appointed to inquire into the difficulties left by the previous Committee, and a report was published in February of this year. The findings of this second Committee, however, did not include a recommendation as to a solubility test, nor was any opinion expressed as to the desirability or otherwise of one being imposed upon the paint industry, but it was recommended that some authoritative body should carry out further research work, particularly in the matter of durable substitutes for white lead.

Statutory Definitions of "Lead Compounds."

In 1920 the Act of Parliament prohibiting the employment of women and young persons in certain industries using or manufacturing lead compounds was passed, and for the purpose of the Act, the term "lead compound" was defined to include any soluble lead compound, or mixture containing lead compound, declared to be such by Order of the Secretary of State. Two Orders have been issued in this connection, the first on October 1, 1921, under Section 79 of the Factory and Workshops Act of 1901, and the second on November 8, 1921, and these have particular reference to glazes used in the pottery industry. The decision to place a statutory limit upon the quantity of lead was the result of the extensive researches by Professors Thorpe and Oliver in 1898. The first Order referred to, states that "lead compounds" means any carbonate, sulphate, nitrate or acetate of lead or any material used in the manufacture of such compounds and containing 5 per cent. or more of lead, but excluding lead or ores which contain lead only in the form of sulphide. The second Order states that "lead compound" shall mean any compound of lead, other than galena which, when treated in the manner prescribed, yields to an aqueous solution of hydrochloric acid, a quantity of soluble lead compound exceeding, when calculated as lead monoxide, 5 per cent. of the dry weight of the portion taken for analysis. The prescribed manner is the following:—A weighed quantity of the material which has been dried at 100° C. and thoroughly mixed, is to be shaken continuously for one hour, at the common temperature, with 1,000 times its weight of an aqueous solution of hydrochloric acid containing 0.25 per cent. by weight of hydrogen chloride. This solution is then to be allowed to stand for one hour and filtered. The lead salt contained in the clear filtrate is then to be precipitated as lead sulphide and weighed as lead sulphate.

The Solubility Test on Commercial Lead Pigments.

After pointing to the possibility of such a test being made compulsorily upon the paint industry, Dr. Fox gave a number of results of tests upon coloured paints, which demonstrated that many of them contain less than the prescribed 5 per cent. of soluble lead, the tests having been carried out on samples obtained in commerce and not specially prepared samples. An important consideration in the solubility of lead compounds, he continued, is the undoubted effect of fine grinding, which had also been gone into by Professor Thorpe, and it was added that with lead compounds used with paints in the experiments at the Government Laboratory, it was found that the degree of fineness is usually such as to secure the maximum solubility under the conditions of the 5 per cent. test. Discussing the results obtained with various lead pigments, it was stated that white lead, litharge, and red lead are entirely soluble in 0.25 per cent. hydrochloric acid. The lead in basic lead silicates and lead monosilicates is completely dissolved. Lead sulphate differs from white lead in its behaviour in the solubility test inasmuch as the acid solution obtained contains presumably also sulphuric acid, which means that the solubility of the lead, expressed as a percentage of the solid matter taken, becomes constant so long as excess of lead sulphate is present.

Misleading Results with Basic Lead Chromates.

Similar remarks apply to certain other lead salts, such as lead chromate, molybdate and sulphide, derived from acids which precipitate lead from faintly acid solutions. In all these cases, depression of the solubility of the lead oxide dissolved by hydrochloric acid may occur. For this reason, no marked increase in the solubility is found with mixtures containing lead sulphate in excess of a certain value. The importance of the knowledge of the solubility of lead sulphate for the present purpose arose from the occurrence of this compound in certain lemon and middle chromes. Normal lead sulphate itself has a solubility of 2.8 per cent. calculated as lead monoxide, but basic lead chromate has a much higher solubility since all the basic lead oxide is dissolved. The solubility of mixtures of lead chromate with lead-free pigments remains nearly constant at 2.6 per cent., while a mixture of 50 per cent. lead chromate and 50 per cent. lead sulphate gives a higher solubility, exceeding 16 per cent.

Mr. C. A. Klein (Brimsdown Lead Co.), speaking in the discussion, said he regarded the test more as a question of physiology than physical chemistry. It was a moot question whether solubility in gastric juice was of the prime importance which was given to it in the so-called Government test. He looked upon this as a wholely empirical test, and admittedly one that had proved its value in practice, but beyond that, one could not go very far.

Influence of Fineness of Grinding.

Mr. J. Parrish (Brimsdown Lead Co.), speaking on the question of fineness of grinding, said a great deal depended upon the manner in which the material was ground. In one case, material intended to pass a 150 mesh might be so finely ground as to pass a very large percentage through a 200 mesh. On the other hand, similar material might be so ground that the whole of it only just went through the 150 mesh, and there would be a difference in the solubility of material ground presumably to the same degree of fineness.

Dr. T. M. Legge (H.M. Chief Medical Inspector of Factories) said he was perfectly satisfied, in the case of the pottery industry, that whether the lead entered the body through the lungs or by the stomach, low-solubility glaze

was perfectly innocuous and should be encouraged in every possible way.

Mr. J. A. F. Wilkinson (Woolwich) said he had made many experiments upon commercial pigments, and the results agreed very well with those of Dr. Fox. He had investigated a number of lead and zinc oxides and found, as Dr. Fox had done, that the lead sulphate was completely dissolved under the test referred to. There were many cases where the insoluble lead was less than 5 per cent., and it seemed possible to produce a lead chrome, for instance, which would come within the regulations.

The Test Quite Empirical.

Dr. H. H. Morgan said it seemed to him that the solubility test had very little justification apart from the statistics put forward by Dr. Legge. It was quite an empirical test, and he had not gathered from Dr. Fox why the limit had been put at 5 per cent. There was no correlation between the physiological effects of lead poisoning and this solubility test.

Dr. Legge added that with the possible exception of Holland, he did not think any other nation than Great Britain had a standard of solubility, and when the German proposal of a standard of 2 per cent. metallic lead was made, it was strongly supported and it was impossible to argue that our 5 per cent. solubility was better and would be much better if it were adopted.

Dr. Fox, in a brief reply to the discussion, said this whole question had to be considered on broad lines and be regarded as a works test. If a limit of 5 per cent. were imposed and it was found in certain cases to be 5.5 or 6 per cent., he did not suppose anyone would worry much about it. It would have to be treated as a matter of practical politics.

THE BRITISH EMPIRE EXHIBITION.

ORGANISATION AND PROGRESS.

TO those of us who have been privileged to peep behind the scenes and to gain first-hand impressions of the work being done towards next year's gigantic undertaking at Wembley, it is obvious that a very great constructive effort is being made. This effort is backed up with vast sums of money and by keen brains on a scale which we think no other country, either in the Old World or in the New, could undertake at the present time. This is all to the good as there is every indication that our Home and Empire trade will derive impetus from the Exhibition in direct proportion to the amount of concentrated effort and co-operation put into the work of organisation and preparation. In view of the natural interest of all our readers, and particularly of our overseas readers, in the progress of the Exhibition, it is our intention to place before them from time to time the latest information on such progress. In this way, by knowing exactly and well in advance what they will see when they visit Wembley next year, our readers will be able to derive the maximum benefit from their visit.

It is encouraging to know that, as we have pointed out on several occasions previously, the Chemical Section of the Exhibition will be the last word in efficiency. This indeed is only as it ought to be, but so many things in this world fall short of what they should be, and what with energetic, informed and enthusiastic leadership they easily could be, that the credit to be accorded to the organisers of the Section cannot be withheld.

Exhibitors in the Chemical Section.

The following list of exhibitors in the Chemical Hall is approximately complete and will be seen to include the names of our most prominent manufacturers in the domains of heavy chemicals, fine chemicals, dyestuffs and intermediates, soaps, pharmaceutical products, and other branches.

Ajax Aniline Dye Manufacturing Co., Ltd.
Albright and Wilson, Ltd.
Stafford, Allen and Sons, Ltd.
J. and E. Atkinson, Ltd.
F. W. Berk and Co., Ltd.
A. Boake, Roberts and Co., Ltd.
Boots Pure Drug Co., Ltd.
J. C. Bottomley and Emerson, Ltd.
British Alizarine Co., Ltd.
British Cyanides Co., Ltd.
British Drug Houses, Ltd.
British Dyestuffs Corporation, Ltd.
The British Soap Co.
Brunner, Mond and Co., Ltd.
Bryant and May, Ltd.
Burgoyne, Burbidges and Co., Ltd.
Burroughs, Wellcome and Co.
Burt, Boulton and Haywood, Ltd.
W. J. Bush and Co., Ltd.
Carnegie Bros.
J. M. Collett and Co., Ltd.
The Colne Vale Dye and Chemical Co., Ltd.
Clayton Aniline Co., Ltd.
Joseph Crosfield and Sons, Ltd.
Cussons Sons and Co., Ltd.
James H. Dennis and Co., Ltd.
Joseph Dixon Crucible Co.
Dolly and Drummer Dyes.
Wm. Edge and Sons, Ltd.
Duncan Flockhart and Co., Ltd.
The Erasmic Co., Ltd.
Fairy Dyes, Ltd.
Gas Light and Coke Co.

The position of the Chemical Hall is an ideal one. Visitors to the exhibition arriving at Wembley Park Station enter at the North Entrance, and the Palace of Industry is on the right hand side of the Main Avenue which runs straight to the Stadium—north to south. The Chemical Hall is in the north-east corner of the Palace of Industry; it is surrounded

by two of the 75-foot gangways; there are three main entrances to it.

Members of the Various Chemical Committees.

Members of the various Committees are:—

Publication Committee.—Dr. E. F. Armstrong, F.R.S. (chairman); Mr. E. V. Evans (secretary); Professor J. W. Hinchley, Dr. H. Levinstein, Dr. Stephen Miall, Mr. R. B. Pilcher, Dr. Plimmer, Professor J. Thorpe, and Mr. W. J. U. Woolcock. *Executive Sub-Committee.*—Mr. H. Barrett, Mr. Guyton Butler, Mr. E. V. Evans, Mr. C. Gibbs, Mr. C. A. Hill, Mr. E. Linstead, Sir Max Muspratt, Bart., General N. W. Webber, and Mr. W. J. U. Woolcock (chairman). *Scientific Committee.*—Mr. J. Baker, Mr. F. H. Carr, Mr. E. V. Evans, Dr. J. T. Hewitt, Mr. J. B. Atkinson, Dr. Herbert Levinstein (chairman), Mr. T. Marns, Dr. Stephen Miall (secretary), Mr. E. T. Neathercoat, Mr. R. Pilcher, Commander R. E. Stokes-Rees, R.N., Professor J. F. Thorpe, Professor J. W. Hinchley, and Mr. W. J. U. Woolcock.

Visit to Wembley.

At the invitation of Mr. W. J. U. Woolcock (Association of British Chemical Manufacturers) we were afforded the privilege of a visit to the exhibition grounds on Tuesday, a meeting of exhibitors in the Chemical Hall constituting the occasion.

About 150 chemical and allied exhibitors made the journey to the exhibition where they were met by Sir Lawrence Weaver, K.B.E., Mr. W. J. U. Woolcock (British Chemical Manufacturers Association), and Mr. Clough Williams Ellis (architect). The exact position and area of all spaces allotted were carefully pointed out by these gentlemen, and various helpful suggestions and hints were added with a view to aiding all the firms concerned in the effective design of their exhibits. Construction has reached a very advanced stage, many visitors expressing satisfaction and surprise at the rapid progress achieved. There is no doubt possible now about the absolute completion of the whole work before the exhibition opens, and this rather unusual attainment is most satisfactory. It could only be done by the concentrated energy and organisation of the expert direction which the exhibition has very fortunately secured. The buildings, terraces, bridges, etc., are of the most excellent design and solid construction, ferro-concrete and concrete blocks being the main materials employed.

At a meeting of the exhibitors addressed by Sir Lawrence Weaver and Mr. Woolcock, announcements were made concerning various important incidental details. It has been arranged that exceptionally favourable insurance policy terms will be possible at reduced rates through the combined insurance companies covering buildings, exhibits, and all incidental risks. Fire extinguishers will be provided from a levied fund.

Discussion on Competitive Awards.

A very important and interesting discussion took place on the question of competitive awards. There is a surprisingly widespread feeling against the usual Grand Prix, Award of Honour and Gold Medal arrangement. It is common knowledge that the bulk of desire and opinion in all sections of the exhibition is against gradation. On the other hand there is a sparse minority, consisting for the most part of very famous concerns, who for the past sixty or seventy years have won Grand Prix and medals all over the world, and have regarded them as very formidable and almost indispensable business assets. Two very famous pharmaceutical manufacturers moved that the gradated award system be continued and their arguments seemed extremely reasonable in the case they put forward, but this very large meeting which consisted of practically the whole of the chemical, pharmaceutical, dyestuffs, soap, and perfumery exhibitors voted solidly against them.

This corresponds exactly with what has happened in the Engineering and other groups. It is almost a revolutionary change in exhibition practice, and various reasons may be given to explain it. There is a strong feeling that award committees are not always competent, and that even when competent they are more influenced, unconsciously perhaps, by a costly stand display than by the merit of the goods. Firms who cannot afford a costly display have in the past failed to "catch the judge's eye" as it were.

Another point put forward very strongly was the fact that many people are exhibiting chiefly in the national interest and all would deserve a record or souvenir in return. It was also put forward, and this is a very cogent point, that this is a vast exhibition of the British Empire, and although a Grand Prix or gold medal might be very desirable if won against foreign competition there was no object in pitting themselves one against the other especially against the young developing industries of our Dominions.

Sir Lawrence Weaver announced, that although no definite decision has been reached, yet there is little doubt that a general award of honour or something similar is the overwhelming desire of exhibitors and that this will inevitably be the result. He related very humourously a case where the British exhibitors at a famous Continental exhibition were all awarded a Grand Prix (the time of the award committee being short and it was getting dark!) and they were all very contented and happy about it except one man who called at his London office and said he did not quite understand why he had won the honour as his exhibit had been lost in transit on its way to the exhibition!

Mr. W. J. U. Woolcock proposed a vote of thanks to Sir Lawrence Weaver for inviting them to Wembley, for so ably presiding and for refreshing the assembly with tea. Following this, the visitors were conducted to the huge Stadium which, apart from its wonderful stretch of perfect turf and general accommodation which makes it the finest sports ground in the world, provides from its surrounding terraces a bird's-eye view of the mammoth proportions of the whole of the buildings and grounds.

BRITISH ASSOCIATION OF CHEMISTS.

REPORT OF COUNCIL FOR YEAR 1922-23.

In the report for the year 1922-23 to be presented to the members at the sixth annual general meeting on October 27, the Council of the British Association of Chemists state, amongst other matters, that a decrease is again reported in the membership as at the end of the year. This is due mainly to the economic situation in the chemical and allied industries, particularly in the heavy chemical industry where reductions in salaries have taken place, and further, to the withdrawal of those members who were opposed in principle to the inauguration of the Unemployment Benefit Fund. 42 new members have been elected, 221 have resigned or have been removed from the Register under the operation of the Rules, and losses due to death number 4. The effective membership is thus 912, compared with 1,095 at the commencement of the year.

The Council recommend that no increase be made in the annual subscription for the coming year, and that the system of voluntary donations be continued.

The outstanding feature of the year's work has been the operation of the Unemployment Benefit Fund. In this the economic aspect of the Association has been brought to the forefront, and the results achieved fully justify the optimistic forecasts of the originators of the scheme. This function of the Association is one which can be undertaken by no other chemical organisation. Figures representing a normal year's working are not yet available, but the data acquired allow an approximate estimate to be made of the liabilities during the next few years, and show the Fund to be financially sound.

The Appointments Bureau has been extremely active throughout the year, an average of nearly 10 per cent. of the Full Membership having received the weekly circular continuously. A careful watch is also kept for advertisements of appointments under conditions not consonant with the status of the chemist as a professional man. There are at present 72 members on the Active Register, of whom 46 are returned as unemployed. These figures represent decreases of 1 and 20, respectively on last year.

The relations between the Association and the various other scientific organisations have been uniformly of a harmonious character.

Negotiations with the National Union of Scientific Workers are being proceeded with.

Co-operation between the various chemical organisations, coupled with the education of the general public by chemists themselves, would seem to be the solution of the problem of legal re-definition of the term "Chemist." The Council are of the opinion that until this has progressed to a much greater degree no useful purpose would be served by an active attempt to obtain a statutory right to the title, and that any such action would serve only to antagonise the pharmaceutical profession. Two changes in the Rules are being submitted at the annual meeting.

A fresh Propaganda Campaign is to be opened at the commencement of the Winter Session, and endeavours are to be made to secure the assimilation in industry of a greater number of scientifically trained men and to bring before the public to a greater degree the intrinsic value of applied

science as a national asset. Arrangements have been made for securing the loan of a number of industrial films of great interest to the general body of members. The showing of these films will form part of the Winter Programme of the Sections, and local announcements may be expected in due course.

Although for various reasons the Association has been unable to make as much use of the privilege as in former years, its thanks are again tendered to the proprietors of the *Chemical Trade Journal and Chemical Engineer* for the use of its valuable space for the publication of official matter concerning the Association.

Looking forward to the coming year it must be realised, however, that the successful issue of any action taken by the B.A.C. must in large measure depend on the numerical strength of its membership, and to this end the Council appeal to the general body of members to concentrate on propaganda work, thereby to consolidate the position of the Association both in the industrial and the professional life of the country.

ITALIAN LABORATORY GLASS INDUSTRY.

GREAT EXPANSION IN OUTPUT.

ON the outbreak of war Italy found herself cut off from her foreign source of supply for scientific glassware, and with no home industry to take its place; before the end of 1915 her stocks were exhausted, and it became urgently necessary to provide the Army hospitals with glass phials for hypodermic injections, etc., and with the laboratory glassware required for preparing sera. The Murano glass factories, famous for their artistic production, took up the challenge, and, after an experimental period, succeeded in producing a "neutral" glass tube which complied with the requirements of the Army Authorities. Other kinds of laboratory glass were also perfected, special attention being given to the manufacture of X-ray globes, which must be of glass possessing special qualities of transparency, readily malleable by flame, etc. Glass tubes for boiler levels were needed by the State railways, and these also were produced of satisfactory quality, resistant to extremes of heat and cold.

To-day the Italian output of such glass not only fully supplies the home market, states the Board of Trade *Journal*, but is exported in considerable quantities, neutral glass tubes being in demand in countries such as Spain, France, and Belgium, where they are converted by the home glass-blowing industry into the finished product. In countries where the glass industry is undeveloped, the finished product, glass phials, and other laboratory requisites are in demand. In such goods it is quality rather than price which counts, and the Italian firms are securing a reputation even in competition with the world-famous products of Jena. The output of neutral glass tubes varies from 1,500 to 2,000kilogs. per day; of the small phials for hypodermic injections, etc., about one and a half million are produced daily, and from one to two thousand pieces of laboratory glassware (globes, retorts, beakers, test tubes, mortars, filters, funnels, etc.). The industry employs about 800 men.

INSTITUTE OF CHEMISTRY.

HUDDERSFIELD SECTION.

THE annual general meeting of the Huddersfield Section of the Institute of Chemistry was held on Thursday, October 11, at the Queen's Hotel, Huddersfield.

The report for Session 1922-23 was presented by the Chairman, Dr. H. H. Hodgson. The balance-sheet was approved, and the income of the Section having proved sufficient for present needs, it was decided unanimously to reduce the balance outstanding from Session 1921-22 by making a donation of five guineas to the Benevolent Fund of the Institute. Of the two members of committee who retired this year, Dr. Pollock did not wish to serve again, whilst Mr. J. H. Wilson was willing to do so. Dr. J. Bruce was elected in the place of Dr. Pollock, the committee of the Section now being: Chairman, Dr. H. H. Hodgson; treasurer, Mr. S. Robson; committee, Dr. A. E. Everest, Dr. L. G. Paul, Dr. J. Bruce, Mr. J. H. Wilson; secretary, Mr. T. A. Simmons. The programme for the coming session includes addresses by Professor R. Robinson, F.R.S., in November; Professor R. V. Wheeler, in January; and Dr. L. G. Paul, in February. It is intended to hold, in addition, at least two meetings for discussion. There are now 55 members of the Institute in Huddersfield and district, and of these from 30—40 take some part in the activities of the Section.

THE DIRECTORATE OF THE DYESTUFFS CORPORATION.

IN our last week's issue (page 430) we published the letters written to the *Morning Post* by Sir William J. Pope and by Sir William Alexander respectively concerning the constitution of the directorate of the British Dyestuffs Corporation and the resignation of Professor A. G Green, we now publish below the further correspondence that has occurred—namely, the statement of Professor Green himself and the refutation of Sir William Pope's charges by Mr. J. M. Robertson:—

Statement by Professor Green.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—My attention has been drawn to a letter by Sir William Alexander in the issue of the *Morning Post* of the 10th inst. I do not desire to enter here upon polemical matters, but to correct certain inexactitudes in Sir William's statement.

He says in effect that my retirement (or was it dismissal?) followed upon a peremptory refusal on my part to carry out the decision of the Board with regard to curtailment of research expenditure. The facts are that my resignation was already in the hands of the Board three weeks before I received intimation of their decision to reduce the staff, and this decision was conveyed to me by the managing director at the same time that he accepted my resignation. In my letter of resignation I did not allude to curtailment of staff or expenditure, though I was actuated by the conviction that the present constitution of the Board rendered it incompetent to deal with this or any other technical question.

Sir William Alexander also infers that the decision of the Board to pursue a policy of curtailment was taken with the concurrence of "scientific men" within the Corporation's organisation. I think we are entitled to know who these were. So far as my information goes, the entire scientific and technical staff, and also our outside scientific advisers, were strongly opposed to any further curtailment of the essential chemical services of the Corporation. Such so-called "economies" can only lead to the enfeeblement of the national effort and ultimate return to the pre-war conditions of dependence on Germany.—Yours, etc.,

Oct. 13. A. G. Green.

Mr. J. M. Robertson and "Political Amateurs."

The following letter has appeared in the *Morning Post*:—

Sir,—My attention has been called to the letter of Sir William Pope in your issue of 8th inst., on the subject of the British Dyestuffs Corporation. Its object appears to be, in the main, to impute to Mr. Walter Runciman the responsibility for the management of "Dyestuffs, Limited," in a period extending some seven years after he had ceased to have any control of it. To this proposition Sir William adds an attack upon me, who vacated the Parliamentary Secretaryship of the Board of Trade in May, 1915. In my case his gravamen is a misreported remark made by me as to cases in which business concerns had been ruined by the control of gifted scientific men. Of Mr. Runciman and myself he affirms that "each possessed that certainty and precision of judgment concerning intricate problems of which he knows nothing, so characteristic of the amateur."

Sir William is visibly the amateur of his own definition, for he knows absolutely nothing of my relation to the Dyestuffs concern beyond the fact that I was connected with the Board of Trade at its inception. I never expected to see so striking a confirmation of my (misreported) remark about the unfitness of many scientific men for business functions. But Sir William's infirmity exceeds that of the type in question. The attempt to assign responsibility for the policy of "Dyestuffs" since 1916 to Mr. Runciman is quite—or nearly—the most unscrupulous performance in public life that has come under my notice in the period. Sir William can have few rivals among the politicians in his faculty for false theory and inaccuracy. In this case the bare statement of the dates suffices to expose him. Of course that has been known to happen in the case of a distinguished politician. But the greater the shame of the man of science who, ignorantly meddling with politics, selects for rivalry the most discredited models.—Yours, etc.,

Oct. 15. J. M. Robertson.

THE ORIGIN OF PETROLEUM.

GENESIS FROM VEGETABLE MATTER.

THAT there is still a wide difference of opinion as to the origin of petroleum was manifested at the meeting of the Institution of Petroleum Technologists, held on Tuesday week, when Mr. E. H. Cunningham Craig presented a paper in which he dealt with recent researches bearing upon this question. The subject has been a fruitful source of discussion, and even controversy, but of late years, by what seems to be general consent, there has been a cessation of polemics, and writers on the subject have been content to give bald, and not always accurate, statements of theories put forward, without leaning to one side or the other upon controversial points. The consideration of these theories, of course, should prove valuable, but the avoidance of controversial problems does not appear likely to lead very far towards a definite conclusion. The difficulty is, however, that there are many varieties of petroleum, and, as was pointed out by more than one speaker, it seems impossible to imagine that all these varieties should have been produced by one series of conditions.

Theories of Inorganic Origin Abandoned.

The genesis of petroleum has been variously considered to be inorganic and organic. The two inorganic theories,—which attribute the origin of petroleum to hypogene causes and to vulcanicity respectively—Mr. Cunningham Craig dismissed, the first as being a speculative idea, and not seriously considered nowadays, and the second as not having found acceptance among scientific workers. This narrowed the problem down to the consideration of the two organic theories—namely, that petroleum originated from animal or from vegetable matter. The animal-origin theory is supported chiefly by chemists, whilst that of vegetable origin is held largely by geologists.

Light Shed by the Researches of Dr. Bergius.

Mr. Cunningham Craig favours the vegetable origin theory, and his paper reviewed recent work which throws light on this theory. He called attention to the evidence existing that oil and coal have a definite relation to each other, and dealt with the research work which has been done on the hydrogenation of coal. By treating any coal containing a fair percentage of volatile matter with hydrogen under very high pressure and at temperatures up to 850° F., a remarkable exothermic action is induced, and a portion of the solid fuel becomes liquefied, giving as a result a product indistinguishible from heavy crude petroleum. Similar effects can be obtained by hydrogenating heavy crude oils, lighter oils being formed. The importance of the researches of Dr. Bergius in this connection lie in the attempt to reproduce conditions similar to those that must have occurred in nature during the formation of oil. Oils cannot be formed from coal, except by distillation—the carbon-hydrogen ratio in coal is too high,—so that, in treating a coal to make oil, hydrogen must be supplied, and Dr. Bergius has done this successfully. Before the vegetable matter has reached the coal stage, however, it is still sufficiently rich in hydrogen—*i.e.*, the carbon-hydrogen ratio has not risen too far. Therefore, in an autoclave under sufficient pressure, and at not too high a temperature, we should expect petroleum to be formed from vegetable matter that has not reached the coal stage. It would be interesting, said Mr. Cunningham Craig, if some supporter of the animal theory would conduct the same hydrogenation experiments with deposits containing, or supposed to contain, animal matter, to learn whether liquids indistinguishable from petroleum could be formed from them. The difficulty might be in finding deposits rich enough in animal matter, but there must have been such deposits if there be any truth in the animal origin theory. Different classes of crude petroleum may be formed from the same raw vegetable material, according to the varying conditions of temperature and pressure.

The stage of alteration of the vegetable matter must, however, have some effect upon the final result. Mr. Cunningham Craig discussed research work in connection with torbanite deposits which have been found in Great Britain and the Dominions, and yield oil; they show a stage in the formation of oil from vegetable deposits, checked and arrested owing to the particular environment in each case, and this, he said, is as clear a case of the origin of oil from vegetable matter as can be desired.

A Definition of Petroleum Required.

As was pointed out at the meeting, what is really wanted is a definition of petroleum, owing to the innumerable types that exist. There are many who favour the animal-origin theory, and they put some pertinent questions. For instance, it was suggested that the hydrogenation theory pre-supposed a tremendous quantity of hydrogen in the earth before vegetable matter reached the coal stage. In summing up the points raised, however, Mr. Cunningham Craig said that the animal matter in the earth, in the sea, and on the surface of the earth is so infinitesimal, compared with the amount of vegetable matter, that it would be very difficult for any exponent of the animal-origin theory to bring a good case for it.

Need for a Petroleum Research Association.

The more this question is investigated, the more does it become apparent that there are greater complications than appear at first sight. A great deal has to be done by investigation of the relative chemical constitution, the amount of aromatics, etc., and each petroleum has to be regarded in the light of the geological conditions obtaining in its particular field. Therefore, there does not seem to be any research which so clearly needs co-operation as this, and, as was to be expected, a plea was made for the formation of a petroleum research association, which should try to arrive at a satisfactory solution of the problem. If this were done, the chemist, geologist, physicist and others who are concerned with it could tackle each type of oil scientifically. Even without this, however, much could be done by greater co-operation between the scientific societies into whose sphere this problem enters.

CORRESPONDENCE.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

THE WORLD POWER CONFERENCE.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—The public mind has many things to divert it from events which, though they may not stir the emotions, have a vital relation to human welfare. Nevertheless, one is a little surprised that so scanty notice has been given to the decision to hold next year a conference of the leading experts in the world to consider how the industrial and scientific sources of power—our very life-force as a community—may be nationally and internationally adjusted. In America, in Canada, and on the Continent, far greater interest is being manifested in the project than here.

Although we have made less use than some countries of our power resources, other than coal, it is our honour to have conceived and put into execution this idea of a world-conference; and when it meets I believe that a foregathering of the scientific and technical experts of sixteen nations, together with their Government delegates, will appeal to the imagination of the public. We in this country are behind the newer lands in our exploitation for domestic and industrial purposes of the energies pent up in earth and water. We have much to learn, even in mechanical devices and inventions for their common use. It is therefore of some moment to us that at Wembley next year, from June 30 to July 12, the world's chief authorities on these matters are for the first time in history, on our invitation, to place their accumulated wisdom at each other's service. If no other advantage results than an international standardisation of the commoner power devices, thus simplifying and cheapening production, the calling of this First World Power Conference will be a notable achievement for British initiative.

—Yours, etc.,
George A. Touche.

London, E.C. 2, October 12, 1923.

German Industrial Magnate Sentenced.—It is reported from Berlin that Dr. F. Raschig, head of the Chemische Fabrik Dr. Raschig, has been sentenced, in absence, to five years' imprisonment by the French occupation authorities. It appears that his firm had hired two locomotives from the German railway authorities before the French occupation of the Ruhr, and had not notified the French of the fact, but had continued to use the locomotives.

ALKALI MANUFACTURERS AND GAS UNDERTAKINGS.

DISPUTE AT BRENTFORD.

MR. H. C. HONEY (Director of Gas Administration), during the course of consideration of a draft Order made by the Board of Trade under the Gas Regulation Act of 1920, on the application of the Brentford Gas Company, on Wednesday, October 17, again had before him the question of the insertion of the Model Bill Clause known as the residuals clause. An application for the insertion of this clause, which restricts the gas undertaking from purchasing more than one-third of the amount of residual products which it produces itself, in order to prevent undue competition with chemical manufacturers, was made on behalf of the Alkali Manufacturers Association. The object of the Order in question is to authorise the Brentford Gas Company to purchase the adjoining undertakings of the Harrow and Richmond Companies, and also to erect large new gasworks upon land at Greenford. It is in respect of these new works that the application for the insertion of the residuals clause was made.

Strong Opposition to the "Model Clause."

Mr. Tyldesley Jones, K.C., the leading counsel for the Brentford Gas Company, strongly opposed the application, stating that the company did not now operate under that restriction, and that as recently as 1919, when the company was in Parliament, the restriction was not put upon them.

Mr. Honey asked why it was that the Alkali Manufacturers Association did not ask for the insertion of this clause in 1919.

Mr. W. A. Clark (Messrs. John Kennedy and Co., Parliamentary Agents) said that the 1919 Act was in fact promoted in 1918 whilst the war was still on, and it was not thought patriotic then to do anything to hamper the supply of munitions. The result was that the Alkali Manufacturers Association left it to the authorities of the House to do as they pleased. There were, however, he contended, very special reasons why the clause should be inserted in the present case. The Brentford Gas Company was now becoming one of the very large gas companies of the country, and it was to restrain the large gas companies from embarking upon extensive chemical manufacturing operations that the Model Clause had been drafted and inserted in so many Acts of Parliament. He, therefore, strongly urged the Director of Gas Administration to insert the residuals clause in this Order.

Unfair Monopoly Alleged Against Alkali Manufacturers.

Mr. Tyldesley Jones, K.C., said the reason why the clause was not inserted during the war was that it was found that the manufacture of high explosives was being seriously retarded by the protection which the alkali people had succeeded in getting during times of peace, when nobody foresaw the war. This country was in very great peril for a long time on account of the insertion of this clause in various gas Acts. He was going to ask the Director of Gas Administration definitely to refuse to insert this clause, and he invited the Association of Alkali Manufacturers to raise this matter on the floor of the House of Commons in order that Parliament might have an opportunity of expressing an opinion upon it. It was about time that this protection for the Alkali Manufacturers Association, which nearly produced irreparable injury to this country during the war, was removed. It was perfectly monstrous; the public interests had been absolutely sacrificed to a ring of alkali manufacturers, and it was time Parliament had an opportunity of altering this state of affairs.

OUR BOOKSHELF.

Bulletin of the Imperial Institute. Vol. XXI., No. 1, 1923. Report on the operations of the Imperial Institute. London: John Murray, Albemarle Street, W.; price 3s. 6d. net (3s. 10d. post free).

Prior to the war reports on the work of the Imperial Institute were issued yearly, but the general dislocation caused by the war made the temporary cessation of publication advisable. The present comprehensive volume makes up this lost ground, and deals partly with work accomplished during the war period, but chiefly with the operations of the Imperial Institute in its several branches during the past three years. Its publication is particularly opportune, since one of the matters upon which the Imperial Economic Conference must come to a decision is the future of the Imperial Institute. The present constitution of the Institute dates from 1916, when an Act was passed transferring the property and management to the Secretary of State for the Colonies, with provision for an Executive Council of twenty-five members nominated by the Board of Trade, the Secretary of State for India, the Ministry of Agriculture and Fisheries, the Government of India, the Governments of the Dominions, and the Secretary of State for the Colonies. The work is now concerned entirely with the development of the commercial and industrial use of the raw materials of the Empire. This task is divided between three departments—Investigation, Intelligence, Exhibition. A feature of the organisation is the system of advisory committees, of which there is one for India and each of the Dominions, in addition to five technical committees dealing with raw materials, silk production, timbers, mineral resources, and rubber respectively. The volume just published gives a complete account of the internal organisation of the Imperial Institute. Much of the work accomplished by the Institute during the past nine years has already been referred to in our columns, but the collected results form so striking a reminder of the positive services rendered by the Institute that the possibility of decreasing the scope of its activities would appear a decidedly retrograde step.

Journal of Scientific Instruments. October, 1923; Vol. I., No. 1. (A monthly publication dealing with their principles, construction, and use.) Published by the Institute of Physics (with the co-operation of the National Physical Laboratory). London: 10, Essex Street, Strand, W.C.; price 2s. 6d. net.

This is the first regular number. It is the first publication of its kind in England, and the favourable reception accorded to a preliminary number issued last year has led to the belief that it will have real value as an aid to research and manufacture. The journal will be published on the 15th of each month, and the annual subscription is 30s., post free. The present issue contains articles on "The Measurement of True Height by Aneroid," by L. N. G. Filon, M.A., D.Sc., F.R.S.; "Two New Methods of Measuring the Internal Diameters of Transparent Tubes," by J. S. Anderson, M.A., D.Sc., Ph.D., and Guy Barr, B.A., D.Sc.; "On An Improved Temperature Control for the Pulfrich Refractometer," by T. M. Lowry, D.Sc., F.R.S., and R. G. Parker, B.Sc.; "A New Relay and Its Application to Sustaining Pendulum Vibrations," by H. A. Thomas, M.Sc.; "A General Purpose Recording Drum," by C. V. Boys, F.R.S.; "The Chain Balance," by Professor S. Flinders Petrie, LL.D., F.R.S.; and, "A New Recording Thermometer," by E. H. J. Schuster, D.Sc.

FOREIGN CHEMICAL SAMPLES.

ADVICE TO IMPORTERS.

IN their Bulletin of October 12, the British Chemical and Dyestuffs Traders' Association point out that samples of goods liable to K.I.D. or other *ad valorem* import duties should be despatched by the foreign firm by:—(1) Foreign and Colonial Parcel Post, or (2) Insured Box Post; and the contents and value declared. They will then come through without interruption.

If posted abroad by sample or letter post they will on arrival in this country be seized by Customs and will be held up. Members receiving "Notice of Seizure" from Customs, Mount Pleasant, E.C., of samples of dutiable goods sent by sample or letter post should forward a declaration stating the value of the samples in question. Although Customs have the power to confiscate such packets they will generally agree to deliver same on payment of the duty together with a nominal fine of about one shilling. The above remarks also apply to samples of goods that come under the Dyestuffs (Import Regulation) Act, 1920, and in such instances members will have to obtain and forward to Customs an import licence to obtain delivery of the sample.

ITEMS OF INTEREST.

South Wales Mining Exhibition.—Among the exhibitors are Meldrums, Ltd., who are showing forced-draught furnaces, mechanical stokers, various types of chemical plant, and samples of Meldrum acid-resisting metals.

Change of Address.—Wm. A. Shetliff and Co. have removed from Waterloo Street to more convenient premises, their new address being Lion Mill, Wincolmlee, Hull. Telegrams: "Chromatic, Hull"; and telephone: "Central 1433."

Sulphuric Acid in America. — According to the United States census returns, the production of sulphuric acid by fertiliser manufacturers during the first six months of 1923 amounted to 946,089 tons, compared with 574,013 tons in the same period of 1922. The consumption figures for the same period were 933,824 tons and 657,062 tons respectively.

Streatfeild Memorial Lecture. — The sixth annual Streatfeild Memorial Lecture will be delivered in the Chemical Lecture Theatre of the Finsbury Technical College, Leonard Street, E.C. 2, at 4 p.m. on Thursday, October, 25, by Mr. E. M. Hawkins. The subject will be "Analytical Chemistry," and admission will be free.

Cyanogen Chloride for Fumigating.—Cyanogen chloride is to be substituted for hydrocyanic acid gas in the United States Quarantine regulations relating to fumigation procedure. The change is due to the fact that cyanogen chloride is highly lachrymatory, even in non-lethal quantities, and for this reason it gives ample warning of its presence before it becomes concentrated in sufficient quantities to prove fatal.

Oxygen Research Committee Report.—A report has been published by H.M. Stationery Office, price 8s. 6d. net, for the Department of Scientific and Industrial Research, describing certain aspects of the work of the Committee since its appointment in 1919. The report deals chiefly with the technical difficulties which have hitherto restricted the commercial utilisation of liquid oxygen and liquid air.

Tariff Notes.—The Tunisian import duty on crude iodine has been reduced to 150 francs per 100 kilogs. Iodine from Germany is excepted, and is subject to a duty of 1,600 francs per 100 kilogs.—The importation into Mexico of opium and certain other dangerous drugs is prohibited.—Certain regulations affecting the importation and sale of quinine in Greece may be seen by persons interested on application to the Department of Overseas Trade.

Deodourisation of Benzine and Benzol. — In a process described in the *Giornale di Chimica Industriale ed Applicata* (April, 1923) benzine is deodourised by treatment successively with an acid and then an alkaline solution of potassium permanganate. The first solution is made with 10 grammes of $KMnO_4$, 500 c.c. of water and 80 grammes of H_2SO_4, and the second with 10 grammes of $KMnO_4$, 1,000 c.c. of water and 20 grammes of KOH. In the case of benzol, the odour is due to traces of thiophene, which can be eliminated by boiling the benzol with mercury acetate solution under a reflux condenser. Formaldehyde or acetaldehyde may be used in place of the mercury compound.

The Estimation of Cobalt by Dinitroso-Resorcinol.—According to W. R. Orndorff and M. L. Nichols (*J. Amer. Chem. Soc.*, 1923, 45, 1439), cobalt is quantitatively precipitated by dinitroso-resorcinol when applied in the following manner. To 50 c.c. of a warm solution containing 0.2 gramme of cobalt and 2 per cent. of hydrochloric acid are added 300 c.c. of a hot 0.1 per cent. aqueous solution of the reagent. The mixture is well stirred, and 10 c.c. of a 10 per cent. solution of sodium acetate are added; then the mixture is heated gently for about 15 minutes, stirred, and the precipitate allowed to settle, filtered off on a Gooch crucible, washed with 1 per cent. hydrochloric acid, dried at 125° C., and weighed. The composition of the dried precipitate is $(C_6H_3N_2O_4)_2CO$. The method is applicable without modification in the presence of manganese or zinc, but iron or copper, if present, must be removed. Large quantities of nickel interfere with the estimation, but in the presence of small amounts of this element the method is accurate if the supernatant liquor from the precipitate is filtered off and the precipitate digested for half an hour with warm 0.1 *N* hydrochloric acid, then filtered off and dried as before. The method is applicable to the estimation of cobalt in steel, but the iron must be first removed.—*The Analyst.*

Petrol Prices.—It is generally stated that there is every possibility of a further fall in the price of petrol, and the Press Association has been informed by a leading firm that a small reduction in price is extremely likely before the end of the year.

Marple Gasworks Extension.—It is proposed to carry out important extensions at the Marple Gasworks, which will mean an outlay of £43,000. More land is to be taken up, and the new schemes also include the purchase of properties belonging to the Calico Printers' Association.

Pig-iron Production.—The production of pig iron in September amounted to 558,600 tons, compared with 599,800 tons in August and 430,300 tons in September, 1922. The number of furnaces in blast at the end of the month was 190, a decrease of six during the month, and a decline of 33 since the end of May last.

Fuel Economy and Smoke Abatement.—We are informed by Meldrums, Ltd., that they will be pleased to lend to societies and other institutions, a set of lantern slides dealing with fuel combustion, smoke cure, etc., and containing illustrations of various types of chemical plant, for lecture purposes. Arrangements may also be made for a paper to be read on the subject.

Sugar Beet in Canada.—Experiments in the growing of sugar beet in Manitoba are reported to be eminently satisfactory so far, and strengthen the belief that the United States company which is behind them will next year go ahead with its plans for planting from 10,000 to 12,000 acres to sugar beet and establishing a plant for the manufacture of sugar in the Winnipeg district.

World Raw-silk Production. — The total production of silk in Western Europe, Eastern Europe, the Levant, Central Asia, and the extreme Orient is, according to statistics from L'Associazione Serica Italiana, Milan, equal to 32,235,000 kilos of raw silk for the year 1922, which represents a fairly steady gain over the previous two years, the totals being 29,295,000 kilos for 1921 and 20,830,000 for 1920.

Personal.—Mr. Frederick Charles Lea, Professor of Civil Engineering in the University of Birmingham since 1913, has been appointed to the Chair of Engineering at Sheffield University in succession to Professor Ripper, who is retiring, having reached the age limit.—The Council of the National Institute of Agricultural Botany have appointed Mr. Alfred Eastham, to be Chief Officer of the Official Seed Testing Station for England and Wales.

Rubber Proofers' Expanding Business. — J. Mandleberg and Company, Ltd., Manchester, propose extending their business by the absorption of Harbens, Limited, who built and equipped extensive works at Golborne, at a cost of £160,000., for the manufacture of artificial silk, but work was never started owing to the death of the founder. Mandlebergs propose to transfer the issued capital of Harbens of 111,300 shares of £1. each and £60,000. debentures, and to elect a new board to conduct the business.

Carbon Black in Canada.—To encourage the manufacture of carbon black the Canadian Dominion Government has authorised its production from the surplus quantities of natural gas obtained from isolated fields held under lease for the production of gas. Permits to so use the gas will however only be granted where there is no market for the sale of the gas. The lessee must construct a plant at a cost of 30,000 dollars within two years, capable of producing 90 tons of carbon black per annum, and must pay a royalty of 5 per cent. of the value of the gas at the point of production.

The Baku Oil Industry.—The Baku oil industry, which has now for over three years been in the possession of the Soviet, is being resuscitated. During the early months after the transfer the production receded very materially, from various reasons, such as lack of organisation, wilful sabotage, etc. An improvement set in with the beginning of 1921. For the year from May, 1921 to 1922, the production amounted to 2,799,000 tons, and the output for the corresponding period 1922-1923 is stated to have been 3,340,000 tons. In November, 1920, only 618 wells were being worked. In May, 1923, the number of wells working had reached 1,650. The feet bored between May, 1920, and May, 1921, aggregated 9,100; for the next twelve months the total was 37,900; and for the period May, 1922, to May, 1923, 105,000ft. The number of men employed in this industry had risen to 45,687 hands at the end of May, 1923. Apart from the productive work proper, extensive repair work has been proceeding on factories, railways and workmen's dwellings.—*Engineering.*

Explosives in Coal Mines.—The Secretary for Mines gives notice that on October 5 he made an order under Section 61 of the Coal Mines Act, 1911, extending until December 31, 1925, the period during which the non-detonating explosives named and defined in the second schedule to the Explosives in Coal Mines Order of September 1, 1913, are included in the term "permitted explosives." The only explosive at present included in the second schedule is "bobbinite."

Business Notices.—Mr. G. D. Greenhough states that the partnership existing between himself and Mr. L. G. Boor has been terminated as from October 1, 1923, on the retirement of the latter from business. The two businesses, George Boor and Co., and D. W. Greenhough and Son, will be carried on as before by Mr. Greenhough.—Mr. Frank Kay, lately of the Emerson Chemical Corporation, U.S.A., has entered into business on his own account under the name of the Barclay Chemical Corporation, at 154, Chambers Street, New York.

The Estimation of Glycerine.—In the *Chemical Trade Journal and Chemical Engineer*, of August 3, page 127, there appeared an article on a new direct Italian method for the estimation of glycerine, based upon a paper presented by Professor S. Fachini to the Italian Congress of Chemistry in June last. We now learn that S. Somazzi was joint author of the method with Professor Fachini, and that the Italian verbatim and illustrated account of the paper appeared in the *Bollettino dell'Industria degli Olie e dei Grassi* of June, 1923.

British Association of Chemists.—The sixth annual general meeting of the Association will be held at the Chemical Department, University of Birmingham, Bournbrook, at 3 p.m. on Saturday, October 27, 1923. Prior to the meeting, at about 2.30 p.m., a Chemical Exhibit, arranged by Professor G. T. Morgan, may be visited. The annual dinner will be served at the Queen's Hotel, Birmingham, at 6.30 p.m. Applications for tickets, the price of which is 12s. 6d., should be made not later than Thursday, October 25, 1923. Morning dress.

Obituary.—We regret to record the death, in London, on October 4, of Lieutenant-Colonel Alfred Conway Bishop, chairman of Kemball, Bishop and Co., Ltd., manufacturers of cream of tartar, tartaric and citric acid, Bromley-by-Bow.—We also regret to learn of the death of Mr. James Pain, head of the firm of firework manufacturers, who died on Friday last, aged 85. He was seventh in descent from the founder of the business in the reign of Charles II. The business will be carried on by Mr. Pain's sons, Philip in England, and Henry in America.

Pig-iron Specification for International Trade.—The following recommendations are contained in a letter sent on behalf of the American Society for Testing Materials to the National Federation of Iron and Steel Manufacturers. The recommendations are only meant to apply to international business:—I.—Manufacture: The pig iron shall be clean, as free as possible from an excessive amount of dross and sand, and may be either sand or machine cast. II.—Chemical properties: (*a*) The pig iron shall conform to the chemical requirements specified by the purchaser at the time of purchase, with the following permissible variations from the specified percentages in the case of pig iron intended for the manufacture of grey iron castings: Silicon, 0.25 above and below; sulphur, not over specified percentage; phosphorus, 0.15 above and below; manganese, 0.20 above and below; total carbon, not less than specified percentage. (*b*) In the case of pig iron for making steel, malleable iron or special castings, a maximum percentage of phosphorus and either a maximum or minimum percentage of manganese may be specified. III.—Sampling and analysis: (*a*) In sampling, each truckload (or its equivalent) shall be considered as a unit; (*b*) one pig shall be taken to every four tons in the car, and they shall be chosen from different parts of the car so as to secure, as nearly as possible, a sample representing the average quality of the iron; (*c*) the pigs thus taken shall be sampled by drilling, so as to represent fairly the composition of the pigs as cast; (*d*) an equal weight of the drillings from each pig shall be thoroughly mixed to make up the sample for analysis. IV.—Inspection and rejection: In case of dispute, the sampling and analysis shall be made by an independent chemist, mutually agreed upon (if practicable, at the time the contract is made), whose decision shall be final; the cost of such re-sampling and re-analysis shall be borne by the party in error. All pig iron which fails to conform to these specifications shall be subject to rejection.—*Colliery Guardian.*

Coke By-Products in America.—The following table gives the total production of by-products from coke during the year 1922:

Tar	gallons	327,779,734
Ammonium sulphate	lb.	695,543,349
Ammonia liquor (NH_3 content)	,,	50,036,646
Ammonia, other forms (NH_3 content)	,,	693,782
Crude light oil	gallons	101,437,555
Benzol, crude	,,	2,666,177
Benzol, refined	,,	10,419,504
Motor benzol	,,	57,025,699
Toluol, crude	,,	38,159
Toluol, refined	,,	1,955,119
Solvent naphtha	,,	2,983,858
Crude naphthalene	lb.	6,107,742
Refined naphthalene	,,	1,810,972

Stainless Steel in France.—Some French firms having put stainless steel cutlery on the market, proceedings were taken against them a year ago by the owners of the Brearley patents, who obtained judgment against them first at Havre and then at Rouen. The verdict aroused great indignation amongst the steel firms, which could not understand why a national industry should be made tributary to a foreign patent. Numerous protests have been made from time to time, and it is now stated that several of the leading steel concerns have combined to fight the Brearley patents and decide, once and for all, whether the home industry is to be shackled by a foreign monopoly. They have collected all possible data with a view of proving anticipations, particularly by publications in the technical Press, and it is evident that the struggle will be carried out to the bitter end. Meanwhile, they are giving a guarantee to their customers indemnifying them against any action for damages that may be taken by the holders of the stainless steel patents.—*Engineer.*

COMING EVENTS.

Society of Dyers and Colourists (Manchester Section).—Meeting, **Friday, October 19,** at **7 p.m.,** at 36, George Street. Paper: "Some Aspects of the Theory of Quinones," by Professor R. Robinson.

Society of Chemical Industry (South Wales Section).—Meeting, **Friday, October 19,** at **6.30 p.m.,** at Thomas's Café, Swansea. Joint meeting with South Wales Section of the Institute of Chemistry. Discussion: "Short Cuts in Analysis."

Institute of Physics.—Meeting, **Monday, October 22,** at the Institution of Electrical Engineers, Victoria Embankment, London, W.C. 2. Paper: "The Physicist in the Textile Industries," by Dr. A. E. Oxley.

Institute of Chemistry (Manchester Section).—Annual general meeting, **Wednesday, October 24,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage. Discussion: "Some Aspects of Water Right Cases," to be introduced by S. E. Melling.—**(Glasgow Section):** Annual general meeting, **Thursday, October 25.**

Streatfeild Memorial Lecture.—On Thursday, **October 25,** at **4 p.m.,** at the Finsbury Technical College, Leonard Street, London, E.C. 2. Subject: "Analytical Chemistry," by E. M. Hawkins.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, October 26,** at **7 p.m.,** at 36, George Street.

British Association of Chemists.—Annual meeting, **Saturday, October 27,** at **3 p.m.,** at the University, Bournbrook, Birmingham. Annual dinner at Queen's Hotel, at **6.30 p.m.**

Society of Chemical Industry.—Joint Societies' dinner, on **Wednesday, October 31,** at **7.30 p.m.,** at Hotel Victoria, Northumberland Avenue, W.C. 2. Application for tickets (limited to 300) to be made to the General Secretary of the Society of Chemical Industry.

Hull Chemical and Engineering Society.—Meeting, **Tuesday, October 30,** at **7.45 p.m.,** at the Hull Photographic Society's Rooms, Grey Street. Paper: "British-made Dyes for Paints and Distempers," by G. B. Shaw.

Society of Chemical Industry (Bristol Section).—Meeting, **Thursday, November 1,** at **7.30 p.m.,** at the University, Woodland Road. Paper: "Some Aspects of the Paint Trade: Fine-colour and Lake Making," by A. H. Bridges.

Society of Chemical Industry (Manchester Section).—Joint meeting, **Friday, November 2,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage. Address: "Electrometric Methods in Analytical Chemistry," by Professor W. D. Treadwell, of Zurich.

BRITISH OVERSEAS CHEMICAL TRADE.

SEPTEMBER IMPORTS AND EXPORTS.

IMPORTS of chemicals and allied products were considerably less during September than in August, the figure being, with the exception of July, the lowest this year. On the other hand, exports rose in value by nearly £700,000. on the August total. According to the Board of Trade returns, imports of chemicals, drugs, etc., were valued at £1,023,552. in September, against £1,315,824. in August and £1,032,511. in September, 1922. Exports totalled £2,341,761., against £1,645,856. in August, and £1,733,883. last year. The quantity figures of imports and exports of selected products are given in the table below:—

IMPORTS—Increases on August Quantities.

		1923. September.	August.
Acetic acid (including acetic anhydride)	tons	475	316
Barytes, ground	cwts.	52,900	46,008
Bleaching materials	,,	3,907	1,290
Calcium carbide	,,	65,526	50,896
Cream of tartar	,,	2,912	2,646
Glycerine, crude and distilled	,,	6,902	286
Indigo, natural	,,	74	70
Paraffin wax	,,	66,034	65,389
Petroleum, crude mineral	galls.	35,995,347	34,310,667
Phosphate of lime	tons	32,373	31,584
Potassium c'p'ds (except nitrate)	cwts.	251,714	138,923
Potassium nitrate	,,	27,119	6,263
Tanning extracts	,,	90,299	57,378

Decreases on August Quantities.

Borax	cwts.	3,878	4,150
Boron minerals	tons	259	3,561
Dyeing extracts	cwts.	8,610	8,629
Gums and resins (except rosin)	,,	19,761	21,154
Manganese ore	tons	36,709	61,844
Mercury	lb.	44,459	93,711
Nickel oxide	cwts.	1,500	7,129
Pyrites	tons	15,260	34,551
Rosin	cwts.	123,307	123,624
Sodium nitrate	,,	91,408	262,313
Sodium c'p'ds (except nitrate)	,,	16,661	17,517
Sulphur	tons	9,861	10,065
Tartaric acid (including tartrates not elsewhere specified)	cwts.	915	1,237
Turpentine	,,	49,203	59,048
White Lead	,,	7,574	11,349
Zinc oxide	tons	522	626

EXPORTS—Increases on August Quantities.

Ammonium chloride	tons	402	204
Ammonium sulphate	,,	23,858	17,002
Barytes, ground	cwts.	2,735	427
Bleaching powder	,,	28,028	12,622
Carbolic acid	,,	12,656	11,581
Caustic soda	,,	116,180	110,042
Cement	tons	48,454	25,963
Disinfectants, insecticides, etc.	cwts.	43,273	28,976
Dyestuffs, coal-tar	,,	14,313	12,830
Glue and size	,,	11,534	7,276
Glycerine, distilled	,,	8,195	2,922
Naphtha, coal-tar	galls.	14,583	8,840
Naphthalene	cwts.	18,122	11,168
Pitch, coal-tar	tons	8,695	1,074
Potassium c'p'ds (except chromate and bichromate)	cwts.	4,053	1,601
Salt (other than table)	tons	30,287	28,881
Sodium carbonate	cwts.	473,801	411,306
Sodium sulphate	,,	157,456	101,846
Sulphuric acid	,,	2,983	693
Tar, coal	tons	452	384
Tar oil, creosote, etc.	galls.	4,580,427	2,627,301
Tartaric acid (including tartrates not elsewhere specified)	cwts.	2,003	706
White lead	,,	16,944	7,398
Zinc oxide	tons	247	53

Decreases on August Quantities.

Benzol and toluol	galls.	142,603	366,562
Copper sulphate	tons	116	522
Paraffin wax	cwts.	20,567	28,020
Potassium chromate and bichromate	,,	3,604	3,746

SOUTH WALES NOTES.

[Specially Contributed.]

Further improvement in the tinplate business is reported. The inquiry undertaken by the Indian Tariff Commission on a request of the tinplate industry in India, who are asking that the Indian Government should put into force a protective duty of 45 per cent. *ad valorem* on tinplates and blackplates is arousing much interest among Welsh tinplate manufacturers. The Indian tinplate works are situated at Jamshedpur, and are a subsidiary of the Tata Steelworks Co., Ltd., the bulk of whose capital is in the hands of the Burma Oil Company. A request is also made for freedom of duty on raw tin, palm oil and other commodities used in the process of manufacture of tinplates, including sulphur. The Burma Oil Company is connected with the National Oil Refineries, and have been formerly good customers of ours for tin, terne, and black plates, and if the suggestions are to be carried into effect it will be, without doubt, a great blow to the South Wales tinplate makers. The report of the commission is expected to be made public at the beginning of the New Year.

Among the imports for the week were 10 tons ferro silicon, 31 tons calcium carbide from Gothenburg, 93 tons zinc ashes from Montreal, 1,220 tons pyrites from Seville, 2,923cwt. of nickel oxide from Montreal; 4,261 tons pyrites from Huelva to Newport. Among the exports from Cardiff were 494 tons sulphate of ammonia to Dunkirk; and 30 tons zinc white to Calcutta from Newport.

COMPANY DIVIDENDS.

Sadler and Co., Ltd.—Profit for year to June 30 last, after charging income-tax, interest on pre-paid shares, etc., and providing for corporation profits tax, amounts to £25,002.; brought in, £6,592.; total, £31,594.; to depreciation, £15,000.; further dividend of 4 per cent., less tax, making 7 per cent. for year; forward £7,551.

Alianza Nitrate Company, Ltd.—In addition to an interim dividend of 20 per cent., the directors have declared a bonus of 60 per cent. (less tax) out of surplus funds.

Borax Consolidated, Ltd.—Dividend at rate of 6 per cent. per annum, less tax at 4s. 6d., on preferred ordinary for half-year ending September 30.

Burmah Oil Company, Ltd.—Interim dividend of 2s. per share, free of tax, on the ordinary shares on account of the current year, payable November 7. Last year the interim payment was the same.

Callender's Cable and Construction Company, Ltd.—The directors announce a dividend of 1s. per share, less tax, payable November 2.

Miami Copper Company.—Quarterly dividend of 50 cents per share on the capital stock.

Anglo-Greek Magnesite Company, Ltd. — Interim dividend of 2½ per cent on the ordinary shares.

Rosario Nitrate Company, Ltd.—Interim dividend of 5 per cent., less tax, on account of the profits for the current year, payable on November 16. No interim dividend was paid a year ago.

British Portland Cement Manufacturers, Ltd.—Interim dividend on the ordinary shares of 5 per cent., actual, less tax, in respect of the year 1923. The interim dividend for 1922 was the same.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," October 20, 1888.)

Smoke and Fogs.—A fog is bearable and breatheable; town smoke, *alias* fog, is neither the one or the other. And the grim joke of all this is that the greater portion of it is preventible, and we are persuaded that all the nuisance arises from cheap fuel. Coal being cheap, it is wasted in a most barbarous manner. At several exhibitions it has been shown that with an ordinary Lancashire steam boiler over 11lb. of water can be evaporated per pound of fuel, and yet the majority of our best works are not evaporating more than 6lb. Is not this waste? It is more; it is doing direct injury to the country, inasmuch as it results in sending out into the air nearly double the quantity of noxious gases and many times the amount of carbon that need be.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Clement and Johnson, Ltd., London, W.C., chemists.—Registered September 25, £100., £100., £100., and £300. debs., part of £60,000.

Forster's Glass Company, Ltd., St. Helens.—Registered September 26, Trust Deed dated September 21, 1923, securing £200,000. deb. stock.

Hightensite and Ebonite Manufacturing Company, Ltd., London, W.—Registered October 1, £10,000. debs.

Jones Bi-Metals Company, Ltd., Birmingham.—Registered September 12, £1,500. debs.

Morris (P.) and Co., Ltd., Liverpool, oil and paint manufacturers.—Registered September 24, £3,500 mort., to J. L. Williams, 25, Water Street, Liverpool, solicitor, and another.

Neolyte, Ltd., London, S.W.—Registered October 1, £5,000. second deb., to United Dairies, Ltd., 31, St. Petersburgh Place, London, W.

Yetta Soap and Oil Company, Ltd., Twickenham.—Registered September 25, £200. deb., to H. Duckworth, Cromwell House, Twickenham, manager.

SATISFACTIONS.

Marley Hill Chemical Company, Ltd.—Satisfaction registered October 1, £500., part of amount registered January 4, 1921.

Tomlinson and Co., Ltd., Stairfoot, flint glass manufacturers.—Satisfactions registered October 2, £2,000., registered June 2, 1906; and £1,000., registered January 18, 1909.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Boroid, Ltd., London, E., manufacturers of films, artificial silk, etc.—L. C. Bullock, 7, Devonshire Square, London, E.C., solicitor, appointed receiver.

Shaka Salt Company, Ltd., Middlewich.—E. O. Mosley, 16, Bolton Street, Bury, appointed receiver. September 21.

New Cross Glass Works, Ltd.—Resolved September 25, that the company be voluntarily wound up. C. S. Steel, 34/36, Gresham Street, London, E.C., liquidator.

Oxide, Ltd.—Resolved September 26, that the company be voluntarily wound up. R. Carpenter, Midland Bank Chambers, North Street, Brighton, C.A., liquidator.

S. D. Q. Manufacturing Company, Ltd., Shardlow, chemists.—S. Blythen ceased to act as receiver. September 27.

Clemmons Aluminium, Ltd.—Resolved September 28, that the company be voluntarily wound up. C. T. Appleby, 26, Corporation Street, Birmingham, liquidator.

BANKRUPTCY INFORMATION.

Clemmons, Albert John, Ingleside, 134, Alcester Road South, King's Heath, aluminium manufacturer, trading as **Midland Aluminium,** 42, Great Francis Street, Birmingham. R.O., October 6. Adj., October 6.

Stansfield, John Lord, Boothfold, Waterfoot, Bacup, chemical manufacturer. R.O., October 2.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Dean, Wm. Edward, 7, Wellington Street, Macclesfield; dyer; £39. 9s. 5d. September 6.

Hogan, T. C., and Sons, 75, Oswald Street, Blackburn; manufacturers of medical preparations; £10. 5s. 5d. September 13.

Radium and Chemical Company, Ltd., 145, Moorgate, London, E.C.; £21. 18s. 6d. July 27.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN SEPTEMBER.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of September, 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the returns.

FERTILISER NEWS.

Nitrate of Soda.—The various investigations into the state of the Chilean nitrate industry which have been conducted on behalf of the United States Government from time to time afford much interesting information. While the greater portion of this information is similar in each case, there is much which appears contradictory and uncertain. Three such inquiries have taken place recently under the ægis of three different departments, the Department of Commerce, the Department of Agriculture, and the Federal Trade Commission. On such points as the exact percentage of the selling price handed over to the Chilean Government in export duties, and the proportion of the revenue of the country contributed by the nitrate industry, there is much disagreement. On the question, also, of the situation of the controlling interests in the industry, opinion is divided, Dr. Brand, of the Ministry of Agriculture asserting that policy and prices are dominated by a London group. Dr. H. Foster Bain, on the other hand, maintains that the nitrate industry is not controlled by the London committee, but Chilean interests have the last word in all important matters, the function of the former being merely advisory, and limited in action to propaganda work. Dr. Bain goes further in his report, however, and denies the existence of a trust at all, his reason being that the Association does not own property or make profit, but merely acts as a general sales agency. In considering these two points of view, it is well to remember that while the former drafted his report in London, and based it on information received on this side of the Atlantic, Dr. Bain spent two or three weeks in Chile, and apparently saw enough, or read enough, to justify making a comprehensive and controversial report to Dr. Curtis, his chief at the U.S. Department of Commerce. Yet another aspect, and the most probable one, is presented in the report by Mr. H. L. Anderson, of the Federal Trade Commission. In his opinion, the Nitrate Producers' Association is a trust of the most extreme type, definitely controlling 96 per cent. of the capacity output. As he says, the Association fixes the production quota of each plant, establishes the prices, effects all sales, with absolutely no competitive conditions. Its powers of intimidation were demonstrated recently in its treatment of certain recalcitrant producers who objected to its continuance after the date fixed for its dissolution in January next. There is no doubt that the control of the industry has been gradually passing during the past few years from English into Chilean hands, this change having been encouraged by the Chilean Government. The latest proposal of the Government, to insist on the employment by foreign commercial organisations of a staff which shall be composed of 85 per cent. Chilean and 15 per cent. foreign has concerned several of the British nitrate companies.

Sulphate of Ammonia.—It is gratifying to note from the statistics just published by the Board of Trade, that the reduction in the exports of sulphate during August was only temporary, 23,858 tons going abroad in September, against 17,002 tons in the previous month. All the separately specified importing countries registered an increase in imports of the British commodity; and the only figure dropping below the August amount was the total sent to "other countries." France is a very interesting market at the present time, exports having risen from 972 tons in August to 3,727 tons in September. The gradual recovery of this country as a buyer is an indication of confidence on the part of French merchants, who are laying in stocks, for very little is going inland for consumption. The temporary cessation of imports from this country was probably due to the belief that large quantites of nitrogen fertilisers would be available in the Ruhr, but the policy of the Germans defeated this expectation. Such comparatively small quantities of sulphate as were obtained have proved insufficient to meet the demand. The export figures for the nine months, however, show a considerable falling off when compared with 1922, 21,211 tons against 37,508 tons. Shipments to Japan were also increased, and this country again heads the list, with 9,571 tons, compared with 7,450, and nil a year ago. It would appear from these figures, and especially from the totals for the first nine months of 1923 and 1922, that the effects of the extremely heavy buying in the United States in 1921, and consequent glut on the Japanese market, have finally been dispersed. The market at the present time is in rather a depressed state, nevertheless, apart from the recent disaster, and there is a possibility that large stocks may be left on merchants' hands. Absence of offers of American material, and exceptionally cheap supplies from the United Kingdom have mainly been the reasons for quickened interest and inquiry in this direction. Exports to Spain were very much better than in August, 5,821 tons being shipped in September, compared with 2,204 in the previous month. The figure for the nine months ending September 30, 1923, is thus raised to 52,636 tons, against 21,660 for the corresponding period of 1922. Spain thus takes the place of France, which last year was, up to the end of September, our best customer. The Dutch East Indies, at 700 tons in September and 205 tons in August, did not maintain their average importation, which, on the basis of 19,636 tons for the nine months, works out at about 2,180 tons per month. The British West Indies took 680 tons, and Italy 75 tons, compared with 479 tons and 15 tons respectively in August. Total exports since January 1, 1923, thus amount to 185,006 tons, valued at £3,051,371., against 103,621 tons, worth £1,687,420. for the corresponding period of 1922.

The Dutch Superphosphate Industry. — Most superphosphate factories in Europe are running at a loss at the present time. Only one factory in Holland reported the financial results of its operations last year as satisfactory, states the American Consul at Rotterdam, and this was a co-operative concern with a most modern plant, and so situated as to dispose of its product without expensive transportation or other distribution costs. The situation in Holland is indicated by the fact that while the fertiliser factories of the country have a total capacity of about 450,000 metric tons of superphosphate a year, they have been able to secure a market for only about two-thirds of their possible production, including about 150,000 metric tons of superphosphates consumed in the country itself. This consumption also includes a considerable and increasing net importation of superphosphates, Belgium furnishing practically the whole of the superphosphates imported. Exports of superphosphate increased, on the other hand, from 81,331 metric tons in the first five months of last year to 117,777 metric tons in the same period of the current year. Nevertheless, there seems to be considerable uncertainty as to the immediate prospects for the industry in the Netherlands. The gist of the matter is that the entire industry in Europe is suffering from overproduction, or, perhaps, stated more correctly, from underconsumption, which is due to the economic depression. The large fertiliser factories in France, Belgium, and Germany are struggling for a market in other countries denied them in their own, and it is this fact, incidentally, which is largely responsible for the present difficult situation in the United Kingdom.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(Specially Contributed.)

Production in the coking industry in West Cumberland has almost reached its maximum, and is being fully absorbed in spite of the fact that the output in the hematite pig-iron industry is considerably below normal. Even in times when the number of furnaces blowing between Workington and Carnforth was twice as great as it is now, the coking trade was scarcely any busier. The outlook may be described on the whole as very encouraging. Already ordinary iron is being bought so much more freely than was the case five weeks ago, that no iron is going into stock. It cannot be doubted that as the Government plans for relieving unemployment develop there will be a vigorous demand for iron and steel, and West Cumberland must naturally participate in the larger volume of business that will then be at command. It has to be remembered, too, that activity in the Furness district is not without a beneficial effect upon the Cumberland coal and coking industries. A not inconsiderable part of the make of coke is reserved for the furnaces at the southern end of the hematite pig-iron producing district. At present nearly the whole of the make is going to the local furnaces, the shipments to the Continent having been very slight during the past two or three weeks. Coke to the iron smelters here is from 28s. to 33s. per ton according to carbon content, and to the Continent from 32s. to 35s. per ton, f.o.b. There are no other alterations in prices. Until there are more iron ore pits working, the demand for industrial fuel will be slow. Best steam is 30s. and washed steam 29s. per ton deliveries. East Coast coke supplies to West Cumberland and to the Furness district are below 7,900 tons this week. Residuals are moving away quickly.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Canada.

A firm of manufacturers' agents in Winnipeg, who have been for some considerable time manufacturing their own toilet preparations which are sold throughout Western Canada, desire to secure the representation, on a commission basis, of British manufacturers of drug sundries, toilet preparations, and perfumes. (Ref. No. 384.)

New Zealand.

An old-established New Zealand wholesale firm, with an extensive organisation throughout the Dominion, wish to obtain the agencies of British manufacturers of drugs, Patent medicines, and photographic goods. Goods on consignment are preferred until trade is established. (Ref. No. 389.)

Finland.

A firm of commission agents in Helsingfors desires to secure the representation for Finland of British exporters of spices, saccharin, isinglass (agar agar), vanillin, coumarin, and dulcin. (Ref. No. 394.)

Italy.

A firm in Naples desire to secure the representation of British firms for the sale of heavy chemicals, including caustic soda, potassium and sodium bichromates, chrome alum, bicarbonate of soda, ammonium carbonate, ammonium sulphate, also whale and fish oils, tallow, castor oil seeds, shellac, and gambier. (Ref. No. 397.)

Norway.

A firm of commission agents in Christiania desire to secure the representation for Norway of British manufacturers of asbestos and rubber goods, such as packings, hoses, and also aluminium foil for packing confectionery, etc. (Ref. No. 399).

Spain.

A commission agent of Barcelona is desirous of securing the representation of British exporters of ammonium sulphate, etc. (Ref. No. 402.)

A British subject resident in Funchal wishes to get into touch with British exporters of cement, tinplates, etc., with a view to acting as their representative. (Ref. No. 405.)

South Africa.

The South African Railway Administration are calling for tenders for the supply of disinfectant fluid during the period January 1, 1924, to June 30, 1924. (Ref. No. 12,337 E.D./C.C. (2).)

The South African Railway and Harbours are calling for tenders, to be presented by November 12, 1923, for the supply of red oxide paint in paste during the period January 1 to June 30, 1924. (Ref. 12,338/E.D./C.C./2).

The Rand Water Board are calling for tenders (Contract No. 249) for the supply and delivery of 150 short tons—or, alternatively, 300 short tons—aluminium sulphate or aluminoferric on or before November 9, 1923. (Ref. 12,342/E.D./C.C./2).

NEW COMPANIES.

Leicester Paper Staining Company, Ltd. — Private company. Capital £5,000. Office: The Mills, Birstall, Leics.

Linium Products Synd., Ltd.—Private company. Capital £6,000., £1. shares (5,990 ordinary and 10 founders'). To acquire any invention relating to cellulose or products therefrom, etc. Office: 20, Fletcher Gate, Nottingham.

Marsdens (Clayton), Ltd.—Private company. Capital £40,000. Dyers and finishers, etc. Office: Clayton Lane, Clayton, near Manchester.

Robert Rigby, Ltd.—Private company. Capital £30,000., £1. shares (10,000 6 per cent. cumulative preference). Manufacturers of non-ferrous metals, etc. Office: New John Street Metal Works, Birmingham.

Warren Row Whiting Works, Ltd.—Private company. Capital £3,000., in £1. shares (2,700 A. and 300 B.). Office: Warren Row, Henley-on-Thames.

Samuel Ward and Co., Ltd.—Private company. Capital £25,000., £1. shares (15,000 6 per cent. cumulative preference). Manufacturers and merchants of paints, varnishes, etc. Office: 30 and 32, Great Guildford Street, Southwark, London, S.E.

Wyld, Crowther and Barrow, Ltd.—Private company. Capital £4,000. Manufacturing chemists, druggists, etc. Office: Lyons Road, Trafford Park, Manchester.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

October 1 to 6 (inclusive).

Manufacture of Table Salt in Conjunction with Electrolysis of salt Solutions. Angel, E. G. R. 24,911.
Electrolytic Cells with Mercury Electrodes. Beilby, G. T 24,566.
Temperature-sensitive Devices. Bishop, H. S. 24,605.
Controlling Flow of Liquid in Pipe Lines. Blakeborough, R. A. 24,657.
Rotary Drying-apparatus. Bodman, W. L.; and Gettings, S. S. 24,850.
Mixing-apparatus. Bodman, W. L.; and Gettings, S. S. 24,851.
Apparatus for Making Emulsions. Boothroyd, H. T.; and Dance, H. E. 24,803.
Insulating-material. British Thomson-Houston Co., Ltd. (*General Electric Co.*). 24,613.
Making Drying Oils from Mineral Oils. Calderwood, W.; Reihl, C. A.; and Webb, A. E. 24,853.
Removal of Impurities from Manganese Ores. Dutt, W. 24,558.
Silicio Acid Gels. Farbenfabriken vorm. F. Bayer and Co. 24,495.
Heating Carbon-dioxide Gas Flasks. Ferguson and Timpson, Ltd.; and Timpson, F. M. 24,590.
Quick-drying solutions. Frew, H. K.; and Wilkins and Co., Ltd., D. 24,811.
Alumina and Glass-making Salts. Frink, R. L. 24,711.
Fire-bricks. Gibbs, F. 24,692.
Water Gas Manufacture. Glasgow, A. G. 24,778.
Carburetted Water Gas. Glasgow, A. G. 24,833.
Bunsen Burners. Graham, W. A. 24,822.
Retarding Oxidisation in Gums and Resins. King, E. H.; and Wright, C. H. 24,367.
Disintegrating Artificial Fertilisers. Malmsten, N. K. E. 24,403.
Low-temperature Fuel distillation. Merz and McLellan; and Weeks, E. G. 24,632.
Magnesia Hydrate. Monterumci, R. 24,477.
Oxidising Materials. Moseley, J. F. 24,342.
Sewage Purification. Perry, G. E. 24,377.
Casein Solid. Polden, D. C. 24,573.
Hypochlorite Compositions. Rushen, P. C. (*Mathieson Alkali Works, Inc.*). 24,387.
Quinizarine. Scottish Dyes, Ltd.; and Thomas, J. 24,609.
Gasification of Coke Breeze. Wollaston, T. R. 24,440.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. *in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.*

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Waterproofing Paper. A. T. Masterman, Wooburn Green, Buckinghamshire. British Patent, **202,432**, of 1922.

In waterproofing paper by the addition to the pulp of an emulsion of resin, soap and wax, subsequently precipitated on the fibres by alum, the materials are retained in the emulsified condition and a harder and more waterproof product obtained by the addition of a polymerising agent—*e.g.*, formaldehyde, tannic acid, an alkaline solution of potassium permanganate, chromic acid, etc. Oil may be added to the emulsion and a small quantity of a water-soluble colloid—*e.g.*, glue, gum, alkali-casein, etc. The temperature of the pulp is maintained throughout the operation above the melting-point of the waterproofing agent employed.

Refining Hydrocarbons with Acid Sulphates. Plauson's (Parent Company), Ltd., London. (H. Plauson, Hamburg, Germany.) British Patent, **202,422**, of 1922.

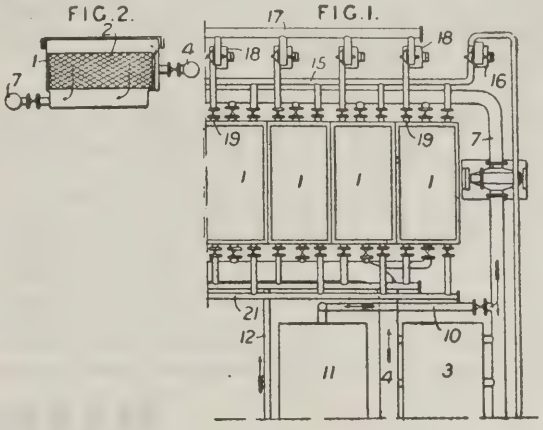
In the purification of petroleum, benzine, solar oil, paraffin, ceresin, ozokerite, montan wax, and the like saturated hydrocarbons by acid sulphate, alkali bi-sulphate or pyrosulphate, free from or containing only a little sulphuric acid, is heated with the oil, as for example to 110-250° C. and may be under pressure, 0.1-0.5 per cent. of acid phosphate or of nitric or nitrous acid or nitrates or nitrites may be added to accelerate the reaction. The treated oil may be distilled under atmospheric or reduced pressure or in a current of superheated air or steam or of carbon dioxide or other inert gas, and bisulphate may be prepared by water-extracting alkali sulphate from the still residue and treating it with sulphuric acid obtained by oxidising the sulphur dioxide evolved during the reaction.

Retorts. H. G. C. Fairweather, London. (Air Reduction Company, Inc., New York, U.S.A.). British Patent, **202,382**, of 1922.

The employment of a retort made of iron or other ferrous metal, which is desirable in various processes such as the manufacture of coal gas, oil gases, and in certain processes for the fixation of atmospheric nitrogen, is rendered possible by giving it an integral external protective coating of a refractory base metal alloy which is applied by spraying. Such an alloy may consist of 85 per cent. nickel and 10-15 per cent. chromium or 50-60 per cent. nickel, 10-20 per cent. chromium and 10-30 per cent. iron.

Dry Distillation. I. Moscicki, Lwow, Poland. British Patent, **202,333**, of 1922.

In the dry distillation of bituminous or cellulose containing materials the distillation products are circulated continuously from a series of distilling chambers through a condenser and superheater and back to the distilling chambers, the surplus products being drawn off. Sheet iron distillation chambers 1 each contains a perforated metal fuel holder 2 which is lifted out of the chamber when recharging is necessary, the heating gases from the superheater 3 entering by pipe 4 and leaving by pipe 7 to be returned to a condenser 11 and the superheater. The condenser may be omitted from the heating circuit and used for cooling the surplus gases and vapours only which enter it by a pipe 10



and pass through it to a gasometer. According to one method of working in five of the chambers 1 distillation is taking place by means of the superheated gases, two chambers are being cooled by the passage of gas injected from pipe 17 by fans 18, this gas being thereby heated and passed into a collecting pipe 21, from which it is led into two freshly charged chambers, the charges in which are heated and dried. The gases and vapours are returned through valves 19 to the exposed cooling pipe 17 in which steam is condensed. Air is displaced from the freshly charged chambers by gas from a pipe 12, the mixture of air and gas being delivered from pipe 15 by a pump 16 to the combustion chamber of the superheater. The remaining chamber is being re-charged. The superheated gases may, however, be passed through a number of the chambers in series. Specification 12508/99 is referred to.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Hydrocarbon Polymerisation with Aluminium Chloride. Soc. Ricard, Allenet et Cie, Melle, Deux-Sèvres, France. British Patent, **202,311**. Convention date, August 9, 1922.

Gaseous ethylenic hydrocarbons are polymerised to liquid hydrocarbon mixtures of indeterminate boiling point by passing them into a suspension of anhydrous aluminium chloride in petroleum ether. The gases should be pure and dry; it is advantageous to work under pressure. The first product is a viscous liquid compound of the aluminium chloride and hydrocarbon, and probably serves as the catalyst for the subsequent polymerisation of more hydrocarbon to a more mobile product. It is advantageous first to pass butylene through the catalyst suspension when ethylene is to be polymerised. The reaction product is treated with water to decompose the aluminium-chloride compound, and rectified for recovery of the petroleum ether; portions of the reaction liquid may also be drawn off at intervals and so treated, more gases being passed through the remainder. The products still contain double bonds and may be hydrogenised by the usual methods; they may also be cracked to obtain products of lower boiling-point. Examples are given of the polymerisation of butylene at ordinary pressure, and of ethylene at a pressure of 3 kg. per sq. cm. Specification 165,452 is referred to.

Vat Dyestuff Derivatives. Durand and Huguenin Akt.-Ges., Basle, Switzerland. (Assignees of M. Bader and C. Sunder, Mulhouse, Haut-Rhin, France.) British Patents, **202,630** and **202,632.** Convention dates, August 21, 1922. Additions to 186,057

In the process described in the parent Specification for the production of ethereal salts of leuco vat-dyes by the action of chlorsulphonic acid upon the said leuco compounds in presence of a tertiary base, and with or without a diluent, a salt of chlorsulphonic acid such as the sodium salt is substituted for the free acid. In an example leuco indigo is treated with sodium chlorsulphonate in presence of dimethylaniline and chlorbenzene and in an atmosphere of carbon dioxide.—The chlorsulphonic acid or chlorsulphonate employed is replaced by fuming sulphuric acid or sulphuric anhydride. Examples are given in which leuco indigo is treated with fuming sulphuric acid, or sulphuric anhydride, in presence of dimethylaniline and chlorbenzene, air being excluded.

Colloidal Sulphur. H. Vogel, Premnitz, Westhavelland, Germany. British Patent, **202,613.** Convention date, August 16. 1922.

Highly dispersed sulphur hydrosols are obtained by introducing sulphur dioxide and sulphuretted hydrogen into water in as fine a distribution as possible and preferably while agitating, the reaction vessel being maintained at a low temperature, for example −3 to +4° C. The degree of dispersion and the concentration obtainable increase with decrease in reaction temperature. Excess of sulphuretted hydrogen serves to increase the yield and to diminish the formation of polythionic acids. The dispersions obtained may be kept in closed receptacles to avoid oxidation. In an example, one of the usual protective colloids is added to the water.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—"Uncertain" sums up the general tone in this market, and, due to this position, buyers show no confidence in placing orders of any size, continuing their policy of hand-to-mouth supplies. The trend of the market here depends a good deal on developments in Germany, but so far there are only indications of either a shortage of supplies to offer and at dearer prices. For this reason many spot holders are holding up their prices. **Acetic Acid,** 80% technical, about £47.; 80% pure, about £48.; 98% glacial, about £60. in casks and about £72. in glass demijohns, ex wharf London; the spot position seems a shade easier again this week, and some opinions favour still cheaper prices to come along. **Acetone,** British Government specification, about £124. per ton; the spot position shows no change on the week, with the market quite steady. **Alum,** lump, in casks, about £10. to £10. 10s. per ton, on spot; dealers continue to offer Continental material at about these figures, with not much business passing. **Arsenic,** Cornish, white powdered, spot, about £63. 10s.; f.o.r. Cornwall, about £57. 10s.; foreign material, c.i.f. to arrive, about £61. 10s. per ton; plenty of inquiry on the market from America. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. to 1s. 5½d. per lb.; dealers continue to quote at these rates, with some little business being done. **Bleaching Powder,** 35—37%, on spot, about £10. to £10. 10s. per ton; Continental offers are at about £9. per ton; business remains slow. **Barium Chloride,** 98—100%, about £15. per ton; the spot position keeps steady, with a little business being done. **Borax,** commercial, granulated £24. 10s., crystals £25., powdered £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices for home trade show no change; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered at £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers continue to quote at these prices for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices, for home trade only, show no change; dealers are offering at competitive rates. **Citric Acid,** B.P., crystals, about 1s. 4½d. per lb., less 5%; the spot position remains weak, with little business doing; values as quoted are very easy. **Cream of Tartar,** 99—100%, about 85s. per cwt.; a slight reduction in price for spot material is recorded, with market quiet. **Epsom Salts,** commercial quality, about £4. 10s. per ton, in bags; dealers are offering Continental material at about these figures. **Formaldehyde,** 40%, about £63. per ton; the spot position is again at easier values, and, with business rather slow, the market is none too steady. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers offering at these prices find business on the slow side. **Lead Acetate,** brown, about £41. to £41. 10s.; white, about £42. per ton; supplies on spot seem small, and Continental offerings are dearer. **Litharge,** about £35. 10s. per ton; importers' offers are steady at this unchanged level, with some limited business being done. **Lithopone,** 30% Continental red seal, £22. 10s. to £23. per ton; the spot position tends to firm up to the higher figure quoted; Continental offers are firmer; inquiry good on spot. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; dealers holding spot stocks are firm at these rates, with not much available; Continental position is firmer. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these prices. **Oxalic Acid,** 6d. per lb.; the lack of business is still very noticeable here, and quoted prices are unchanged. **Carbonate of Potash,** 90—92%, £26. to £27.; 96—98%, about £29. per ton; spot supplies seem rather limited, and, with Continental rates dearer, the prices quoted appear quite steady. **Chlorate of Potash,** crystals and granular, about 2¾d. per lb.; quoted rates are unchanged, with inquiry small. **Caustic Potash,** 88—92%, about £31. per ton, on spot; this price is fully maintained, and tends to firm up a little; supplies are not very plentiful; Con-

tinental offers are dearer. **Permanganate of Potash,** commercial quality, about 9d. per lb.; this market has been dull, with quoted values unchanged. **Prussiate of Potash,** yellow, about 11d. per lb.; dealers have made a further reduction in their prices, but there has been no improvement in demand. **Sulphate of Potash,** 90%, about £11. per ton, ex ship; the market seems steadier after last week's reduction in price. **Mercury,** about £9. 15s. to £10. per bottle of 75—76lb., net; dealers are offering on spot at about these prices. **Red Lead,** imported, about £35. 10s. per ton; imported material is moving off fairly well at about this figure. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white crystals, £25. to £26. per ton; the spot market keeps very steady at these rates, and are likely to advance, in view of the firmer conditions on the Continent. **Saltcake,** ground and unground, home trade, about £4. 10s. per ton; the market keeps very steady, with plenty of inquiry about. **Acetate of Soda,** about £24. 15s. per ton, on spot; dealers are offering at this price, with not much doing. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 17s. 6d. per ton, in drums, ex wharf shipping port; dealers continue to quote at these prices, with business slow. British makers' prices are at: 70—72%, £17. 17s. 6d.; and 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid in Great Britain, to home consumers only on contract; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags, carriage paid in Great Britain; British makers' prices, for home trade only, are unchanged. **Bichromate of Soda,** home trade, 4½d. per lb., carriage paid; British makers' prices are level on the week. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers continue to offer at these prices. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags, carriage paid in Great Britain; British makers quoting at this figure for home trade only; spot parcels ex store at about same figure. **Hyposulphite of Soda,** pea crystals, about £14. 5s. to £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £9. 10s. to £10. per ton, in casks; the spot position is firmer, with Continental offers dearer. **Nitrate of Soda,** about £13. 5s. per ton, f.o.r. or f.o.b.; the position shows no change on the week, with the market steady. **Nitrite of Soda,** 100%, about £26. 10s. per ton; the quoted price is about the same, with the market dull. **Prussiate of Soda,** about 6d. per lb.; at the quoted rate given the market is rather weak, and has again been quiet. **Sodium Sulphide,** 60—62% solid, about £14. per ton; ditto, broken, about £15. per ton; 60—65% concentrated, about £14. per ton, in casks. **Sulphate of Copper,** about £25. 10s. per ton, less 5% for home or export, delivered and f.o.b. respectively; British makers quote at about these prices. **Tin Crystals,** 1s. 4d. per lb.; the market shows no change on the week. **Tartaric Acid,** B.P., crystals, on spot, 1s. 1½d. per lb., less 5%; business shows no improvement, and with heavy stocks offering the market as quoted is certainly weak. **White Lead,** imported, about £42. per ton; dealers continue to do a little business at about this figure. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers report their prices are unchanged.

Pharmaceutical Chemicals.—The spot position, as forecasted last week, is on a generally higher level as regards quoted prices this week. This movement is clearly due to the position in Germany, where, owing to extremely high costs of raw materials, many makers are standing off temporarily, and the few producing are forced to ask much higher values. **Acetanilid,** crystals and powder, 1s. 9½d. to 1s. 10d. per lb.; prices for spot material are again a shade firmer, with inquiry good. **Acetyl-Salicylic Acid,** B.P., 3s. 1½d. to 3s. 3d. per lb.; the spot position is again at higher rates, with the market firm; supplies limited. **Benzoic Acid,** B.P., 2s. 3d. to 2s. 6d. per lb.; dealers quote at these rates, with very little doing. **Diethylbarbituric acid,** B.P. (barbitone), about 18s. per lb.; the firmer tone reported last week is fully maintained. **Salicylic Acid,** B.P., 2s. 3d. to 2s. 4d. per lb.; dealers holding spot stocks quote firmly at these rates, with business fair. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; this market has been rather quiet during the week, and dealers' prices are unchanged. **Amidopyrin,** about 14s. 6d. per lb.; although business is still slow, spot quotations are quite steady. **Ammonium Bromide,** 7d. to 8d. per lb.; owing to the dearer offers from the Continent, the spot position is a little steadier at the rates quoted. **Benzonaphthol,** about 5s. per lb.; the market remains dull, with quoted values unchanged. **Betanaphthol,** resublimed, 1s. 10d. per lb.; there is seldom any inquiry for this article. **Benzaldehyde 03,** about 3s. per lb.; this item keeps steady on a dull market. **Calcium Lactate,** 1s. 9d. per lb.; the tendency here is to slightly higher prices. **Chloral Hydrate,** duty paid, 3s. 11d. to 4s. 1d. per lb.; the demand has not been much, but the market is very steady. **Creosote,** B.P., about 2s. 6d. per lb.; the market keeps steady, but has again been dull. **Creosote Carbonate,** about 8s. 6d. per lb.; prices are slightly firmer, with business lacking. **Guaiacol Carbonate,** about 10s. per lb.; this higher price is fully maintained. **Hexamine,** 4s. to 4s. 1d. per lb.; still further advances in prices are recorded, with quotations from the Continent moving in the same direction. **Hydroquinone,** 3s. 4d. to 3s. 6d. per lb.; prices for spot goods are a shade easier this week, with little demand about. **Methyl Salicylate,** 2s. 8½d. to 2s. 10d. per lb.; the firmer tone reported last week is fully maintained. **Methyl Sulphonal,** about 15s. per lb.; market remains dull, with quoted rates unchanged and steady. **Paraformaldehyde,** 3s. 6d. to 3s. 9d. per lb.; this item is very steady, and a fair business continues. **Paraldehyde,** 1s. 5d. to 1s. 6d. per lb.; these recently improved prices are being maintained, with a little business doing. **Phenacetin,** 6s. 2d. to 6s. 3d. per lb.; offers of spot parcels are at about these rates, with a tendency to advance. **Phenazone,** 7s. 6d. to 7s. 9d. per lb.; 7s. 9d. to 8s. per lb.; the movement to dearer prices continues, with plenty of inquiry on spot. **Phenolphthalein,** 7s. to 7s. 3d. per lb.; a sharp advance in prices is recorded. **Potassium Bromide,** B.P., crystals and granular, 6¼d. to 6¾d. per lb.; the spot position is inclined to be steadier, although business is still slow; Continental prices are dearer. **Potassium Permanganate,** B.P., 9½d. to 10d. per lb.; prices tend to move to higher rates, with plenty of inquiry on spot. **Potassium Sulphoguaiacolate,** about 5s. 9d. to 6s. per lb.; dealers holding spot stocks are quoting at these higher rates. **Resorcin,** about 5s. 6d. per lb.; at this level the spot market is quite steady. **Sodium Bromide,** B.P., crystals and granular, 7d. to 7¾d. per lb.; prices are somewhat steadier, and tend to harden a little. **Sodium Salicylate,** B.P., crystals, 2s. 9d. to 2s. 10d.; powder, 2s. 8d. to 2s. 9d. per lb.; spot prices quoted at much higher rates this week, with Continental offers also dearer. **Sulphonal,** about 14s. 6d. per lb.; hardly any inquiry; quoted rates unchanged. **Terpin Hydrate,** about 1s. 9d. per lb.; this market shows no change on the week. **Thymol,** about 15s. per lb.; inquiry is infrequent, and prices mentioned are unaltered. **Vanillin,** 100%, 23s. 3d. to 23s. 6d. per lb.; spot offers at these levels.

Coal-tar Products, Intermediates, Etc.—This market shows hardly any change during the past week. Business has been small and slow. Pitch keeps steady. Benzol is weak. Naphthas are dull. **Aniline Oil,** about 9d. per lb., drums free; this item shows little life, and values are a shade easier. **Aniline Salt,** about 9½d. per lb., casks free; there has been but little inquiry during the week; quoted values easy. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; this market remains rather quiet, with values as quoted easy. **Benzol,** about 1s. 3½d. to 1s. 4d per gallon, f.o.r. makers' works, in buyers' packages; this item has been dull, and a slight reduction in price might be anticipated before long. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; quoted rates show no change, with business small and slow. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; dealers are offering at these levels, with little doing. **Naphtha,** about 1s. 4d. per gallon; this price is still quoted, but the market looks like weakening a little. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; inquiry has again been poor, and quoted rates are easy. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; dealers are offering at about this figure, with little business about. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; unchanged rates govern this market, which has been quiet for some time. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; there is no change to record here; market quiet but steady. **Creosote Oil,** about 9¼d. to 9½d. per gallon, f.o.b.; the demand has shown no improvement during the week, and prices are perhaps a shade easier. **Carbolic Acid,** crystals, about 1s. 2d. per lb., f.o.b.; at this rate the market keeps fairly steady, but there has been little business doing. **Naphthalene,** about £19. 10s. to £20. per ton; this market is steadier; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; candles, £28.; tablets, £28. per ton, packages free. **Disin-**

fectants, 3s. 9d. per gallon, barrels free; the market is level on the week, with business slow. **Pyridine,** about 21s. per gallon; the spot position keeps very firm. **Hexamethylene,** 3s. 9d. to 3s. 10d. per gallon; the advance in price recorded last week is being fully maintained on spot. **Pure Methyl Alcohol,** about £90. per ton, in drums, ex wharf London; dealers quoted prices are well up to this figure, with a fair inquiry being dealt with. **Pitch,** about 137s. 6d. per ton, f.o.b. East Coast; the better price recorded last week is being maintained on a steady market, with a fair inquiry continuing.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £60. 17s. 6d., cash; £61. 12s. 6d. to £61. 15s., three months; electrolytic, £64. to £65. **Tin:** Standard, £202. 17s. 6d. to £203., cash; £200. 10s. to £200. 15s., three months; Straits, £203. 17s. 6d.; English, £204. **Lead,** soft foreign, £28., prompt; English, £29.; chemical sheet, 36s. 6d. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 10s.; hard, £28. **Antimony,** English regulus, 99%, £28. 5s. to £29. 10s.; special brands, £34 10s. to £35. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £9. 5s. **Bismuth,** 10s. **Platinum,** 500s. per oz. **Wolfram,** spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

Business continues dull and uninteresting, with few changes in values to record. Buyers are only placing orders for near requirements, and there is very little inquiry forward. Quotations for alkali products are unchanged. **Caustic Soda,** 70%, £17. 17s. 6d.; **58% Alkali,** £7. 10s.; **Soda Crystals,** £5. 5s., carriage paid. **Bicarbonate of Soda,** £10. 10s., on rails. **Roasted Saltcake,** quiet at £4. 10s., carriage paid. **Bleaching Powder,** softwood casks, easy at £11. 5s. on rails. **Chlorates** in only small demand at 2¾d. and 3d. per lb. for **Soda** and **Potash** respectively. **Bichromates** unaltered. **Copper Sulphate** continues in small demand, and quotations remain nominal at £26., f.o.b. Liverpool. American **Sulphur** is firmly held at £5. 5s. per ton, ex store. **Phosphate** and **Commercial Hyposulphite of Soda** are only moving off slowly, and prices show no improvement. **Nitrite of Soda,** firm at £26. 10s., ex store. **Concentrated Sodium Sulphide,** quiet at £14. per ton, carriage paid. White powdered Cornish **Arsenic** is freely offered at £60., on rails works, but the demand is slow. **Yellow Prussiate of Potash** is firm at 1s. per lb.; **Soda,** 5½d. to 5¾d. per lb., both carriage paid. **Carbonate of Potash,** 90%, easier at £24. **Solid Caustic,** 88—90%, maintained at £29. per ton, c.i.f. **Acetic Acid** and **Acetate of Soda** are steady at recent rates. Grey and brown **Acetate of Lime** continue scarce, and quotations are firm. **Acetone,** dull at £125. per ton. **Miscible Wood Naphtha,** 6s. 3d. per gallon. **Lead Salts** have an upward tendency. White **Acetate** £41. 10s., brown £45., both carriage paid. **Lead Nitrate,** unaltered at £42. **Barium Chloride,** steady at £14. 10s. to £15., on rails makers' works. **Green Copperas** is in better request, but prices show no improvement. **Oxalic Acid,** dull at 5¾d. per lb., ex store. **Permanganate of Potash,** B.P., firm at 9¼d. per lb.

SWANSEA MARKET REPORT. Wednesday.

Tinplate quotations continue firm on the basis of £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** show further strength, and prices are firm at £19. 2s. 6d. per ton for 24-gauge sheets, f.o.b. **Copper** easier, with prompt at £60. 12s. 6d. per ton, and three months £61. 7s. 6d. **Tin,** moderate business without special feature, and somewhat irregular quotations, with prompt £201. 17s. 6d., and three months £200. 2s. 6d. per ton. **Lead** fairly steady, with foreign softs at £26. 7s. 6d. cash, and £26. 10s. three months; English, £28. 7s. 6d. **Spelter** less active, with business holding off; prompt £32. 7s. 6d., and forward £31. 12s. 6d. **Zinc Sheets,** in fair demand at £39. 7s. 6d. per ton, on rail at works. **Rape Oil** firm; best refined, £2. 6s. 3d. per cwt., net, in barrels. **Cod Oil** steady; Newfoundland, £2. 5s. 3d. per cwt.; English, £1. 15s. 9d. per cwt., f.o.b. **Seed Oils** very firm: **Cottonseed,** common edible £2. 3s. 3d. per cwt., and deodorised £2. 6s. 3d., net, in barrels. **Linseed,** rather quiet, with prompt raw £2. 6s. 6d., and boiled £2. 8s. 6d. per cwt., in barrels. **Olive Oil,** scarce and dearer at £41. 2s. 6d. per ton, ex ship. **Coconut Oil** very quiet, with Ceylon at £2. 4s. 6d. per cwt., ex ship. **Castor Oil** firm, with best grades at £2. 18s. 3d., and common £2. 10s. 3d., net, per cwt., in barrels. **Turpentine,** quiet at £3. 15s. 9d. per cwt. for American refined. **Oxalic Acid,** very quiet at 6¼d. per lb., f.o.r. Swansea. **Pitch** firmer, but little business transacted at £6. 2s. 6d. per ton for best grades. **Copperas,** dull at £2. 2s. 6d. per ton, including delivery London or equal. **Arsenic** met with better inquiry, with easier quotations at £60. 17s. 6d. per ton for white powdered. **Palm Oil** was very firm: Lagos, £36. 15s. 6d.; softs, £36. 2s. 6d. prompt, and £36.; mediums, £36. prompt and £36. 7s. 6d. forward; hards, £37. per ton. **Sulphate of Ammonia, very firm on the £14.** 12s. 6d. per ton basis. **Sulphate of Copper,** rather slow at £26. 2s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda,** very steady at 13s. 9d. per cwt., in bags, net. **Bone Meal** slow, with prompt Indian at £9. 2s. 6d. per ton. **Sulphuric Acid** sold freely at unchanged rates. **Coal** rather quiet, and, owing to unsatisfactory ship loading, buyers were able to obtain concessions: Best Admiralty smokeless £1. 1s. 6d., seconds £1. 6s. 6d.; ordinaries £1. 5s. 6d.; Monmouthshire black vein, £1. 7s., all per ton, f.o.b. **Anthracite** rather quiet; best large, £2. 7s. 6d.; cobbles, £2. 15s.; Paris and French nuts, £3. per ton, f.o.b. **Patent Fuel,** steady from £1. 8s. 9d. to £1. 11s. 6d. per ton, f.o.b. **Cokes** were again firmly held at £2. 2s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, on rail at ovens.

LIVERPOOL CHEMICAL MARKET. Wednesday.

The demand for chemicals of the heavier class has been fairly maintained for home-trade requirements. In the export branch orders have come steadily to hand to a fair extent, and shipments have been moderately active. **Bleaching Powder** has been quiet; the price of spot is £11. 5s. per ton, and the same price is quoted for export. For contracts special prices are being quoted. **Chloride of Calcium** has again had a steady inquiry, and is £5. 12s. 6d. per ton. **Caustic Soda** has been in fair request for use in the U.K., and has had a rather active shipment for foreign ports; spot is £19. 7s. 6d. per ton for 76%; for contracts special prices are being quoted. **Bicarbonate of Soda** for home-trade use has again been in very fair demand, and is £10. 10s. per ton, carriage paid; shipments to overseas ports have been on a large scale. **Soda Crystals** continue in good demand for use in the U.K., and are £5. 5s. per ton, carriage paid. **Nitrate of Soda** has moved but slowly, and is £13. 5s. to £13. 10s. per ton. **Borax** has been rather more in demand; commercial crystals are £25. per ton, and powdered £26.; higher-grade crystals are £29. per ton, and powdered £30.; superfine is £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** has again sold with some freedom, and is £4. 10s. to £5. per ton for home-trade use, and £5. to £6. per ton for export. **Bichromate of Soda** continues to meet with a fair inquiry, and is 4¾d. per lb. to stated ports. **Ammonia Alkali** has been in good request for use in the U.K., and has been shipped largely to overseas ports; it is £7. 10s. per ton for spot, in bags, f.o.r. at works; for contracts special prices are quoted; for export the price is £8. per ton, varying somewhat according to destination. **Hyposulphite of Soda** has been quieter; it is £10. to £11. per ton, in 2cwt. bags, for commercial; and £15. to £17. per ton for the photographic quality, in 1cwt. kegs. **Sulphide of Soda** has again been in moderate demand; solid is £14. 10s. to £15. per ton, and crystals £8. 15s. to £9. per ton. **Chlorate of Soda** has had a very limited inquiry, and is 3d. to 3¼d. per lb. **Phosphate of Soda** has been but little in demand, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been in quietly steady demand, and is 6¼d. per lb. **Yellow Prussiate of Potash** has been quieter, and is 1s. 1d. per lb. **Red Prussiate** has been in moderate demand, and is 3s. per lb. **Carbonate of Potash** has been but little called for, and is £25. to £30. per ton. **Nitrate of Potash** has been rather more in demand, and is £29. to £30. per ton. **Chlorate of Potash** has been in fair request, and is 3½d. to 4d. per lb. **Caustic Potash** has been steadily called for, and is £29. to £30. per

ton. **Permanganate of Potash** has been quieter, and is 9½d. to 9¾d. per lb. **Bichromate of Potash** has been in quietly steady demand; it is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has had a very fair inquiry; first quality is £60. per ton, and second quality £57. per ton. **Sulphate of Ammonia** has been quiet both for the home trade and for export; neutral of 25¾% is £14. 12s. 6d. per ton, and ordinary of 25¼% £13. 9s. 6d. per ton, for home-trade use, for October deliveries, and 2s. 6d. per ton more for November. **Carbonate of Ammonia** has sold with some freedom, and is 4d. per lb. **Muriate of Ammonia** has been in fair demand, and is £32. per ton. **Magnesia** has been steadily called for; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has had a moderate inquiry; it is £12. per ton for use in the U.K., and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been in fair request, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been in rather good request; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s. per ton, and American £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has had a quietly steady sale, and is 1s. 2d. to 1s. 2½d. per lb. **Cream of Tartar** has been in rather good request, and is £4. 10s. per cwt. **Boric Acid** has been in very fair demand; commercial is £48. per ton, and powdered £51. per ton; B.P. grades are £54. to £60. per ton. **Citric Acid** continues very quiet, and is 1s. 6d. to 1s. 7d. per lb. **Oxalic Acid** has had a moderate inquiry, and is 6d. per lb. **White Acetate of Lead** has been rather more in demand, and is £42. to £42. 10s. per ton. **Sulphate of Copper** has been but little called for on home-trade account or for export; the price is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has had a fair inquiry, more especially on export account; quotations have varied widely; from £60. to £61. per ton may be given as the price of white powdered.

WEST OF SCOTLAND CHEMICALS.

Wednesday.

A quieter tone has been evident in the Glasgow market for chemicals, and business on home account has been of smaller dimensions. The export trade still keeps rather dull, with little inquiry. Prices are steady at previous figures, and there are no alterations of note to record. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, lower at £66. 10s. per ton on spot; a steady market. **Barium Chloride,** £14. 10s. per ton; at this price the market remains steady. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid,** 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate,** £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar,** £4. 3s. 6d. per cwt. for 99% at Glasgow; quotation steady, but inquiry small. **Lead Acetate,** white, £41. 10s. per ton on spot; brown, more inquiry at £43. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** lower at 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. 2d. per lb.; at this price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 12s. per cwt., net; a better market, with quotation unaltered. **Sodium Bichromate,** 4½d. per lb.; unchanged **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; rather easier in tone, and inclined to be dull. **Tartaric Acid,** 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

Sydney, 1 cs., £5.

AMMONIUM CARBONATE—
Antwerp, 2 t. 10 c., £68. ; Bangkok, 1 t. 10 c., £96. ; Bombay, 9 c., £53. ; Brussels, 10 c., £13. ; Calcutta, 13 c., £56. ; Demerara, 5 c., £11. ; Hamburg, 2 t., £47. ; Karachi, 1 c., £6. ; Melbourne, 3 c., £6. ; Metelin, 4 c., £13. ; Padang, 17 c., £48. ; Penang, 5 c., £12. ; Pt. Elizabeth, 4 c., £8. ; Rouen, 10 c., £15.

AMMONIUM CHLORIDE—
Bombay, 2 cs., £7.

AMMONIUM CITRATE —
Montreal, 2 cs., £25.

AMMONIUM NITRATE —
Dunkirk, 30 t. 1 c., £780.
Las Palmas, 10 t., £245.

AMMONIUM PERSULPHATE—
Beira, 4 cs., £56.

AMMONIUM PHOSPHATE—
Aarhus, 15 cks., £105.

AMMONIUM SULPHATE—
Antwerp, 975 t., £14,625. ; Calcutta, 62 t., £899. ; Hong Kong, 100 t., £1,540. ; Kudat, 11 t. 18 c., £171. ; Las Palmas, 30 t. 10 c., £441. ; Mauritius, 250 t., £3,781.

ANTIMONY SULPHIDE—
Brussels, 4 pkgs., £39.
New York, 7 cks., £138.
Trelleborgs, 5 cks., £47.

ARSENIC—
Abo, 20 cs., £60. ; Durban, 200 drms., £616. ; Delagoa Bay, 1 drm., £6. ; Rotterdam (F.), 48 cs., £150. ; San Paulo, 80 drms., £355.

BARIUM SULPHATE (BLANC FIXE)—
Sydney, 20 bgs., £17.

BARIUM SULPHIDE—
Barcelona, 1 ck., £22.

BENZOIC ACID—
New York, 3 cs., £87.

BISMUTH CARBONATE—
Bombay, 1 cs., £71. ; Calcutta, 1 cs., £71. ; Montreal, 1 cs., £92. ; Sydney, 3 cs., £287.

BISMUTH SALICYLATE—
Aarhus, 9 pkgs. (pt.), £41.

BISMUTH SALTS (*otherwise undes.*)
Perth, 3 pkgs. (pt.), £9.

BISMUTH SUBNITRATE —
Athens, 1 cs., £31.
Aarhus, 9 pkgs. (pt.), £42.
Bombay, 5 cs., £299.
Calcutta, 3 cs., £181.;
Colombo, 1 cs. (pt.), £8.
Sydney, 1 cs., £125.

BISMUTH TRIBROMPHENOLATE
Aarhus, 9 pkgs. (pt.), £21.

BITUMEN—
Calcutta, 17 brls., £34.
Karachi, 57 pkgs., £112.
Melbourne, 18 cks., £60.

BLEACHING POWDER—
Malta, 36 pkgs. (pt.) £44.

BONE MEAL—
Antwerp, 5 t., £50.
Channel Islands, 5 t., £40.

BORAX—
Antwerp (F.), 30 t., £735. ; Beira, 5 c., £14. ; Danzig (F.), 10 t., £245. ; Delagoa Bay, 2 c., £5.

BORAX—
Durban, 4 c., £10
Lisbon, 3 t. (F.), £78.

BORIC ACID—
Bangkok, 6 c., £20. ; Bombay, 6 c., £35. ; Calcutta, 19 c., £52. ; Launceston, 2 c., £5. ; Malta, 2 c., £7. ; Pt. Elizabeth, 4 c., £12. ; Pt. Swettenham, 2 c., £7.

CALCIUM CARBIDE—
Beira (F.), 7 c., £14.
Channel Islands (F.), 1 t. 12 c., £26.

CALCIUM HYPOPHOSPHITE—
Calcutta, 1 cs., £14.
Kobe, 10 cs., £138.

CARBON TETRACHLORIDE—
Sydney, 3 drms., £49.

CAUSTIC SODA—
Buenos Ayres, 1 c., £7. ; Haifa, 10 c., £26. ; Hong Kong, 2 c., £9. ; Shanghai, 9 c., £40.

CHEMICALS (*otherwise undescribed*)
Aarhus, 18 pkgs. (pt.), £15. ; Ahwaz, 4 cs., £13. ; Auckland, 50 pkgs., £77. ; Beira, 70 pkgs., £249. ; Benguella, 4 pkgs., £5. ; Bombay, 17 cs. (pt.), £78. ; Buenos Ayres, 150 pkgs., £1,290. ; Calcutta, 8 cs. (pt.), £47. ; Cape Town (F.), 1 cs., £7. ; Cape Town, 2 pkgs. (pt.), £17. ; Colombo, 1 cs., £21. ; Delagoa Bay, 200 pkgs., £710. ; Durban, 6 pkgs. (pt.), £12. ; East London, 10 cs., £20. ; Fremantle, 8 cs., £18. ; Gothenburg, 15 pkgs., £39. ; Hamburg, 100 pkgs., £244. ; Hong Kong, 4 bgs., £6. ; Irish Free State, 2 pkgs., £6. ; Launceston, 13 pkgs. (pt.), £157. ; Madras, 2 cs., £5. ; Malta, 72 pkgs. (pt.), £62. ; Melbourne, 14 cs. (pt.), £74. ; New York, 4 cs. (pt.), £88. ; Paris, 1 cs., £11. ; Penang, 7 pkgs., £190. ; Perth, 2 pkgs. (pt.), £56. ; Pt. Elizabeth, 1 cs., £12. ; Pt. Said, 3 cs. (pt.), £6. ; Pt. Swettenham, 8 pkgs., £13. ; Rotterdam, 32 pkgs., £157. ; Rotterdam (F.), 48 pkgs., £239. ; Shanghai, 5 cs., £18. ; Singapore, 36 pkgs. (pt.), £94. ; Sydney (F.), 5 cs., £16. ; Sydney, 55 pkgs., £1,312. ; Valparaiso, 2 cs., £17. ; Wanganui, 20 pkgs., £26. ; Wellington, 3 cs., £77.

COAL TAR PRODUCTS—
Carbolic Acid
Colombo, 1 cs., £5.
Creosote
Galveston (bulk), 40,807 galls., Sydney, 1 cs., £8.
Mirbane Oil
Singapore, 2 pkgs., £26.
Naphthalene
Antwerp, 400 bgs., £420.
Rotterdam, 1,000 bgs., £1,413.
Pitch
Alexandria, 130 brls., £265. ; Antwerp (bulk), 330 t., £2,028. ; Dunkirk (bulk), 250 t., £1,596. ; France (bulk), 840 t., £5,366.
Pyridine
Calcutta, 20 drms., £105.
Rotterdam, 11 drms., £260.
Tar
Beira, 100 drms., £31. ; Delagoa Bay, 162 drms., £31. ; Durban, 52 pkgs., £11. ; East London, 55 cks., £11. ; Limon (C.R.), 5 cs., £7. ; Mozambique, 10 brls., £22. ; Seychelles, 25 drms., £5. ; Singapore, 30 drms., £32.

CITRIC ACID—
Amsterdam (F.), 1 t. 2 c., £187. ; Barbados, 1 c., £10. ; Calcutta, 6 c., £47. ; East London, 2 c., £15. ; Fremantle, 3 c., £27. ; Jamaica, 2 c., £16. ; Melbourne, 10 c., £91. ; Rotterdam, 9 c., £85.

COBALT ACETATE—
Amsterdam, 1 cs., £14.

COBALT OXIDE—
Brussels, 4 cs., £180.
Helsingfors, 1 cs., £55.
Melbourne, 1 cs., £22.

COBALT SULPHATE—
Sydney, 1 ck., £36.

COPPER SUBOXIDE—
Wellington, 3 drms., £33.

COPPER SULPHATE—
Delagoa Bay, 4 c., £7.
Durban, 5 c., £7.
East London, 9 c., £15.
Pt. Elizabeh, 17 c., £29.

CREAM OF TARTAR—
Concepcion, 1 c., £6. ; Delagoa Bay (F.), 7 c., £48. ; Durban (F.), 6 c., £41. ; Durban, 1 c., £6. ; East London, 1 c., £6. ; Fremantle, 15 c., £89. ; Madras (F.), 1 c., £6. ; Pt. Elizabeth, 5 c., £24.

DISINFECTANTS (*otherwise undes.*)
Acajutla, 2 t. 6 c., £83. ; Alexandria, 2 c., £12. ; Auckland, 1 t. 15 c., £125. ; Barbados, 1 t., £22. ; Beira, 6 c., £102. ; Bombay, 18 c., £37. ; Canton, 3 c., £23. ; Cape Town, 1 t. 9 c., £27. ; Christchurch, 2 t. 15 c., £683. ; Colombo, 5 c., £19. ; Dar-es-Salaam, 5 c., £10. ; Delagoa Bay, 1 t. 5 c., £60. ; Demerara, 2 t. 9 c., £54. ; Durban, 2 t., £92. ; Karachi, 2 t. 6 c., £71. ; La Libertad, 18 c., £33. ; Linde, 1 t. 6 c., £39. ; Malta, 2 c., £5. ; Penang, 2 t. 17 c., £94. ; Pt. Elizabeth, 4 c., £37. ; Pt. Moresby, 1 c., £7. ; Pt. Swettenham, 7 c., £108. ; Singapore, 2 t. 7 c., £76. ; Swatow, 15 c., £91. ; Tanga, 2 c., £6. ; Trinidad, 2 t. 17 c., £61. ; Wanganui, 1 c., £18. ; Wellington, 2 t. 4 c., £153.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 170 kgs., £1,080.
Jamaica (F.), 1 kg., £99.
Nigrosine Base
Brussels, 1 ck., £25.
Unspecified
Bombay, 9 cs. (pt.), £31. ; Brisbane, 1 cs., £11. ; Cape Town, 1 cs., £14. ; Jamaica, 1 cs. (pt.), £13. ; Melbourne, 5 pkgs. (pt.), £154. ; New York, 2 cs. (pt.), £21. ; Ostend, 4 pkgs., £30. ; Singapore, 1 cs., £8.

ETHER—
Adelaide, 10 cs., £32. ; Canton, 1 cs., £7. ; Pt. Elizabeth, 1 cs., £7. ; Salamanca, 1 cs., £9. ; Shanghai, 5 cs., £11. ; Sydney, 2 cs., £8. ; Trinidad, 2 cs., £6.

ETHYL CHLORIDE—
Durban, 2 cs., £15.
East London, 2 cs., £24.
Sydney, 1 cs. (pt.), £6.

FERTILISERS (*otherwise undes.*)—
Aarhus, 10 c., £13.
Barcelona, 12 c., £8.
Channel Islands, 4 t., £42.

FORMALDEHYDE—
Malta (F.), 8 cs. (pt.), £8.
Trinidad, 20 cs., £43.

GALLIC ACID—
Calcutta, 1 cs. (pt.), £9.

GLYCERINE—
Bombay, 5 c., £37.
Metelin, 2 c., £12.

HYDROCHLORIC ACID—
Bangkok, 2 cs., £5. ; Durban, 10 c. £29. ; Sekondi, 1 cs. £2. ; Trinidad, 8 c., £10. ; Wellington, 1 c., £6.

HYDROFLUORIC ACID—
Durban, 2 cs., £27.

HYDROGEN PEROXIDE—
Bombay, 2 cs., £6.
Colombo, 3 cs., £10.
Santander, 17 cs. (pt.), £6.

IODINE—
Alleppo, 1 cs. (pt.), £11. ; Bombay, 1 cs. (pt.), £26. ; Buenos Ayres, 3 cs., £310. ; Calcutta, 3 cks. (pt.), £257. ; Paris (F.), 20 kgs., £1,660. ; Sydney, 2 cs., £156.

IODINE (RESUBLIMED)—
Aarhus, 1 pkg. (pt.), £26.
Malta, 36 pkgs. (pt.), £27.
Sydney, 1 cs., £57.

IRON AMMONIUM CITRATE—
Sydney, 1 cs. (pt.), £15.

IRON GLYCEROPHOSPHATE—
Launceston, 1 cs. (pt.), £6.

LEAD ACETATE—
Fremantle, 4 cks., £49.

LEAD ARSENATE—
Medan, 80 drms., £203.

LEAD NITRATE—
Beira, 2 pkgs., £13.
Rouen, 8 cks., £84.

MAGNESIA—
Christchurch, 5 cs., £12. ; Shanghai, 2 cs., £5. ; Sydney, 20 cs., £48. ; Wellington, 30 cs., £72.

MAGNESIA (CALCINED)—
Buenos Ayres, 1 cs., £8.
La Guaira, 1 cs., £8.

MAGNESIUM CARBONATE—
Buenos Ayres, 2 cs., £7. ; Calcutta, 2 cs., £9. ; Launceston, 1 cs., £8. ; Melbourne, 5 cs., £11. ; Rio de Janeiro, 6 pkgs., £24. ; Sydney, 4 cs., £10.

MAGNESIUM CITRATE—
Havre, 13 cs., £240. ; Havana, 4 cs., £29. ; Limon, 2 cs., £10.

MAGNESIUM HYDRATE—
Santander, 17 cs. (pt.), £7.
Switzerland, 1 cs., £6.

MAGNESIUM SULPHATE—
Barbados, 5 c., £10. ; Brisbane, 1 t. 4 c., £27. ; Calcutta, 3 c., £12. ; Cape Town, 5 c., £6. ; Colombo, 2 c., £5. ; Delagoa Bay, 14 c., £17. ; Durban, 1 t. 9 c., £37. ; East London, 6 c., £7. ; Fremantle, 1 t. 18 c., £42. ; Launceston, 3 c., £6. ; Malta, 4 c., £5. ; Maryborough, 5 c., £6. ; Melbourne, 11 c., £12. ; Pt. Elizabeth, 1 t. 14 c., £43. ; Sydney, 2 t. 11 c., £57. ; Toronto, 10 c., £8.

MERCURIALS (*otherwise undes.*)—
Calcutta, 2 cks., £48.

MERCURY OXIDE—
Amsterdam, 4 cs., £196.
Wellington, 3 cs. (pt.), £114.

MERCURY SUBCHLORIDE—
Melbourne, 1 cs. (pt.), £6.

NICKEL SALTS (*otherwise undes.*)—
Sydney, 9 cs. (pt.), £24.

NITRIC ACID—
Durban, 2 c., £16. ; Dunedin, 2 c., £6. ; Wellington, 2 c., £8.

PHOSPHATE OF LIME—
Cape Town, 5 c., £15.

PHOSPHORIC ACID—
Cape Town, 2 cs., £5. ; Callao, 1 cs., £16. ; Launceston, 2 cs., £6. ; Sydney, 1 cs., £7. ; Trinidad, 3 cks., £19.

PHOSPHORUS—
Launceston, 5 cs., £44.

PLATING SALTS (*otherwise undes.*)
Brussels, 2 cs., £12.
Switzerland, 1 cs., £10.

POTASH (*otherwise undescribed*)—
Melbourne, 4 cks., £52.

POTASSIUM ACETATE—
Bombay, 1 cs., £8.
Calcutta, 1 ck., £5.

POTASSIUM BICARBONATE—
Calcutta, 1 cs., £6.

POTASSIUM BROMIDE—
Bombay, 1 cs., £9. ; Calcutta, 1 cs., £8. ; Melbourne, 1 cs. (pt.) £7.

POTASSIUM CARBONATE—
Lisbon (F.), 1 ck., £15.

POTASSIUM CHLORATE—
Trinidad (F.), 10 cs., £19.

POTASSIUM CHLORIDE—
Townsville (F.), 240 bgs., £151.

POTASSIUM CITRATE—
Bombay, 3 cs., £42. ; Calcutta, 1 cs., £19. ; Launceston, 1 cs.; £12. ; Melbourne, 2 cs., £24. , Sydney, 19 cs., £141.

POTASSIUM CYANIDE—
Canton, 2 cs., £33.
Shanghai, 2 cs. (pt.), £12.

POTASSIUM IODIDE—
Aarhus, 9 pkgs. (pt.) £92.; Bangkok 3 cs., £289. ; Bombay, 8 cs., £729. ; Calcutta, 3 cs., £263. ; Cape Town, 1 cs., £44. ; Launceston, 1 cs., £44. ; Malta, 36 pkgs. (pt.), £60. ; Muscat, 2 cs., £182. ; Pt. Elizabeth, 1 cs. (pt.), £8. ; Singapore, 7 pkgs. (pt.), £90. ; Sydney, 4 cs., £448.

POTASSIUM METABISULPHITE—
Melbourne, 29 cs., £93.

POTASSIUM PERMANGANATE—
Colombo, 1 drm., £6.
Melbourne (F.), 5 drms., £18.
Sydney, 1 kg., £7.

POTASSIUM PRUSSIATE—
Antwerp, 5 cks., £110.
Paris, 10 pkgs., £155.

POTASSIUM SILICATE—
Bilbao, 20 drms., £38.

POTASSIUM SULPHATE—
Suva (F.), 540 bgs., £472.
Townsville (F.), 480 bgs., £406.

PRUSSIAN BLUE—
Adelaide, 1 ck., £17.; Amsterdam, 1 ck., £64.; Antwerp, 4 cks., £200.; Genoa, 12 cks., £516.

ROCHELLE SALTS—
Hong Kong, 1 c., £7.

SALAMMONIAC—
Ahwaz, 2 kgs., £6.; Cape Town, 6 kgs., £17.; Durban, 4 kgs., £13.; Melbourne, 1 ck., £14.

SALICYLATES (*otherwise undes.*)—
Sydney, 1 cs. (pt.), £6.

SALICYLIC ACID—
Jamaica, cs. (pt.), £13.
Singapore, 1 cs., £12.

SALTPETRE—
Adelaide, 1 t., £41.; Copenhagen, 4 c., £23.; Dunedin, 1 t., £45.; Durban, 12 c., £26.; Pernambuco, 1 t. 19 c., £79.; Pt. Elizabeth, 13 c., £30.; Wanganui, 3 c., £6.; Wellington, 5 t., £204.

SHEEP DIP—
Buenos Ayres, 4 t. 10 c., £208.
Manta, 6 c., £26.

SILVER NITRATE—
Hong Kong, 1 cs., £78.
New York, 1 cs. (pt.), £12.

SODA CRYSTALS—
Hong Kong, 10 c., £38.
Montreal, 2 t. 1 c., £47.

SODIUM ARSENITE—
Durban, 19 c., £69.

SODIUM BENZOATE—
Madras, 18 c., £233.
Melbourne, 4 c., £48.

SODIUM BICARBONATE—
Alexandria, 1 c., £11.; Bangkok, 6 c., £5.; Calcutta, 5 c., £14.; Cape Town, 5 c., £8.; Colombo, 5 c., £10.; Delagoa Bay, 4 c., £6.; Durban, 19 c., £28.; East London, 10 c., £14.; Karachi, 2 c., £8.; Monte Video, 12 c., £36.; Pt. Elizabeth, 8 c., £12.; Sydney, 6 c., £30.

SODIUM BIPHOSPHATE—
Sydney, 1 c., £7.

SODIUM BISULPHITE—
Copenhagen, 5 t., £93.; Hobart, 7 c., £5.; Monte Video, 4 t., £76.; Trondhjem, 5 t. 10 c., £100.

SODIUM BROMIDE—
Hamburg, 1 t. 18 c., £58.

SODIUM CARBONATE—
Rio de Janeiro, 2 c., £11.

SODIUM CHLORIDE—
Bombay, 2 c., £9.

SODIUM GLYCEROPHOSPHATE—
Aarhus, 9 pkgs. (pt.), £9.

SODIUM HYDROSULPHITE—
Barbados, 1 c., £9.
Pasages, 1 c., £10.

SODIUM HYPOSULPHITE—
Colombo, 8 c., £7.
Irish Free State, 11 c., £11.

SODIUM IODIDE—
Aarhus, 9 pkgs. (pt.), £30.

SODIUM PHOSPHATE—
Fremantle, 1 t., £85.

SODIUM PRUSSIATE—
Rio de Janeiro, 1 t., £78.

SODIUM SALICYLATE—
Bombay, 3 c., £38.
Hamburg, 1 c., £42.
Singapore, 7 pkgs. (pt.), £6.

SODIUM SALTS (*otherwise undes.*)
Buenos Ayres, 1 cs. (pt.), £35.
Colombo, 1 cs. (pt.), £8.
Perth, 10 c., £12.

SODIUM SILICATE—
East London, 10 c., £8.

SODIUM SILICO FLUORIDE—
Rouen, 1 t., £27.

SODIUM SULPHATE—
Barbados, 15 c., £5.
Sydney, 10 c., £8.
Trinidad, 13 cks., £6.

SODIUM SULPHITE—
Coquimbo, 2 c., £5.
Lyttleton, 1 t., £25.
Valparaiso, 9 c., £23.

SODIUM TARTRATE—
Hong Kong, 2 c., £7.

SODIUM THEOBROMINE SALICYLATE—
Hamburg, 1 c., £42.

SPENT OXIDE—
Hamburg, 243 t. 5 c., £727.

SULPHUR—
Barcelona (F.), 1 t., £2.
Brussels (F.), 10 c., £6.
Trinidad, 2 t. 14 c., £40.

SULPHUR (FLOWERS)—
Channel Islands (transit) (F.), 10 t., £75.

SULPHURIC ACID—
Aden, 6 c., £7.; Beira, 14 c., £15.; Rio de Janeiro, 9 c., £35.; Sekondi, 10 c., £10.; Trinidad, 2 c., £6.; Wellington, 9 c., £25.

SUPERPHOSPHATE—
Kudat, 37 t. 13 c., £164.

TANNIC ACID—
Bombay, 1 cs., £6.; Melbourne, 1 ck., £18.; Melbourne (F.), 1 ck., £9.; Sydney, 1 cs., £17.

TARTARIC ACID—
Amsterdam (F.), 2 t. 7 c., £282.; Bombay (F.), 1 t., £120.; Calcutta, 3 c., £19.; Calcutta (F.), 1 c., £13.; Concepcion, 2 c., £16.; Delagoa Bay (F.), 4 c., £36.; Durban (F.), 4 c., £31.; East London, 2 c., £16.; Fremantle, 5 c., £36.; Limon (F.), 2 c., £15.; Pt. Elizabeth, 1 c., £6.

THEOBROMINE—
Hamburg, 2 cs. (pt.), 3 cs., £282.

TIN OXIDE—
Launceston, 1 cs. (pt.), £7.

URANIUM NITRATE—
Buenos Ayres, 1 cs., £7.

ZINC OXIDE—
Bombay, 2 cs., £7.; Copenhagen, 425 cks., £1,429.; Colombo, 2 cs., £16.; Lisbon, 2 cks., £9.; Launceston, 1 ck., £6.; New York, 40 cks., £67.

ZINC SULPHATE—
Sydney, 2 cks., £17.

Week ending October 13.

BEESWAX—
Rotterdam, 2 c.; Sydney, 1 t.

CERESINE WAX—
Sydney, 2 t.

FERRO VANADIUM—
Paris, £175.

FULLER'S EARTH—
Accra, 8 c.; Durban, 10 t.; Rotterdam, 53 t.; Santos, 5 t.

GLUE, SIZE, AND GELATINE—
Amsterdam, 3 c.; Antwerp, 1 t. 7 c.; Arica, 4 t.; Boston, 5 t.; Boulogne, 2 c.; Bombay, 1 t.; Colombo, 1 t.; Cuba, 10 t.; Delagoa Bay, 10 c.; Durban, 1 t. 18 c.; East London, 5 c.; Hong Kong, 4 t. 6 c.; Karachi, 10 c.; Kobe, 15 t.; Los Angeles, 3 t.; Madras, 5 c.; Melbourne, 1 t.; Montreal, 1 t. 11 c.; Monte Video, 2 c.; Paris, 20 t. 10 c.; Pt. Elizabeth, 3 c.; Puerto Plata, 1 c.; Shanghai, 3 t. 3 c.; Sierra Leone, 2 c.; Singapore, 4 c.; Sydney, 5 t. 11 c. Yokohama, 20 t.; Zanzibar, 2 c.

LEAD ASHES—
Antwerp, 30 t.

MINERAL WAX—
Rotterdam, 1 t. 12 c.
Wellington, 2 t.

PLUMBAGO—
Melbourne, 1 t.
Rio de Janeiro, 6 c.
Singapore, 10 c.
Stockholm, 3 t. 3 c.

QUININE—
Bombay, 2,223 oz.; Calcutta, 11,100 oz.; Melbourne, 320 oz.; Pt. Elizabeth, 100 oz.; Shanghai, 1,673 oz.; Stettin, 2,645 oz.; Sydney, 7,640 oz.

ROSIN—
Amsterdam, 1 t.; Antwerp, 4 t.; Brussels, 10 c.; Kilindini, 5 c.; Lisbon, 6 c.

SALT—
Bergen, 10 c.; Dunedin, 30 t.; Hobart, 1 t. 12 c.; Madras, 4 c.; Montreal, 2 c.; Penang, 3 c.; Pt. Elizabeth, 16 c.; Yokohama, 2 t. 8 c.

SHELLAC—
Colombo, 1 c.

SOAP—
Alexandria, 1 t.; Amsterdam, 1 t. 11 c.; Arica, 3 c.; Bagdad, 13 c.; Barcelona, 4 c.; Beira, 3 c.; Brisbane, 1 c.; Bombay, 4 t. 5 c.; Buenos Ayres, 17 c.; Calcutta, 2 t. 8 c.; Cape Town, 2 c.; Channel Islands, 6 c.; Christiania, 6 c.; Cologne, 15 c.; Colombo, 18 c.; Delagoa Bay, 8 c.; Demerara, 4 c.; Dar-es-Salaam, 3 c.; Dunedin, 2 c.; Durban, 1 t. 9 c.; East London, 5 c.; Gibraltar, 13 c.; Gothenburg, 10 c.; Hong Kong, 1 c.; Jamaica, 1 t. 4 c.; Karachi, 1 t. 9 c.; Kilindini, 3 t. 2 c.; Kobe, 10 c.; Launceston, 1 c.; Lisbon, 2 c.; Leghorn, 6 c.; Lyttleton, 1 c.; Madras, 5 t. 2 c.; Malta, 8 c.; Melbourne, 14 c.; Mombasa, 1 t.; New York, 2 t. 10 c.; Opobo, 8 t. 18 c.; Ostend, 2 c.; Panama, 1 c.; Penang, 9 c.; Piraeus, 1 c.; Pt. Elizabeth, 15 c.; Pt. Harcourt, 4 t. 9 c.; Pt. Said, 9 c.; Pt. Swettenham, 7 c.; Pt. TAR (STOCKHOLM)—
Valparaiso, 2 t. 10 c.

WAX (*otherwise undescribed*)—
Melbourne, 1 t.

WHITE LEAD—
Adelaide, £95.; Apia, £132.; Auckland, £622.; Barbados, £50.; Bombay, £132.; Brisbane, £91.; Calcutta, £39.; Cape Town, £45.; Durban, £40.; Gibraltar, £8.; Hong Kong, £25.; Lyttleton, £232.; Melbourne, £480.; Montreal, £68.; Mossel Bay, £5.; Napier, £71.; Newcastle, £13.; New Plymouth, £48.; New York, £11.; Ostend, £92.; Panama, £25.; Shanghai, £104.; St. Lucia, £32.; Sydney, £134.; Wellington, £593.

MANCHESTER.

Week ending October 12.

AMMONIUM CARBONATE—
Montreal, 20 cks.

BLEACHING POWDER—
Kotka, 592 cks.

CARBON BLACK—
Switzerland, 2 cs.

CHEMICALS (*otherwise undescribed*)
Abadan, 3,237 drms.; Ahwaz, 60 kgs., 10 cks., 900 drms.

CHROME ALUM—
Danzig, 93 cks.
Hamburg, 15 cks.

COAL TAR PRODUCTS—
Carbolic Acid
Denmark, 31 drms.
Naphthalene
New York, 600 bgs.
Rotterdam, 485 bgs.
Unspecified
Switzerland, 130 drms.

DEXTRINE—
Bombay, 25 bgs.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 51 cks.
Unspecified
Australia, 6 cs., 22 drms.; 26 kgs.; Auckland, 98 kgs.; Basle, 5 cks.; Brisbane, 6 kgs.; Italy, 4 cks.; 1 kg.; Melbourne, 1 cs., 20 kgs.; Montreal, 1 kg.; Rouen, 2 cs.; 3 cks., 11 kgs.; Sydney, 95 kgs.; 7 cs.; Switzerland, 22 cks.

FERRO MANGANESE—
Baltimore, 500 t.
Montreal, 25 t.

GLUE—
Alexandria, 100 bgs.
Adelaide, 12 bgs.

SALT—
Gothenburg, 1,273 t.; Malmo, 2,991 sks., 25 brls., 40 t.; Montreal, 5,280 sks.; Quebec, 3,200 sks; St. John (N.B.), 1,400 sks.

SOAP—
Ahwaz, 3 cs.; Bombay, 17 cs.; Mohammerah, 100 cs.; Canada, 10 cks.

SODIUM SULPHATE—
Philadelphia, 102 bgs.

TALLOW—
Bombay, 56 brls.

ULTRAMARINE—
Montreal, 10 cks.

NEWCASTLE-ON-TYNE

Week ending October 13.

ANTIMONY—
Antwerp, 50 kgs.
Montreal, 45 cks.

BARIUM SULPHATE (BLANC FIXE)—
Bergen, 11 cks.

BARYTES—
Antwerp, 300 bgs.

BLEACHING POWDER—
Copenhagen, 9 cks.; Gothenburg 60 cks.; Rotterdam, 142 cks.

CAUSTIC SODA—
Bergen, 118 drms.; Copenhagen, 79 drms.; Gothenburg, 85 drms.; Rotterdam, 173 drms.

CHEMICALS (*otherwise undescribed*)
Montreal, 2,134 pkgs.

COAL TAR PRODUCTS—
Tar
Cette, 1,490 t.

COPPER SULPHOCYANIDE—
Copenhagen, 2 cks.

LITHARGE—
Antwerp, 28 cks.
Gothenburg, 78 cks.
Rotterdam, 12 cks.

MAGNESIA—
Antwerp, 66 cs., 50 bgs.
Montreal, 20 cs.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE FUTURE OF RUBBER TECHNOLOGY.

THE striking progress that has been such a feature in the development of most branches of industrial technology during the past decade is in no case more markedly typified than in that of the rubber industry. From the time of the discovery of the vulcanisation process by Goodyear about 80 years ago, no advance of fundamental importance was made until the introduction of the organic vulcanisation accelerators about the year 1910. It must not be understood, of course, that no progress was made during the intervening period, but such improvements as were made were entirely in the direction of details in machinery, and the introduction of new rubber products. Even the use of the organic accelerators themselves, whilst leading to appreciable economies in the time of manufacture and giving rise to products of superior physical properties, has not necessitated any drastic modification in the usual methods of rubber manufacture. The first suggestion embodying a radical alteration in these methods was that put forward and patented by Peachey in 1919. According to this process, rubber is vulcanised at ordinary temperatures by alternate treatment with sulphur dioxide gas, and hydrogen sulphide gas. Vigorous efforts have been, and are being made to secure the large-scale adoption of this process, and several minor modifications that have since been made; but up to the present, whilst the process has been operated very successfully upon a large experimental scale, we are not aware that any extensive rubber manufacturing firm has definitely adopted it. The most recent—and, in our opinion, most attractive—proposal for cheapening rubber manufacturing costs, however, is that of the direct utilisation of the rubber latex. We have already referred to this method in these columns on several occasions, particularly in connection with the use of latex in paper making; but our attention has again been directed to the question by some remarkable and far-reaching proposals for the general utilisation of the latex have been made quite recently by the Austrian chemist, Dr. Rudolf Ditmar, of Graz. Dr. Ditmar's proposals embrace practically the whole gamut of rubber products and processes, and are based upon the elimination of the water from the latex either by evaporation or absorption, or by the use of water-absorbing materials, such as calcined gypsum. Thus he employs

porous moulds for the production of shaped articles. The latex is poured over the moulds, the excess water eliminated partly by absorption and partly by evaporation. The resulting coating of rubber—which, of course, preserves its original mechanical strength unimpaired—is vulcanised in the cold or, if colloidal sulphur has previously been added to the latex, by a heat process. The introduction of the colloid mill, which enables practically all the usual rubber compounding ingredients to be prepared in a colloidal hydrosol condition capable of forming stable homogeneous mixtures with latex, has extended very considerably the range of usefulness of Dr. Ditmar's methods, and rendered them applicable to the production of even such unlikely products as solid band tyres. One of the uses to which Dr. Ditmar puts rubber latex appears particularly interesting. We refer to its employment as an impregnating agent for waterproofing wood, where the elasticity of the deposited rubber gives it a decided advantage over other impregnating media, inasmuch as no amount of expansion or contraction of the wood can displace the rubber from the pores in which it was originally deposited. In this connection Dr. Ditmar makes the ingenious suggestion that the old Italian master violin makers, such as Stradivari, used the latex-like juice of the *Ficus Elastica* for impregnating their material before the varnishing process. Some credibility is indeed lent to this idea in that the microscopist Koch has actually discovered a deposit of elastic material under the varnish layer of old violin wood. Thus science would appear about to render yet another service to art.

A LEAD FROM THE ENGINEERING INDUSTRY.

The British Engineers' Association has just forwarded to the President of the Board of Trade a Memorandum dealing fully with the attitude of the engineering industry to the Imperial Economic Conference, and stating in no uncertain manner the dissatisfaction and alarm felt by British engineers generally at the present economic policy of the country. The Memorandum, which sets forth its arguments in an eminently logical manner, and which does not harm its case by any attempt at exaggeration, is worthy of serious study by all having the industrial welfare of this country at heart. Old habits of thought die hard. Confirmed political opinion based upon the experience of over a hundred years' stability in economic conditions is difficult to modify even in the face af a far-reaching change in such conditions. Political inertia, the reluctance to depart from principles deeply embedded in tradition, is one of the greatest dangers confronting us at present. Ultimately, of course, some drastic modification must be made in our fiscal policy. A country's politics must, in the long run, be dictated by the economic conditions prevailing. Normally such changes come but gradually, and in the past the time lag between cause and effect has not been productive of much permanent harm. No parallel can be found in history, however, for the cataclysmal upheaval in the world's economic inter-relationships that has occurred within the last ten years, and we fear that unless the process of readjustment of fiscal policy to economic realities be considerably accelerated, the permanent harm done to our industries will be both extensive and irreparable. The engineering industry has made out a very strong case for immediate measures of protection. Before the war, many of our prominent engineers were Free Traders. They have not changed their opinions as the result of abstract reasoning, but have been driven to their present views by the pressure of facts, the growing total of unemployment, the diminution of output below the economic productive capacity, the emigration of skilled labour, and the realisation of the only termination that our present policy, if not speedily amended, can have.

THE VACUUM FLASK AS A COMMERCIAL CONTAINER.

The work that has been carried out by the Oxygen Research Committee of the Department of Scientific and Industrial Research on the design and construction of containers for low boiling-point liquefied gases, is a striking exemplification of the type of investigation to which Government aided research particularly lends itself. No one commercial undertaking, even if it had deemed it advisable to attack the problem on the broad lines adopted by the Committee, could have provided the facilities and the range of technical and scientific service that have enabled the Committee's research to be carried to the advanced position now reached. Despite the progress made by the Gas Cylinders Committee on the design and construction of cylinders for compressed gases, it is obvious that the weight of such cylinders will always prove a grave disadvantage in this method of storage and transport; and as regards aeronautical, medical, and general scientific purposes, there can be no doubt that the use of oxygen and other gases in the liquid condition is the method of the future. Although the double-walled vacuum flask was the invention of the late Sir James Dewar, to whom is due also the discovery of the remarkable effect of activated charcoal and other substances as adsorbents for traces of gases, yet the commercial metal vacuum vessel container was first produced in Germany. During the latter part of the war, when such vessels were required for the Royal Air Force and for the Royal Army Medical Corps, the manufacture was commenced in this country, and a vessel of an efficiency considerably surpassing that of the German product was constructed to the Air Ministry specification. It has been the task of the Oxygen Research Committee to consider how this efficiency may be still further improved, and how the loss of liquefied gas by evaporation may be reduced to a minimum. This task the Committee has successfully accomplished, and although finality has by no means been reached, yet the amount of information and experience gathered from the standpoints both of theory of design, and practical details of manufacture and testing, makes it safe to assume that the advent of the perfected commercial vacuum vessel is very near.

THE CASTOR OIL INDUSTRY.

By "Omega."

CASTOR OIL is obtained from the seed or bean of *Ricinus communis* and *Ricinus sanguineus*. The castor fruit consists essentially of a rough white pod which protects a white kernel covered by a husk, which again encloses a delicate brittle shell. The plant, which grows to a height of 35 to 40 feet, is cultivated widely in tropical and sub-tropical countries, particularly in India, Ceylon, and Java. Botanical authorities are agreed that *Ricinus* is not a native of India, but has spread from Africa, where it grows in a wild state.

The castor plant is now being cultivated on a commercial scale in Mediterranean countries, Indo-China, Russia, South Africa, Congo, Uganda, Rhodesia, Egyptian-Sudan, and the United States of America. Of late years some progress has been made in the cultivation of the plant in Manchuria, the seed being crushed at Newchang in China. The total castor oil produced in Manchuria in 1920 amounted to 2,000 tons, which was exported mainly to Japan, where there is a growing demand for the oil as a special lubricant. However, the primitive Eastern methods of seed crushing cannot compete with the modern European methods. Experiments on the cultivation of the castor plant have been conducted at Marseilles (*Matières Grasses*, 1919, Vol. 12, p. 5,159), but of 23 varieties tested, only 12 developed into maturity, the Indian and Senegal seeds being found to be the most serviceable and to give the hardiest plants.

Much the greater proportion of the castor seed and castor oil produced are obtained from India, where both the small and large seed varieties are cultivated. The superior quality medicinal oil is obtained from the small seed variety, of which India has a monopoly. The total weight of castor seed exported from the world's ports in 1913 was 137,000 tons, of which amount India exported 135,000 tons, a figure amounting to 98 per cent. of the total.

The Growth and Present Extent of the Industry.

Castor oil appeared as a commercial commodity on the European markets early in the 19th century. The growth of the industry has been phenomenal as is seen from the table given below, in which the Indian exports for the years indicated are shown:

Indian Exports of Castor Products.

Year.	Castor Seeds (tons).	Castor Oil (gallons).
1804	—	2,200
1877	—	56,000
1879	11,880	2,651,889
1890	44,731	2,664,990
1913	134,888	1,007,000
1917	92,447	1,723,000

The fluctuating sterling value of the Indian castor seed is shown in the following table:

Exports of Castor Seed from India.

Year	1912/13	1913/14	1914/15	1915/16	1916/17.
Tons	110,630	134,888	82,814	87,948	92,447
	£ 1,092,177	1,336,649	773,289	802,185	957,201

The extent of the Indian castor oil and seed trade is also shown in the following table, which is compiled from the Indian Government Returns:

Year.	Castor Oil (English gallons).	Seed. (American gallons).
1918	2,502,618	219,603,888
1919	1,990,776	183,656,816
1920	353,290	18,950,808

The Principal Directions of Trade.

The principal countries of destination of the castor seed exported from India in 1890 and 1913 are given below. The increase in the English castor-seed trade has been phenomenal compared with the other European countries.

	1890. Tons.	1913. Tons.
England	11,500	60,277
France	25,000	20,988
Belgium	2,150	14,822
Italy	4,040	11,788
Germany	—	9,761

The total English trade (Board of Trade Returns figures) in castor oil and castor seeds for the years 1913, 1919, 1920, are given below:

Imports of Castor Products into Great Britain.

Year.	Castor Oil. Tons.	Castor Oil. Value.	Castor Seeds. Tons.	Castor Seeds. Value.
1913	1,399	£41,875	60,277	£710,587
1919	354	£29,186	14,813	£487,557
1920	420	£39,140	14,647	£440,320

Exports of Castor Oil from Great Britain.

Year.	Castor Oil. Tons.	Castor Oil. Value.
1913	10,818	£301,839
1919	2,789	£282,754
1920	4,130	£414,096

For the years 1912-1916, of the total castor seed imported into England, Hull received 82 per cent., by far the greater portion coming from British India.

Production of the Castor Oil from the Seeds.

The castor seeds themselves are composed of 25 per cent. husk and 75 per cent. kernel, the husk being of no value as an oil-bearing substance. The oil content of the seed varies from 45-55 per cent., and that of the kernel from 60-65 per cent. The following percentage analysis of Bombay castor seed is given by Kling (*Landwirtschaft Versuchs-Stationen*, 1906, Vol. 64, p. 51/52):

	Compn. of Seed.	Water.	Protein.	Oil.	Carbo-Hydrates.	Fibre.	Ash.
Whole Seed .	—	5.14	17.88	46.65	12.61	14.99	2.73
Kernel	70	3.60	23.43	66.02	4.01	0.70	2.24
Husk	30	8.76	4.76	0.98	32.92	48.69	3.89

The percentage of husk appears to vary in different varieties of seed—*e.g.*, three varieties of seed from Cyprus were found to vary from 35 to 48 per cent. (*Bull. Imp. Institute*, Vol. 17, No. 4, p. 492).

Seasonal variations and general native economic conditions, are reflected in a remarkable manner in the market prices of the castor seed, as may be seen from the table given below:

Year.	Price of Castor Seed per ton.
1913	£9–12
1919	£30–40
1923	£18–21

For the best quality medicinal oils, the seeds are first freed from any foreign matter and decorticated. The kernels after separation from the light husks by means of a blast of air in a specially constructed magnetic separator are then crushed between rollers, made into a pulpy mass and cold-pressed by means of an hydraulic press, when the best oil is obtained. Solvent extraction methods are unsuitable for the production of medicinal castor oil.

The oil extracted at low temperatures dissolves the least amount of colouring matter and is of a high quality, being known commercially as cold drawn, salad or virgin quality oil. Only traces of ricine pass into the oil in the cold. During the first pressing about 25/30 per cent. of the oil is expressed. More oil is obtained from the residue by further pressing in the warm, such further oil being used for manufacturing and lubricating purposes. By hot expression the oil content of the cake is reduced to about 8 per cent. Finally the cake is solvent extracted which process further reduces the oil content to about 1 per cent.

Composition and Uses of Castor Cake.

The castor cake retains the alkaloid and is hence unfit for cattle feeding purposes. It is used as a fertiliser. Nagel (*J.S.C.I.*, 1902, p. 31), states that although the alkaloid contained in castor cake is highly poisonous to man, it has but little effect on bird life. Nagel fed chickens without injury on castor cake alone for 8 days. The composition of castor cake varies according to the method of extraction used and the source and treatment of the seeds. The composition of various castor cakes are given below, and are quoted from "Reports on Oil Seeds" Indian Trade Inquiry, 1920, p. 135.

Composition of Castor Cakes.

	From Whole Seed. Per cent	From Decorticated Seed. Per cent	From Castor Meal Extracted by Solvents Per cent
Moisture	9.85	10.38	11.73
Ash	15.02	10.50	6.05
Oil	5.25	8.75	1.10
Proteins	20.44	46.37	30.62
Crude Fibre	49.44	24.00	36.52
Carbohydrates			36.96
Phosphoric Acid ..	1.62	2.26	—

The fertilising value of the castor cake may be judged from the following statement of percentage vital components which is typical of the Indian product:—Nitrogen, 6.37 per cent.; phosphoric acid, 2.55 per cent.; and potash, 0.96 per cent.

Typical percentage analyses of Manchurian castor cake are as follows:—Proteins, 34 to 40; fibre, 30 to 40; soluble carbohydrates, 12 to 18; ash, 6 to 9, and oil 1 to 3.

The principal solvents used in castor seed extraction are carbon bisulphide, solvent naphtha B.P. 108° to 112° C., carbon tetrachloride, trichlorethylene, and benzene. The present prices (October, 1923), of the various grades of castor oil and castor cake are as follows:

	Per ton.
Castor Oil (Pharmaceutical)	£57
,, (First Pressed)	£51
,, (Second Pressed).....	£49
Castor Cake	£5

Properties of Castor Oil.

Castor oil is pale-green to water-white in colour, thick, viscid with little odour. It has a mild though nauseous taste, followed by a sense of bitterness. It is characterised by its high density, viscosity, acetyl value, solubility in alcohol and high optical activity, being strongly dextro rotatory. This latter phenomenon is due to the presence of ricinoleic acid, which contains asymmetrical carbon atoms. Dilution or sophistication of castor oil is no easy matter, as it can be readily detected. Castor oil, for example, possesses a much higher solubility in alcohol than any other oil which could be economically introduced. Castor oil is soluble in glacial acetic acid, insoluble in light petroleum and in ether, and does not readily congeal at low temperatures. The following table shows the characteristic high values of castor oil compared with other oils:

	Specific Gravity.	Acetyl Value.	Viscosity.
Castor Oil	0.9650	148	1160
Coconut Oil	0.9250	12	64
Cotton Seed Oil	0.9235	15	206
Palm Oil	0.9210	18	175

The following are the more important physical constants of castor oil:

Specific gravity at 15.5/15.5° C.	0.9600	to	0.9679
Saponification value.....	183	,,	186
Iodine value (absolute, Wright)	106.9		
,, (Wij's)	84	,,	86
,, (Hübl.)	82	,,	84
Acetyl value	146	,,	150
Hehner ,, ...	0.14	,,	14.5
Reichert—Meissel value	1.2	,,	2.5
Melting point	−5°	,,	−6° C.
Solidifying point	−10°	,,	−18° C.
Refractive index at 15° C.	1.4803		
,, ,, 60° C.	1.4647		
Viscosity at 37° C.	1160 seconds.		
,, (absolute at 40° C.)	248	,,	
Viscosity ratio number	15		
Optical rotation (200 mms. tube)	7.5°	to	10°
Unsaponifiable matter	0.3	,,	0.6 %
Maumené test	46° C.	,,	
Specific temperature reaction (strong acid)...	91°	,,	92° C.
Specific temperature reaction (89/90 per cent. acid)	84°	,,	86° C.
Bromine thermal test	14.5°	,,	15° C.
Elaidin test	Pearly white solid.		

Castor Oil Fatty Acids.

Specific gravity at 15.5/15.5° C.	0.9509
Solidifying point	3.0° C.
Melting point	13° C.
Neutralisation value	192.1° C.
Iodine value (total fatty acids)	87 to 93
,, (liquid fatty acids)	107
Refractive index at 60° C.	1.4546
Mean molecular weight	295

Castor oil is rendered miscible with mineral oils by heating at 300° C. at 80lb. pressure. A soap soluble in mineral oils is also produced by saponifying after heating at 250° C. Castor oil becomes highly fluorescent when heated with logwood, tumeric, or camwood. Castor oil preserves well and does not easily become rancid. Lewkowitsch exposed a quantity of castor oil in thin layers over the course of 4 years, and found but little rancidity and that the increase in free fatty acids amounted to less than 1 per cent.

Catalytic Decomposition and Oxidation of the Oil.

Destructive distillation of castor oil gives oenanthaldehyde and undecylenic acid, the residue consisting of the anhydride of triundecenoic acid (*Thoms. Arch. d. Pharm.*, 1901, Vol. 239, p. 1). Castor oil heated in the presence of a concentrated solution of zinc chloride, polymerises forming a crystalline mass. The catalytic decomposition of castor oil varies with the catalyst used and also depends on the temperature. Mailhe (*Compt. rend.*, 1923, Vol. 176, pp. 37/40), states that above 600° C., using copper and aluminium as catalysts, hydrocarbons of the following type are produced: Benzene, toluene, m-xylene, and oenanthaldehyde, below 600° C., homologues of methane entirely are formed. Brochet (*Compt. rend.*, 1923, Vol. 176, pp. 513/516), found that under a pressure of eleven atmospheres using nickel as a catalyst at 112° C., castor oil is completely hydrogenated in 90 minutes, one gramme of castor oil absorbing 70 c.c. of hydrogen. The hydrogenated castor oil produced had an iodine value of 2 and a melting-point of 86° C. Paul (*Berichte*, 1908, p. 2,283; and 1909, p. 1,543), obtained a product of iodine value 1.9 and melting-point 77° C.

The Villiers (London) Co. (*Brit. Pat.*, 193,099, of 1921), claim that a superior lubricant is produced by introducing a small percentage of a metallic stearate into castor oil at boiling temperature. During blowing or oxidation castor oil undergoes a distinct change as may be seen from the following table (quoted from Lewkowitsh, Vol. 2, p. 396).

	Before Blowing.	After 10 hrs. Blowing.
Colour	Light Yellow.	Orange Yellow.
Specific gravity	0.9623	0.9906
Acid value	1.1	5.7
Saponification value....	179	191
Acetyl value	146	165

The Composition of Castor Oil.

Castor oil is composed mainly of the triglyceride of ricinoleic acid with a small percentage of the glycerides of dihydroxystearic acid and stearic acid, see Haller (*Compt. rend.*, 1907, Vol. 144, p. 462). The oil contains the dextro and lævo rotatory ricinoleic acid, but the latter variety has not yet been isolated. A specimen of the ricinoleic acid prepared from castor oil had a melting-point of 4° C., and a specific rotation in acetone of $[a]_D$ = + 6.25° to 7.50° (Walden).

The pure acid according to Krafft has a M.P. of 16/17° C., whilst Juillard states that with continued crystallisation he obtained a final product of M.P. 4/5° C. According to various authorities the ricinoleic acid content varies from 90-95 per cent. Jones (*J.S.C.I.*, 1917, p. 359), states it to be 93 per cent. and that the transparency of the sodium soap of castor oil is due to the presence of this constituent. The ricinoleic acid content of castor oil may be calculated approximately from a consideration of the respective acetyl values of castor oil and triricinolein, which are 150 and 158.8, giving approximately 94.5 per cent. triricinolein.

Castor seeds have been found to contain a highly toxic element "ricin," see Mendel (*Proceedings, Amer. Physiol. Soc.*, 1903, pp. 36/38), and Harris (*Zeit. f. analyt. Chem.*, 1907, Vol. 46, p. 213). Ricin enters into the composition of the seed proteids and physiologically agglutinates the red corpuscles of the blood. The castor seed also contains fat-splitting enzymes, upase and urease which are capable of hydrolysing urea (Falk, *J.A.C.S.*, 1914, Vol. 36, p. 2,166). Some of these enzymes have found commercial application for fat-splitting purposes. The castor enzyme, upase, hydrolyses some edible oils at low temperatures. (Blanchet, *Compt. rend.*, 1914, Vol. 158, p. 895). Investigations are now being made on the effect of these enzymes on the hydrolysis and rancidity of fats and oils during preservation, and particularly during storage of foodstuffs under cold-storage conditions.

The composition of castor oil and the state in which the oil exists in the seed have been investigated by Policard and Mangenot (*Compt. rend.*, 1923, Vol. 177, pp. 1,840/1,846), by a novel method. A sectional seed was pressed gently on to a prepared dry plate of the dyestuff Biebrick scarlet red in benzene. The dye crystals immediately penetrated the seed cells. Microscopic examination of the seed after treatment showed the appearance of coloured crystals of aleurone, but no nucleus could be observed. The authors conclude that the oil in ripe castor seed does not exist as an emulsion. The oil increases during the period of maturing and dehydration takes place, with the expulsion of water. An inversion takes place, the external phase displacing the internal phase. Mangenot (*Compt. rend.*, 1923, Vol. 177, pp. 346/350) also found that prior to the germination period, the oil is distributed evenly throughout the grain, and that eventually the oil coagulates into drops and become suspended in the cytoplasm.

The Refining of Castor Oil.

The refining of crude castor oil consists mainly in the removal of the albumen, free fatty acids, colouring and odorous matters, and is conducted by first coagulating the albuminous matter and mucilage by steaming and filtering, then bleaching and deodourising by agitation in the presence of animal charcoal, and finally filtering and drying. The bleaching of the solvent-extracted castor oil has been found to be a difficult operation. The colouring matter is held in colloidal suspension, and has probably become very firmly fixed during the heating operation. It is most resistant to the action of bleaching agents (*Boll. Olli. e. Grassi*, 1923, Vol. 1, pp. 53/56).

Recent investigations have shown that the presence of traces of metals such as copper and iron have an important influence on the colour of oils. The percentage iron content of a number of oils have been found to be as follows:—Castor oil (medicinal), 0.0004; castor oil (commercial), 0.0022; olive oil (commercial), 0.0016; and cod-liver oil (medicinal), 0.0004.

Schwareman (*U.S. Pat.*, 1,372,632, of 1921) proposes refining castor oil by agitating at a temperature of 82° C. with an amount of caustic soda equivalent to the free fatty acids contained in the oil. The oil is then washed with hot water, the aqueous layer allowed to subside and the oil drawn away and dried. C. and G. Müller, Speissefett Fbr. A.G. (*Ger. Pat.*, 339,027, of 1918), suggest an ingenious method of fractional precipitation of the castor oil from an aqueous-acetone solution of the crude oil, sufficient water being added to precipitate the oil and still hold the free fatty acids in solution. Lemmens (*Brit. Pat.*, 197,974, of 1921), refines castor oil by atomising the oil into excess of dilute alkali, the refined oil flowing away by means of an overflow pipe placed at a high level and quantities of the spent alkali drawn away at regular intervals. Various methods making towards the preservation of losses during refining of castor oil, such as the addition of salt and the introduction of substances to operate as adsorbent agents, have been suggested by Bechhold (*Chem. Umschau.*, 1923, Vol. 30, p. 199).

Commercial and Industrial Applications.

The principal uses of castor oil are, as a lubricant, a preservative for leather and leather belting, a leather dressing and fat liquoring, in the preparation of artificial leather, linoleum, and rubber substitutes, and as a component of blended lubricants. It is also used in the preparation of gums and adhesives, in soap manufacture, and for medicinal purposes, where its purgative action has been found to be due to the ricinoleic acid. Castor oil also finds extended use in the manufacture of Turkey red oil. The castor oil cake finds a ready market as a fertiliser, and has been found to be specially suitable for the fertilising of tea, sugar-cane, and potatoes. There is also some application of the castor oil cake as a fuel for engines and boilers, and also as a base for the production of illuminating gas by a low-temperature carbonisation process. Morser (*Landw. Vers.*, 1911, Vol. 75, p. 107), states that castor cake under the name of "poonac" is used for caulking timber, and for the destruction of insects. In 1913 India exported 4,900 tons of castor cake to Ceylon, to be used as a fertiliser on the tea plantations. The annual French imports of castor oil cake is about 20,000 tons, for use mainly by the market gardeners.

Castor oil during the period of war, became a substance of first-rate importance as a lubricant for aeroplane engines, and an enormous demand arose, which was also the means of fostering the industry of castor seed crushing in India. Castor oil is an excellent lubricant for internal combustion engines and loco bearings which need a viscous lubricant. During 1917 the total castor oil imported into the U.K. from all sources amounted to 2,000,000 gallons, together with 45,000 tons of castor seed, which would yield about 4,000,000 gallons of oil, which was used mainly for military aircraft purposes (*J.S.C.I.*, 1919, p. 32OR). Prolonged investigations have been made in Belgium towards the utilisation of castor oil as a motive power (*Bull. Mat. Grasses*, 1921, Nos. 7 and 8). M. Mathot found that vegetable oils can be used with advantage as a fuel in 2 and 4 cycle Diesel engines, and that castor oil is particularly suitable, being an excellent fuel and lubricant.

Shrader states that the normal castor oil consumption of the United States is over 2,000,000 gallons per annum (*U.S.A. Agric. Bull.*, No. 867, 1920). The average imports of castor seed for the years 1912/1917 was 17,000 tons, and for 1917/19 26,000 tons, the increase being due to the great demand for castor oil for aeroplane engine lubrication purposes. A conference has been held recently by the Italian Government to consider the question of growing the castor plant in the Southern Provinces. At present Italy imports seeds and oil from British India (*Chemical Trade Journal and Chemical Engineer*, August 17, 1923).

Turkey red oil consists essentially of a mixture of ricinoleic acid and sulpho-ricinoleic acid, and is used primarily for alizarin dyeing. It is prepared by mixing together castor oil and 25 per cent. sulphuric acid, the temperature being maintained below 35° C. When the reaction is complete, salt is added and the precipitated material is separated and washed with salt water and neutralised with caustic soda. A good quality Turkey red oil should contain at least 60 per cent. fatty acids (*Siefens, Zeitung*, Mar. 29, and April 6, 1923). Schopper (*Gummi Zeit.*, 1916, Vol. 30, p. 601), has used castor oil for the purification of raw rubber, the resins being easily soluble and the resin-castor oil solution makes an excellent soap stock. Schelle1z (*Pharm. Zeit.*, Vol. 57, p. 473), proposes castor oil as a substitute for camphor in the manufacture of celluloid and also as a solvent for sulphur in pharmacy. Patat and Co. (*French Pat.*, 361,954), manufacture an adhesive agent consisting of gum tragasol and castor oil. Escalles (*Explosivstoffe, Dammers Chemische Technologie der Neuzeit*), states that castor oil is used in the explosive industry, and enters into the composition of the blasting explosive Cheddite, made at Chede, in Hauté-Savoie. A palatable castor oil is made by introducing into the oil, 0.1 per cent. saccharin, 0.4 per cent. methyl salicylate, 2 per cent. alcohol, 0.1 per cent. oil of cassia, and 0.01 per cent. oil of aniseed (see *Year Book of Pharmacy*, 1917, p. 315). During recent years much success has been attained in India in the production of a high grade castor oil which is claimed to be entirely free from acidity, for use in aero engines (*Journal Indian Industries*, Nov., 1921).

Oil Splitting by Castor Seed Enzyme.

Considerable research has been conducted on the lipolytic enzymes contained in castor seeds, particularly as regards their application in fermentation and fat splitting operations. Siegmund (*Sitz. Kais. Akad. Wiss. Wien.*, 1901, Vol. 100, pp. 328-9), investigated castor seed, *ricinus communis* and *r. major*, the active enzyme being extracted with water and found capable of hydrolysing fats and oils. Green (*Proc. Royal Soc.*, 1890, Vol. 48, p. 370), gives the results of numerous experiments in a botanical and plant physiological study of the castor seed enzyme. Sudborough and Watson (*Journal of Indian Institute of Science*, 1919, Vol. 2, Pt. 15, pp. 213/273), give a detailed account of the modern researches on the castor seed enzymes and their applications in oil splitting. Green summarises the results of his classical researches as follows (quoted from *Journal of Indian Institute of Science*, 1919, Vol. 2, Pt. 15, pp. 214):—

1. The reserve material of the seeds of *r. communis* consists of oil and protein matter, the latter being a mixture of globulin and albumose. 2. The changes during germination are partly due to ferment action, and three distinct ferments are present—viz., a proteolytic or tryptic, a fat splitting or lipolytic and a rennet ferment. 3. At least two of the three, and probably all three, are in a zymogen condition in the resting seed and become active in consequence of the metabolic activity set up in the cells by the conditions leading to germination—*e.g.*, warmth and moisture. 4. The proteins are converted into peptone and finally into asparagin. 5. The oil is split into fatty acids and glycerol; the latter gives rise to sugar and the former to a crystalline vegetable acid soluble in water and ether. 6. The appearance of starch and of oil in the embryo or young plant is due to secondary reactions and not to a simple translocation of either.

The castor husk and the castor oil have no lipolytic activity, and it has also been established that germinating seeds are less active lipolytic agents than the non-germinating or resting seeds. The optimum H-ion concentration for the lipase activity of castor seed is 1×10^{-5}. When the acidity is increased above this point the lipolytic activity declines and becomes stationary at a H ion concentration of 1×10^{-3} (*J.A.C.S.*, 1921, Vol. 43, pp. 2,664-2,670). Of the two lipolytic enzymes contained in castor seed, esterase is soluble in water and hydrolyses true esters, like ethyl acetate, more readily than glycerides like triacetin. Lipase is insoluble in water and is more active in the hydrolysis of glycerides. It is a remarkable fact that castor enzymes become inert in the presence of alkalies, alcohol, formaldehyde, or soap (Ormerod, *Proc. Royal Soc.*, 1906, Vol. 78, p. 376), and that their action is increased by the presence of sodium glycolate, calcium, and magnesium salts and hydroxyl ions. Dakin (*J. Physiol.*, 1903, Vol. 30, p. 84), shows that the lipase enzyme has a

selective hydrolysing action on racemic mandelic acid esters, the unsaponified ester being found to be lævo-rotatory and the free acid dextro-rotatory.

Coconut oil and palm kernel oil are more difficult to hydrolyse by means of the castor enzymes than most of the other vegetable oils. Animal fats such as lard are still more resistant. Acetic acid and manganous sulphate have a marked catalytic and accelerating effect on castor enzyme fermentation reactions. The optimum temperature is 30° C., when the best results are obtained; at 36° C. enzyme activity becomes feeble, and fails entirely at 40° C.

The Adulteration of Castor Oil.

The detection of adulterants in castor oil is not usually a difficult matter. Fabot (*Annalen Chim. Analyt.*, 1917, Vol. 22, pp. 217/225), has studied the whole question, and his results may be summarised thus:—

(1). Above 2 per cent. of foreign oils may generally be detected by the acetyl value, the other values being of no consequence for this purpose.

(2). Arachis oil is detected by the solidifying point, solubility in alcohol, and also the turbidity temperatures of alcoholic solutions. A 1 per cent. solution of castor oil in alcohol is clear at –20° C., 2 per cent. of arachis oil in castor oil gives a turbidity at –2° C., a 1 per cent. solution at –9° C.

A separation of foreign oils from castor oil may often be effected by agitating with excess of petroleum ether, of B.P. 35°/70° C.

The specific gravity of genuine castor oil is higher than that of any fatty oil except oxidised oils. An excessive addition of a foreign oil would be detected by the optical activity. Oxidised oils would be identified by the high acetyl value, low saponification value, and the absence of soluble acids in castor oil. The chlorine index figure also affords a ready means of detecting the presence of adulteration.

The ozone number is also of value in determining the purity of a specimen of castor oil. The ozone values of typical vegetable oils are as follows, quoted from Fenaroli (*Gazz. Chim. Ital.*, 1906, Vol. 36 (2), p. 292):—Linseed oil, 33.5; maise oil, 21.6; and castor oil, 16.3.

Allen states that on examining a large number of imported castor oil samples, the more common adulterants were: poppy oil, rosin oil, coconut oil, lard oil, and seal oil. In some cases blown or oxidised oils had been introduced, amongst this class were identified blown cotton seed, rape, and linseed oils.

The Outlook for the Industry.

Of all the vegetable oils used commercially and industrially, castor oil appears to have found the widest variety of applications, although not the most extensive. During the last decade it has become a commercial commodity of national and outstanding importance as a lubricant, especially for aero engines, in which capacity its superior qualities have been recognised, and found for the oil almost world-wide application. The future of the castor oil industry lies in the economical raising and intensifying of castor crops by modern forestry and agricultural methods, which would tend to reduce and stabilise the price of the castor seed and oil, and so bring the oil into a wider and still more general application in commerce and industries.

The French Dye Combine. — Further information is now available regarding the amalgamation of the Compagnie Nationale des Matières Colorantes and the Etablissements Kuhlmann-Manufactures de Produits Chimiques du Nord, a preliminary announcement of which appeared in our issue of October 12. The capital of the allied firms will be 150,000,000 francs. The new company's board contains six former directors of the Cie. Nationale des Matières Colorantes. The general manager of the Etablissements Kuhlmann, M. Raymond Berr, will hold a similar position in the new company, while the general manager of the Cie des Matières Colorantes, M. Joseph Frossard, will become the head of the organic chemicals department. These two departments will be parallel. The manufacture of intermediate products will be undertaken in future mainly at Oissel, whereas the works at Villers-Saint-Paul will be devoted to colour manufacture. By this amalgamation national competition will be avoided, and the technical knowledge of one concern is allied to the hundred years' commercial experience of the other.

ESTIMATION OF SODIUM HYDROSULPHITE.

SIMPLIFIED IODIMETRIC METHOD.

In a previous issue (*The Chemical Trade Journal and Chemical Engineer*, February 23, 1923, page 224) we published the details of a new method for the estimation of sodium hydrosulphite worked out in the research laboratories of Brotherton and Co., Ltd., at their Port Rainbow Works. This method was based upon the decomposition of sodium hydrosulphite in formaldehyde solution into an equimolecular mixture of sodium-sulphoxylate formaldehyde and sodium-bisulphite formaldehyde, the former of which two compounds reacts quantitatively with iodine in neutral or acid solution, and so enables an iodimetric volumetric method of analysis to be elaborated.

Whilst this method represented a great advance over previous methods in simplicity of manipulation, in speed of execution, and accuracy of results, yet the chemists of Brotherton and Co. recognised that finality had not been reached, and continued their investigations with a view to still further simplification of the analysis. As a result they have now elaborated a method which not only renders the use of formaldehyde unnecessary, but enables the quantitative estimation to be carried out in open apparatus. The great advantage of the new method, however, is that the results are not affected by oxygen in the water used in the analysis.

The method must not be used for analysing hydrosulphite containing decomposition products or soda ash. Messrs. Brotherton and Co. have published the method in leaflet form, and will be pleased to send a copy to any chemist who makes application for one. We give below the new method as described in the leaflet:—

Theory of the Process.

A mixture of hydrogen iodide and hydrogen iodate in solution decomposes at once, giving free iodine:

$$HIO_3 + 5HI = 3I_2 + 3H_2O.$$

A mixture of potassium iodide and iodate can, therefore, be used to measure the hydrolysis of the bisulphite formed when "Hydros" (sodium hydrosulphite) oxidises potassium iodate:

$$3Na_2S_2O_4 + KIO_3 + 3H_2O = KI + 6NaHSO_3$$
$$6NaHSO_3 + KIO_3 + 5KI = 3I_2 + 3H_2O + 3Na_2SO_3 + 3K_2SO_3.$$

The sulphite formed in the reactions above is oxidised by the free iodine:

$$3Na_2SO_3 + 3K_2SO_3 + 6H_2O + 6I_2 = 3Na_2SO_4 + 3K_2SO_4 + 12HI.$$

The hydrogen iodide, however, reacts with more of the iodide-iodate mixture and liberates a further six molecules of free iodine, so that the oxidation of the sulphites may be ignored:

$$12HI + 2KIO_3 = 2KI + 6I_2 + 6H_2O.$$

The effect of Hydros on a mixture of potassium iodate and iodide is, therefore:

$$3Na_2S_2O_4 + 4KIO_3 + 2KI = 3I_2 + 3Na_2SO_4 + 3K_2SO_4.$$

The Hydros liberates its equivalent of iodine, and this iodine is measured by titration with standard thiosulphate.

Analytical Details.

A litre flask is about half filled with water, and 6 grammes of potassium iodate, together with 10 grammes of potassium iodide, are added and dissolved. These quantities are approximate, but more rather than less should be used. 300 c.c. of N/10 thiosulphate is added from a pipette, and the flask filled to within about 50 c.c. of the mark. About 2 grammes of Hydros are accurately weighed in a weighing bottle, and poured into the flask through a perfectly dry funnel with a short wide neck. The flask is first shaken so as to impart a whirling motion to the liquid, then the flask and funnel are inclined to meet the weighing bottle, so that when the latter is completely inverted, the funnel seals its mouth. This prevents the loss of any fine particles of Hydros in the form of a cloud. The flask is then filled up to the mark, stoppered, and shaken till the Hydros is dissolved. The empty weighing bottle is reweighed, and the weight of the Hydros is determined by difference. The excess of thiosulphate is measured by titration (100 c.c. at a time), with standard N/10 iodine.

It is essential that in the weighing the Hydros be transferred from the sample bottle to the weighing bottle with a spatula, and not poured from one to the other. In the latter case a partial separation of the salt, generally used as a diluent, occurs, and the results are always too low, often by several units per cent.

Calculation.

The following example illustrates the method of calculating the result:—

Weight of Hydros taken = 2.036 grammes.
Mean titration = 7.24 c.c.
N/10 iodine used to titrate complete litre
$= 10 \times 7.24 = 72.4$ c.c.
$\therefore$ N/10 thiosulphate left after dissolving Hydros = 72.4 c.c.
$\therefore$ N/10 thiosulphate absorbed in Hydros reaction
$= (300 - 72.4) = 227.6$ c.c.
Molecular weight of Hydros = 174.
$\therefore$ Percentage of Hydros

$$= \frac{174}{2} \times \frac{227.6 \times 100}{10{,}000 \times 2.0136} = 98.34 \text{ per cent.}$$

THE CHEMICAL INDUSTRY OF AUSTRIA.

MATERIAL AVAILABLE FOR EXPORT.

IN *Die Chemische Industrie* (the official organ of the Verein zur Wahrung der Interessen der Chemischen Industrie Deutschlands) of October 20, 1923, there appears the following account of an article by Josef Brunner in the "Wochenschrift des Niederösterreichischen Gewerbevereins."

The chemical industry of Austria has undergone considerable modifications since the Armistice. The large factories which were within the confines of the former Austro-Hungarian monarchy are to-day within the borders of Czecho-Slovakia. The appreciation in the value of Czecho-Slovakian currency and the formidable tariff wall erected by the new State have practically prohibited importation of chemicals into the impoverished and greatly-shrunk Austria, with the consequence that the latter country has had to rely upon Germany to an extent greater than in pre-war days. The tendency of late, however, has been for Austria to commence herself what chemical manufactures she was able, and among the new manufactures that have thus come into being may be mentioned chrome alum, sodium bisulphite, sodium sulphite, sodium thiosulphate, etc. In many of these materials, Austrian production is now considerably in excess of home requirements and export markets are being sought for.

Considerable developments are being made in the exploitation of water power for the purpose of electro-chemical industries. Processes for the fixation of atmospheric nitrogen are being conducted on a manufacturing scale, but the products are being mainly exported. Hydrogen peroxide is being produced electrolytically, but practically the whole of the Austrian output of this substance is being exported to Japan and, to a lesser extent, to South America.

The bleaching powder and caustic soda plants have very little excess production for export, but the general opinion seems to be that the near future will witness a considerable increase in output. Austria is at present exporting large quantities of calcium carbide and lead compounds. The soda ash industry is beset with many difficulties, the principal of which is the high price of salt as fixed by the State which holds the monopoly of this raw material. Ammonium sulphate is at present available for export from Austria in large quantities.

Tartaric acid is a product in the manufacture of which Austria is exceptionally strong. All the three factories which she possessed before the war are still in the territories of the new Austria, and practically the whole of the production is available for export. Again, both in copper sulphate and in glue, Austria is able to satisfy any reasonable demands from outside customers. Austria has always occupied a prominent position in the lacquer and paints industry, and she is still able to export considerable amounts.

Mr. Brunner makes the plea that for the chemical industry of Austria to become really firmly established and to meet competition when the international exchanges become stabilised, all the necessary raw materials such as the mineral acids and the alkalies must be imported duty-free so far as possible. The chemical merchanting-business in Vienna has greatly expanded, the writer stating that the number of wholesale dealers in chemicals and drugs in German-Austria is more than ten times what it was before the war.

TITANIA AS A GLASS CONSTITUENT.

PRODUCTION OF HEAT- AND CHEMICAL-RESISTING WARE.

THE first meeting of the Society of Glass Technology for the session 1923-24 was held in Sheffield on October 17, the President, Professor W. E. S. Turner, D.Sc., in the chair. The initial formal business included the presentation of "Frank Wood" medals to Mr. A. R. Sheen and Mr. F. Winks, by Sir W. H. Hadow, Vice-Chancellor of the University of Sheffield. The President referred appreciatively to the hospitality experienced by members who visited France during the first week of July. It was resolved to send a cordial invitation for a conference in this country sometime during 1924, jointly to members of the Society in France and to the Chambre Syndicale des Maitres de Verreries (the representative body of French manufacturers who had welcomed the party to Paris in July).

Disadvantages of High-Silicon-Boron Glass.

A paper entitled "The Effect of Titania on the Properties of Glass," by A. R. Sheen and Professor W. E. S Turner, was given by Mr. Sheen. Mr. Sheen remarked that a great deal of interest had been shown recently in the production of heat-resisting glass. Manufacturers, especially of scientific glassware, were realising the necessity of making a glass which had a high thermal endurance and which at the same time was capable of resisting the attack of substances with which the glass came into contact, whether solid, liquid or gaseous. Modern heat-resisting glasses contained a high percentage of silica and also boric oxide in considerable amount—*e.g.*, the well-known glass, Pyrex (which owed its high thermal endurance to its exceptionally low co-efficient of expansion, 0.0000032), contained approximately 80 per cent. silica and 12 per cent. boric oxide. There were, however, objections to the use of these oxides. In the case of silica the difficulty was merely one of obtaining a sufficiently high melting temperature. On the other hand, glasses containing boric oxide were very readily melted, but here the objection was the effect of the oxide on the durability of the glass.

Recent Research at Sheffield University.

Recent research in the Department of Glass Technology of Sheffield University had shown that as the B_2O_3 content of a glass was increased the durability towards water and acid increased to a maximum and then as the B_2O_3 content was further increased, the durability fell off rapidly. Boric oxide-containing glasses (and, of course, glasses with high silica content) on account of their acidic nature were very readily attacked by alkali—*e.g.*, it was quite useless using Pyrex ware as an alkali container. What information there was concerning the use of titania in the production of glass seemed to point to the fact that titania glasses were heat-resisting, but no experimental data were given. It was with this consideration specially in mind that this piece of work was undertaken.

Selection of Batch Mixture.

At the outset preliminary tests were made to find out what mixture of silica, titania and soda would give glasses at the highest temperature obtained in glass-melting practice—*e.g.*, temperatures of 1,400° to 1,450° C. It was found impossible to obtain a glass from silica and titania alone at this temperature. Batches were then calculated out on the basis of the glass formula:

$$6SiO_2\ xNa_2O\ yTiO \text{ where } x + y = 2$$

and it was found that the first six members of the series gave glasses quite readily—*i.e.*, glasses of the approximate molecular compositions:—

(1) 6 SiO_2, 1.9Na_2O; 0.1TiO_2
(2) 6 SiO_2, 1.8 Na_2O, 0.2 TiO_2
etc. etc. etc.
(6) 6 SiO_2, 1.4 Na_2O, 0.6 TiO_2

in which the soda was gradually replaced by titania. Above 1.8 mol. TiO_2—*i.e.*, 13 per cent. TiO_2, it was found increasingly difficult to melt the glass and higher temperatures were required. It was found that if these glasses were melted under reducing conditions, their colour varied from light amber to dark brown. Therefore part of the soda content was added as soda nitre and the melting operation was carried out in crucibles with well-fitting lids. By this means colourless glasses were obtained.

There were indications during these melting operations that titania glasses were heat resisting. It was found in

many cases that the glass could be removed straight from the furnace, and allowed to cool down in the open air without splintering or cracking of the mass of glass occurring.

After considering the analyses of these glasses the first question dealt with was the durability of the titania glasses towards water. It was found on comparing with the corresponding lime and magnesia glasses that the titania glasses were less attacked than the lime glasses, especially in the earlier members of the series. The durabilities of the titania glasses were found to be practically the same as those of the corresponding magnesia glasses. The annealing temperatures were found to be rather less than those of the corresponding lime and magnesia glasses.

Heat Resistance Not Due to Low Thermal Expansion.

Next, the important question of thermal expansion was dealt with. It was originally intended to determine this optically by the Fizeau-Pulfrich method, but it was eventually decided to repeat the melts on a large scale (28lb. pot), to draw tubing and determine the expansion by the ordinary dilatometer method. The thermal expansions of these titania glasses (only the first four glasses of the series were tested) were only slightly less than those of the corresponding lime glasses. Therefore if titania glasses are heat resisting it is certainly not due to their having a low expansion as is the case with Pyrex glass, for example, but the cause must be sought in some other factor such as tensile strength or elasticity.

These glasses possessed good working properties, their viscosity increasing as titania replaced soda. Throughout all the glasses melted in connection with this work there was hardly any evidence of devitrification occurring. This bore out the statement of previous workers that titania hindered devitrification.

SOCIETY OF CHEMICAL INDUSTRY.

NOTTINGHAM SECTION.

THE opening meeting of the session of the Nottingham Section of the Society of Chemical Industry was held on October 17, when the Chairman (Mr. J. W. Wilkie, B.Sc., F.I.C.) read his address entitled "Some Reflections on the Importance of Chemistry to the Community, and the Means which should be Adopted to Bring the Fact Home to the Man in the Street."

The Importance of Chemistry to the Community.

The speaker opened his subject by referring to the publicity given to the importance of chemistry during the war, but pointed out that very little reference to this subject had been made by the Press subsequently. He then mentioned some vital questions which were being actively investigated by chemists, such as the close connection between dietetics and deficiency diseases, and the importance of extending our knowledge of the various vitamines. The problem of the exhaustion of the soil was still unsolved in so far as the replenishing of very necessary supplies of potash and phosphates was concerned. Public notice should be frequently brought to such investigations.

In the discussion which followed, as to the ways in which the real meaning of chemistry could be made known more widely, it was generally agreed that the first step was the popularising of the subject in the schools.

The Action of Sodium Hyposulphite on Silver Chloride.

Dr. J. B. Firth and Mr. G. F. Higson then read a paper on the action of aqueous sodium hyposulphite upon silver chloride. In the case of solid silver chloride the action was very slight, but this action increased with temperature (up to a maximum at 50° C.) and concentration of the hyposulphite, the main products being silver sulphide and metallic silver.

The reaction between hyposulphite and silver chloride dissolved in sodium-thiosulphate solution produced silver sulphide in quantitative amounts according to concentrations. This reaction could be utilised for the recovery of silver from silver residues, as the silver sulphide was readily converted into a bead of metallic silver on lightly fusing.

Silver chloride dissolved in excess of ammonium hydroxide solution was rapidly and quantitatively reduced by hyposulphite to metallic silver in a finely divided condition, and thus another method presented itself for the recovery of silver residues. The silver obtained by this reduction was very easily fused into a metallic bead. A similar quantitative reduction to metallic silver (finely divided) occurred when silver nitrate solution, dissolved in excess of ammonium hydroxide, was treated with aqueous sodium hyposulphite.

CHEMICAL TRADE AND INDUSTRY OF GREECE.

PROGRESS DURING 1922.

A REPORT* just issued by the Department of Overseas Trade and compiled by Mr. R. F. H. Duke, C.B.E. (Commercial Secretary, British Legation, Athens), with the assistance of H.M. Consular Officers at Athens, Patras, Crete, Volo, Corfu, Salonica, and Syra, deals fully with the industrial and economic situation in Greece and contains information revised to the end of June of this year.

Factors Influencing British Trade.

Commenting upon the general position, Mr. Duke states: There are two main questions affecting British commercial relations with Greece—namely, the opportunities of obtaining contracts for constructional work or concessions for the development of the natural resources of Greece, and the position of British firms already established and operating in the country. As regards the former, Greece continues to be a country of almost infinite opportunity, of which, however, present conditions render it impracticable to take full advantage. For many years British firms have been looking forward to the possibility of obtaining such concessions as the Piraeus harbour works, the Athens water supply, telephone installation, the drainage of the Struma and Vardar valleys, the reconstruction of the railways, the development of electric power from the Aliakmon and Achelous rivers, and the like. There is obviously little inducement to British firms to commit themselves to definite engagements in present economic conditions, but at the same time the work will have to be carried out in due course, and British firms will be well advised, while not necessarily entering into too definite engagements at present, to keep a close watch on the progress of events.

The position of British firms, industrial, commercial and insurance, who have been for many years operating in Greece, is becoming a precarious one; well-established concerns which have persevered in spite of disappointing results in their endeavours to make a livelihood out of their Greek concessions, are beginning seriously to wonder whether the game is worth the candle. Already before the revolution, economic legislation in 1922 had consisted almost entirely of revenue-producing measures, and the fiscal policy of the Government, though their efforts to make Greece self-supporting by taxation in the absence of foreign financial assistance cannot but be eulogised, has been such as must sooner or later tend to drive foreign capital out of the country.

Chemical Imports into Greece.

Dealing with foreign imports into Greece during 1922, Mr. Duke goes on to say that the principal articles of importation are agricultural products (principally flour and wheat) which account for over 1,250 million drachmae or two-fifths of the total imports, and textile yarns and fabrics, which are responsible for over 579 millions, or more than one-fifth. Minerals and raw metals (218 millions), chemical products (167 millions), sugar (195 millions) and manufactured metals (97 millions) are the other main items of importation. Of chemical products the most important are sulphate of copper (6,778 tons, of which 5,911 tons were supplied from Great Britain), benzine (for motor fuel, 3,560 tons, U.S.A. sending 1,692 tons, and Roumania 1,234); quinine—a monopoly article of which about three-fifths comes from Germany and one-fifth from Great Britain; and dyestuffs—Germany supplies over one-third of the latter, Belgium, one-fifth, France one-eighth, and Great Britain about one-sixth. The position has changed considerably in this field, as in 1921 Great Britain supplied over one-third and Germany only one-seventh, while Belgian trade has also increased. In soda, two-thirds of the trade is divided equally between Great Britain and Belgium, the latter having considerably improved her position since 1921.

Principal Exports from Greece.

Exports from Greece in 1922 have increased to every country except Jugoslavia, Spain, Norway and Russia, and have more than doubled (in value) to many other destinations. Actual increase in tonnage is apparent only (from the detailed statistics for the first ten months) in cheese, hides, tobacco (30,896 tons against 20,175), olive oil (14,641 tons against 9,135), olives, colophony, turpentine, magnesite (23,524 tons against 18,349), soap (8,352 tons against 7,681),

* London. H.M. Stationery Office. Price 1s. 6d. net.

and wine (43,975 tons against 10,613), the principal customer being France, with 28,000 tons. Great Britain is a prominent purchaser in emery (one-half the export) and lead ore.

Olive Oil Production Figures.

H.M. Consul at Corfu, the principal district for olive oil production, reports that the amount realised in 1922 was not up to the estimate, being only 210,000 barrels instead of 250,000 to 300,000. 90,000 barrels were shipped to the Italian and French markets and a small amount to England and America; also about 80,000 to other ports in Greece. The price for export commenced at 250 to 300 drachmae according to quality until the month of August, when the prices fluctuated 450 and 600 drachmae per barrel. The quantity remaining unsold and awaiting demand amounts to 20,000 barrels.

The Vice-Consul at Zante reports a considerably larger crop than in 1921, the figures being 40,000 barrels (or 640,000 gallons) for 1922 compared with 400,000 gallons for 1921. This is all consumed locally, the non-edible oil being used in the manufacture of soap, and export is practically nil. The crop in Crete appears to have been a medium one and amounted to some 20,000 tons as against 8,500 for 1921 (the latter being an exceptionally poor year). The quality is considered very good. The total production of olive oil in Greece for 1922 is given as 98,013,500 kilos.

Greece is now self-supporting as regards supplies of salt, the sale of which is a State monopoly.

Control of the Emery Industry.

The mineral resources of Greece are numerous and varied, but, chiefly owing to lack of suitable transport facilities and the fact that deposits are generally widely distributed in relatively small quantities, they have never been fully exploited.

The output of Naxos emery in 1922 was very small—only about 6,330 tons as compared with 12,709 tons in 1921—owing to a five months' strike in the mines and the continued inadequacy of means of transport and loading. Government prices ruled from £5. to £8. 10s. per ton, but owing to the maintenance of the system of allocation to speculators of all kinds, emery was unobtainable by foreign buyers at prices below £7. to £12. An attempt was made by the French buyers early in the year to interest both the Greek Government and their British and Italian competitors to accept a scheme for transferring the production and distribution of emery to an international company, but British buyers failed to accord their support to the scheme, and it was not approved by the Greek Government. In October, however, Monsieur Hadjikyriakos, the new Minister of National Economy, decided to abolish the prevailing system of distribution and introduced a decree providing (*a*) for improvement of the means of transport with the aid of a loan from the National Bank repayable by an addition to the price of the emery, (*b*) for distribution to bona-fide manufacturers of four-fifths of the production, the remainder being put up to public auction.

The total quantity sold during the year was 12,035 tons, of which 6,257 tons went to Great Britain, 3,358 to France, 850 to Germany and 824 to the U.S.A. Of the 3,500 tons which remained available for allocation when the new system came into force at the end of the year, 1,000 tons each were allocated to French, British and American interests respectively, and a single representative was appointed for each country to deal with the allocation and shipment to the individual manufacturers. The new method introduced both in production and distribution should effect a distinct improvement in the securing of adequate supplies by British users, but the re-opening of the Asia Minor market and the growing use of artificial abrasives from America is likely to diminish the demand for the Greek product in future years.

Magnesite in 1922.

Magnesite mining during 1922 was handicapped by lack of labour and especially of skilled miners, while the absence of demand for all classes of magnesite restricted output still further. The bulk of the magnesite shipped went, as in the preceding year, to Holland and Germany, the export to Great Britain direct from Greece being limited and the United States taking at the most one or two shipments of crude and calcined mineral. The Anglo-Greek Magnesite Company, Limited, produced, during the year, 28,356 tons of crude ore as against 33,100 tons during 1921. Of the raw ore thus mined 12,987 tons were calcined and 8,541 tons were shipped in the crude state. This company's production of caustic calcined magnesite amounted to 5,686 tons, and 6,647 tons of this mineral were sold and shipped. No dead burnt magnesite was produced during the year.

Official figures for the whole year of other magnesite companies are not available (semi-official figures give the total magnesite output for Greece as 55,780 tons). The production of all these other companies during the period January-August, 1922, is given as being 17,000 tons crude ore, about three-quarters of which, it is estimated, were calcined and shipped to Holland, where the caustic calcined magnesite is ground. The purchase by the Anglo-Greek Magnesite Company, Limited, from the Allatini Group of Salonica of the Yerakini Magnesite Mines in the Chalkideau Peninsula for £70,000. is now confirmed. The Yerakini Mines produce a very high grade class of mineral, and are said to have ore reserves of over half a million tons. These mines are probably the richest deposit of amorphous magnesite in the world, and being close to the sea have no transport problem to contend with. It is expected that when these mines are fully equipped and developed they will far outdistance the Euboean Magnesite Mines in cheaply produced good quality ore.

Chrome and Lead Ores.

Chrome ore, which exists in small deposits almost throughout the country, is mainly produced in Thessaly and Boeotia at the mines of Tsangli, Alchani and Boeboda, the production for the first eight months amounting to over 5,000 tons, which would give a figure of some 7,500 tons for the year. The first-named mine shipped 5,800 tons to the U.S.A. during 1922 at 9 dollars per ton f.o.b. Volo.

Lead from the Société Fr. de Mines du Laurium amounted to 3,002 tons, or a rate of 4,500 tons per annum. Lead-bearing ores by the Greek Soc. Metallurgique de Laurium amounted to only 274 tons, or 400 per annum. During the first ten months some 3,400 tons were exported, 2,713 going to Great Britain.

Developments in Greek Industry.

There are signs that industry is developing in Greece, and some of the prominent Greek business men who have hitherto been engaged purely in mercantile operations, are investing capital in industrial companies and creating groups for the establishment of new and modernisation of old factories. Of the more established chemical industries the following figures, based on the estimates of a Government expert as published in the Press, will give an idea of the progress which is being made:—

	1922.	1921.
Chemical Products (total value in drs.)	2,929,920,000	1,612,320,000
Including Olive oil (used for soap-making (tons)	4,000	7,500
Soap (tons)	25,000	20,000
Fertilisers (tons), ...	19,000	18,000
Dyes (tons)	107	105
Colophony (tons)	4,000	3,500
Turpentine (tons)	1,000	900

The chemical industries are going ahead, directed as they are by some of the best commercial and industrial brains in Greece, especially in regard to dyestuffs and other coal-tar products (such as the Greek aspirin "Saloxine" which has an increasing sale) and glass, which in this country has been a development of chemical manufacture. The principal obstacles to the development of Greek industry have so far been the high cost of plant and raw materials owing to the depreciation of the drachma, and the inadequate facilities and high rates of railway transport. Motive power in particular has been expensive owing to the rise in the price of coal from 250 to 950 drachmae per ton during 1922, and the failure of lignite supplies to come up to expectations. Oil-power has developed, some 8,500 tons of crude petroleum having been used for this purpose in 1922 compared with 6,300 in 1921.

Hydrocyanic Acid for Fumigation.—The Ministry of Health has issued (H.M. Stationery Office, 2s. 6d. net) for official use a preliminary report by Dr. P. G. Stock and Dr. G. W. Monier-Williams on the use of hydrogen cyanide for fumigation purposes. The report recommends that in the interests of both health and commerce further inquiry in several directions should be initiated, but the attention of all Government departments and all shipping companies is directed to the data and conclusions embodied in the present report.

THE GERMAN CHEMICAL TRADE.

RECENT IMPORT AND EXPORT STATISTICS.

THE following table which is compiled from statistics given in the *Chemiker-Zeitung* (October 18, 1923) shows the quantities (in doppel-zentner—*i.e.*, in 100 kilogrammes) of the principal German imports and exports of chemical products during the month of July last and during the seven months January-July, 1923. A few metal products, rubber and leather are also included.

	Imports.		Exports.	
	July.	Jan-July.	July.	Jan.-July
Refined waxes, solid fatty acids, paraffin wax, soaps, and other products from oils, fats, and waxes	11,888 ..	53,512 ..	20,546 ..	134,743
Chemical and pharmaceutical products, dyes, and dyewares (total)	243,626 ..	2,050,766 ..	2,353,531 ..	14,751,805

THE DIRECTORATE OF THE DYESTUFFS CORPORATION.

SIR WILLIAM POPE'S REPLY TO MR. J. M. ROBERTSON.

IN our issues of October 12, p. 430, and October 19, p. 459, we have published the correspondence that has taken place, mainly in the columns of the *Morning Post*, on the constitution of the directorate of the British Dyestuffs Corporation. The last letter was the reply of Mr. J. M. Robertson to the criticisms of Sir William Pope. During the past week Sir William Pope has further written to the editor of the *Morning Post* as follows:

Sir,—As Mr. J. M. Robertson in your issue of the 16th deals with the ill-success of the British Dyestuffs Corporation, a few dates and references will further illumine the situation. On March 6, 1915, the prospectus of British Dyes, Ltd., appeared, inviting subscriptions to a national dyestuff scheme, of which roughly one-half the capital was to be subscribed by the Government. This scheme, promoted by the Board of Trade, was widely condemned in the Press and was very adversely criticised in the House of Commons debate on March 11, 1915, when the Government was told that "disappointed shareholders and complaining employees would arraign them for it later." Suspicions were aroused by the absence of technical and scientific leaders from the directorate, but the objections were lightly brushed aside by the Board of Trade. It is certain that the capital could not have been raised in 1915 without the encouragement given by the Board, acting on behalf of the Government; the company was floated without the collaboration of our technical chemical leaders, and, very naturally, this collaboration was not forthcoming when the enterprise became the British Dyestuffs Corporation in 1919.

The depreciation of capital values, the non-payment of dividends, and what is of greater moment, the failure to establish a vigorous coal-tar colour industry in this country are the direct consequence of the policy of the Board of Trade in March, 1915; the shareholders who "ignorantly meddling with politics," to use Mr. Robertson's phrase, put their money into the Government dyestuff scheme could not withdraw it intact when the control of the Board shortly afterwards changed. My own infirmities, upon which Mr. Robertson moralises, are irrelevant to the question under discussion, and I regret that they should have been so unnecessarily, though so eloquently, exposed.—Yours, etc.,

W. J. Pope.

University of Cambridge, October 22.

SOCIETIES' WINTER ACTIVITIES.

PROGRAMME OF COMING SESSION.

WITH the opening of the season when the various societies and institutions renew their activities, it is of interest briefly to review the programmes of the sections. Information as to the work to be undertaken so far as is at the moment available, is given below.

On Wednesday, October 31, a joint Societies' dinner is being arranged under the auspices of the Chemical Society, the Institute of Chemistry, and the Society of Chemical Industry. The dinner will be held in the Edward VII. Rooms, Hotel Victoria, Northumberland Avenue, W.C. 2, at 7.30 p.m. Sir William J. Pope, F.R.S., will be in the chair. Members of any of the societies concerned are invited to attend, and bring guests.

Society of Chemical Industry.

Bristol Section.—The meetings of the Bristol Section, which was established in April, 1917, are held in the Chemical Department of the University, Woodland Road. The opening paper delivered before the members, was "An Outline of Rubber Manufacture," on October 4, by J. F. Reid. Future papers include "Some Aspects of the Paint Trade: Fine-colour and Lake Making," by A. H. Bridges, on November 1; "Reminiscences of an Alkali Inspector," by R. D. Littlefield, on December 6, a joint meeting with the Institute of Chemistry; "The Chemical Technology of Canned Foods," by O. Jones, on January 3; "Current Chemical Research at Bristol University," by Professors F. Francis and J. W. McBain, on February 7, in co-operation with the Chemical Society; the annual meeting and election of officers on March 6, when papers will be read on fuel economy by H. T. Ringrose and H. Womersley. Certain visits to works have been arranged, and the annual dinner will be held in February. The Secretary of the Section is Arthur Marsden, 39, Belvoir Road, St. Andrew's Park, Bristol.

Glasgow Section.—The opening meeting of the Glasgow Section is to be held to-day, October 26, at 7.15 p.m., at 39, Elmbank Crescent. A paper on "The Industrial Chemist" will be read by the Chairman, W. E. Moodie. Further papers include "Artificial Resins—their Preparation and Uses," by Dr. H. Hepworth, on November 23; Ramsay Chemical Dinner at the Ca'dōro Restaurant, on December 20; joint meeting with the Institute of Chemistry on January 25, when a paper will be given by F. W. Harris; "Notes on Continuous Causticising and Cresylic Acid," by W. Walmsley and R. F. Stewart, on February 22; "The Influence on Chemistry of the Recent Knowledge Gained of Atomic Structure," by Dr. John A. Cranston (secretary of the section); April 3, annual general meeting. It is expected that a visit to Provan Chemical Works will be arranged during the Session.

Manchester Section.—Dr. H. Levinstein, the chairman of this Section, opened the current session on October 5, with a paper outlining recent progress in chemistry, reference to which was made in our issue of a fortnight ago. Meetings are usually held at the Textile Institute, 16, St. Mary's Parsonage. On November 2, a joint meeting with other Manchester societies has been arranged, when Professor W. D. Treadwell, of Zurich, is to lecture on "Electrometric Methods in Analytical Chemistry." The annual dinner will take place at the Queen's Hall on November 23. On December 7, a joint meeting with the Institution of Rubber Industry will be held at which papers on vulcanisation accelerators will be given by G. Martin and Dr. T. Callan; "Fuller's Earth," by A. Brittain, and "Fractional Distillation," by C. Elliott, on January 11, 1924; "Reminiscences of Dr. Caro," by Dr. E. F. Ehrhardt, on February 1; "Some Chemical Qualities of the Living Cell," by Professor F. Gowland Hopkins, on March 7. The annual meeting is to be held on April 4, when a paper on "The Tautomerism of Amidines" will be read by Professor F. L. Pyman; and at the closing meeting on May 2, L. Guy Radcliffe and John Atkinson will give a paper on "Some Organic Sulphur Com-

pounds." The section secretary is L. Guy Radcliffe, College of Technology, Manchester.

South Wales Section.—This is the youngest section of the Society, having come into separate existence from the Bristol and South Wales Section only two years ago. Meetings are held both in Cardiff and Swansea; in the former case at the Technical College, Cathays Park, and at Swansea, at the Technical College, Mount Pleasant. The Cardiff meetings opened with a discussion on the "Smoke Problem," on October 12. The President, Dr. E. F. Armstrong, is to visit the Section on November 8, when he will give an address on "The New Chemistry." On December 7, a paper is to be given by T. G. Watts on "Coke Ovens." Interest in this paper will be strengthened by a visit later to the Maritime Coke Works at Pontypridd. A paper on "Cocoa," by Dr. H. W. Bywaters, will be given on January 11; Discussion on the "Action of Acids on Metals," on February 8; and a paper on "Metal Colouring," by E. A. Rudge, on March 7. The session at Swansea opened on October 19 with a discussion on "Short-cuts in Analysis." On November 16, a paper is to be given by E. A. Tyler; January 18, papers on "Routine Work in an Oil Refinery Laboratory," by T. D. Ambrose, and "Estimation of Sulphur in Petroleum," by Dr. H. B. Thompson; February 15, a paper by L. Taverner and H. J. Williams; March 14, joint discussion with the Faraday Society on "Slags and Fluxes in Melting and Refining"; March 28, annual meeting, and address by the chairman. The secretary of the South Wales Section is Dr. H. E. Cox, 139, Stow Hill, Newport, Mon.

Institute of Chemistry.

The annual dinner of the Institute will be held at the Hotel Victoria, Northumberland Avenue, on Monday, December 10, at 7.30.

Birmingham Section.—The membership of the Birmingham Section of the Institute has now passed the hundred mark. A provisional programme for the session has been drawn up, and it is hoped to receive a visit from the President of the Institute early in the New Year. In November, the general meeting will be held, and an address given by the Section President, Professor G. T. Morgan. A joint dinner has been arranged with the Society of Chemical Industry for December. In February or March, the anticipated address by A. Chaston Chapman will be given. It is expected that joint meetings will be arranged amongst the various local sections of the scientific societies. The Secretary is C. A. F. Hastilow, Chenda, Bittall Road, Barnt Green, Worcestershire.

Bristol Section.—The session was opened by an address by the President at the University of Bristol, on October 11. On November 24, a meeting will be held at Exeter, when papers will be read by A. Marsden and F. Southerden. The Section President, R. D. Littlefield, will address a joint meeting on December 6 at Bristol on "Reminiscences of an Alkali Inspector"; on January 16, a paper on "Some Experiments with Water-finders," by Dr. J. Wertheimer; annual dinner in February; annual general meeting and election of officers, March 15. The local secretary is A. W. M. Wintle, 170, Newbridge Road, St. Anne's Park, Bristol.

Glasgow Section.—The annual meeting of the Section, which meets at the Royal Technical College, was held yesterday (October 25). The provisional programme includes a discussion on November 16; "Ramsay" dinner in December; joint meeting with the Society of Chemical Industry on January 25; and a joint meeting with the Ardeer Chemical Club in February. The secretary, W. M. Cumming, of the Royal Technical College, states that a publicity campaign has been opened in the West of Scotland, and articles on the importance of chemistry are now appearing in the local Press.

London Section.—Particulars of the syllabus are not yet available, but it is interesting to note that the Section has, during the past session, increased materially in number, the actual membership approaching 400. The sections of the Institute of Chemistry are able to levy a separate subscription, and there is in London, a second subscription of 5s. per annum, which indicates the interest of the members in the activities of their own section, the secretary of which is Leslie Collett, c/o the Institute of Chemistry, 30, Russell Square, W.C. 1.

Society of Dyers and Colourists.

London Section. — Arrangements for the forthcoming session are not yet fully completed, but a provisional programme has been prepared. The opening meeting was held on October 25 at the Dyers' Hall, Dowgate Hill, when a paper on "Hydrogen Peroxide Bleaching" was given by I. E. Weber. Further papers include the "Macbeth Artificial Daylight Equipment and the Fade-ometer," by A. A. Dashwood Lang; "Action of Micro-organisms on Fabrics," by Dr. Thaysen; and a paper on "The Use of Tetra Carnit in Stripping and Dyeing."

Leeds Junior Branch.—Meetings of this section are held on alternate Tuesdays in the Colour Chemistry Department of Leeds University. The number of members is being well maintained. In addition to the ordinary list of meetings, it is intended that "Junior evenings" shall form a feature of the session. At these meetings, members in turn give short papers on subjects of general interest, which provide material for discussion. The following papers have been arranged for, but the syllabus is not yet completed. On November 26, "Works Filtration," by Dr. Forster; "Shoddy Dyeing," by T. R. V. Parkin, on February 11; "Sulphur Dyestuffs," by F. L. Goodall, on March 3; and the annual meeting on March 17, when a paper on research work will be read by Professor A. G. Perkin. Later on in the session, visits to works in the vicinity are to be arranged.

Manchester Section.—The secretary of the Manchester Section, L. Thompson, 36, Palm Street, Slade Lane, states that the membership now totals 300, exclusive of 140 junior members, affiliated to the section. Most session meetings are held at the rooms of the Manchester Literary and Philosophical Society in George Street. The first paper was given on September 28, by Dr. Julius Rath, on "Naphthol AS"; followed by a meeting on October 19, when Professor R. Robinson lectured on "The Theory of Quinones." On November 16, a paper will be given on "Changes which Occur in Cotton Fabrics during Calendering and Beetling," by J. Huebner and V. Malwin; December 21, "The Dyeing of Cellulose Acetate Silk," by L. G. Lawrie; January 18, "The Fluorescence of Cellulose," by Dr. S. J. Lewis; February 15, "Some Physical Properties of Yarns," by Dr. A. E. Oxley, and a paper by Dr. R. G. Fargher; March 21, "Bi-polar Electrode Electrolysers for the Production of Bleaching Liquors," by Dr. G. G. Hepburn; April 18, "Identification of Insoluble Azo Colours on the Fibre, and of Azo Colours in Substance," by Dr. F. M. Rowe, and Miss C. Levin.

Institution of Rubber Industry.

London Section.—Meetings of this section are held at the Engineer's Club, Coventry Street, W., at 8 p.m. Two meetings have already been held, and on December 3, a paper on "Accelerators" will be given by Major V. Lefebure; January 7, "Consistency of Rubber and Rubber Compounds," by Dr. S. S. Pickles; February 4, "Rubber Latex in the manufacture of Boards, Leather and Linoleum Substitutes," by F. Kaye; March 3, "Life and Work of Thomas Hancock," by H. Rogers and B. D. Porritt.

Manchester Section.—The opening meeting took place on October 15 at the Midland Hotel, when H. C. Young, opened a discussion on "Rubber Machinery." On December 7, there is to be a joint meeting with the Society of Chemical Industry, when Dr. T. Callan will lecture on vulcanisation accelerators. Further meetings are to be held on January 21, February 18, and March 17.

Meetings have also been arranged to take place in Birmingham and Edinburgh, but full particulars of these are not yet available.

Hull Chemical and Engineering Society.

This society, which usually has a very attractive syllabus, holds its meetings in the Hull Photographic Society's Rooms, Grey Street, Park Street, at 7.45 p.m. On October 30, a paper on "British-made Dyes for Paints and Distempers," is to be given by G. B. Shaw; November 13, "Heating Mediums, Past and Present," by E. G. T. Hill; November 27, "Recent Advances in Colloid Chemistry," by A. V. Slater; December 11, "Recent Advances in the Study of Corrosion," by Dr. J. Newton Friend; January 8, 1924, "X-rays and their Application," by J. Pryce-Jones; January 22, "The Testing of Materials," by G. F. O'Riordan; February 5, kinematograph exhibition of living micro-organisms, with explanations by A. R. Tankard; February 19, "Manufacture and Testing of Portland Cement," by Miss D. J. Butterfield; March 4, joint meeting with the Chemical Engineering Group; March 18, "Anthracene and its derivatives," by Dr. W. Thevenaz; April 1, presidential address, "The Constitution of Coal," by A. R. Warnes.

ITEMS OF INTEREST.

Acetylene Congress in Paris.—The Eighth International Acetylene and Auto-Welding Congress will be held in Paris at the Grand Palais on December 13.

Committee on Food Preservatives.—It is announced that the Committee, which has already held a number of private sittings, will open the public inquiry on November 1.

Gifts for Research.—The General Electric Company of New York has given 5,000 dollars, and the British Thomson-Houston Company £250., for promoting original investigations at the Cavendish Laboratory.

British Coal Output.—The coal output at the mines of Great Britain for the week ended October 13 was 5,626,000 tons, against 5,528,400 tons for the previous week, and 5,254,900 tons for the corresponding week last year.

Tariff Notes.—Importation and exportation of opium and other habit-forming drugs is prohibited in Southern Rhodesia.—The duties on refined petroleum imported into British Guiana have been increased.—Anthraquinone may now be imported into Tunis duty free.

Canada and the Industrial Property Convention.—Canada has adhered to the Industrial Property Convention with effect from September 1, 1923. An Order in Council has been made applying to Canada the provisions of Section 91 of the Patents and Designs Acts, 1907 to 1919.

Norwegian Cellulose Products Exports.—According to official statistics, exports from Norway of cellulose and paper during the first seven months of this year amounted to 551,000 tons, which is 79,000 tons more than for the same months last year and 28,000 more than in 1913.

Chemical Industry Club.—The annual dinner of the Club takes place on Monday, November 26 next, at 7 for 7.30 p.m., at the Connaught Rooms. The price of the ticket is 15s., gratuities included, but exclusive of wine. The room in which the dinner will be held is capable of seating about 150.

New Water-resistant Glue.—The United States Bureau of Standards, in reporting experiments dealing with the use of glue in coating paper, says that results indicate that the water resistance of glue-bound coating containing chrome alum compares favourably with that of casein-bound paper containing no formaldehyde.

Artificial Silk Prices.—It was announced in the Press during the week that Courtaulds were about to reduce the price of their artificial silk by 33⅓ per cent., presumably to meet the competition of the British Celanese Company. This statement has been proved incorrect, but based upon the fact that Courtaulds are introducing into the market a new and cheaper form of artificial silk yarn for the jumper-knitting trade.

Amended Qualifications for Teachers.—The following qualifications are among those now accepted by the President of the Board of Education as the "equivalent" of a University degree for the purpose of regulating the pay of teachers under the Burnham agreement: Associateship of the Institute of Chemistry, provided that the Associate has passed the Institute's examination for Associateship; Membership of the Pharmaceutical Society, provided that the Qualifying and Major Examinations have been passed and followed by three years' professional experience; Associateship of the Royal College of Science; Associateship of the Royal School of Mines; and Associateship of the City and Guilds of London Institute.

The Metric System in Chemical Industry. — Under the auspices of the Widnes Scientific Society, on Wednesday week, Mr. A. E. Malpas, chief engineer to the United Alkali Company, gave a lecture on "The Metric System, with Special Reference to Chemical Manufacture." The lecturer stated that the outstanding advantage of the system from the chemical and scientific point of view was the numerical equivalence of the unit of weight (the gramme) and the unit of volume (the cubic centimetre) at unit density. Mr. Imison, who took part in the discussion, said that the metric system had been scrapped at the works of the United Alkali Company, and disagreed with the lecturer's contention that the metric system and the English system could not be used concurrently with efficiency.

Unemployment Return.—The number of registered unemployed in Great Britain on October 15 was 1,253,000, or 2,372 more than in the preceding week, but 231,978 fewer than on January 1 last.

Salters' Institute Grants.—The Salters' Institute of Industrial Chemistry has awarded 64 grants in aid to chemical assistants occupied in factory or other laboratories in or near London, to facilitate their further studies.

Belgian Metallurgical Activity. — The Belgian metallurgical works at Ougres-Marihaye have obtained a contract for 15,000 tons of rails for the South of Spain. The same company has just restarted two blast furnaces.

Rise in Dyers' Wages.—Following the rise in the cost of living as recorded in the *Labour Gazette*, the wages of operative dyers in Yorkshire and Lancashire will be increased to the extent of about 5 per cent. as from the first pay day in November.

New Lead Find in Derbyshire.—A new vein of lead ore near Matlock has been successfully claimed by Mr. T. Wright, formerly a director of the Mill Close Lead Mines. The christening ceremony was performed by the Barmaster, Mr. George Eagle, on Saturday last.

Mishap at Smethwick Glassworks. — An explosion occurred in a tank containing about 40 tons of molten glass at the works of Chance Bros. and Co., glass manufacturers, Smethwick, early this week. The works brigade, however, were able to deal with the fire that ensued.

Protection and British Sugar Beet. — Sir Robert Sanders, Minister of Agriculture, speaking at Bridgwater on Monday night, said the one bright spot in the situation regarding arable land was the success of the policy respecting sugar beet, because that was one part of our arable cultivation which enjoyed a protective duty.

The Life of Wrought-iron Boilers. — According to the annual memorandum issued by the Manchester Steam Users' Association, exhaustive boiler tests carried out by the Association have demonstrated that wrought iron does not deteriorate with age. Owners of old wrought-iron boilers need, therefore, have no fear that their pressures must be reduced, unless, of course, they have suffered waste and corrosion.

Government Inquiry on Unemployment.—The Ministry of Labour are undertaking an inquiry from employers regarding unemployment, with the object of obtaining at first hand from industrial concerns an estimate of the probable extent of unemployment during the coming winter. The form sent out asks each industrial concern to indicate how many workpeople it employed in the week ended October 13, 1923 (full or short time), how many during a representative week in May, 1920, how many could be employed if sufficient work were available to keep the entire works in full operation, and how many the firm expects to have in employment in January, 1924.

The Present Artificial-silk Position.—In a paper read to the annual conference of the Textile Institute at Leicester last week, Mr. P. E. King, of Leeds University, stated that Chardonnet silk is still being manufactured in France and America. Cuprammonium silk is also being made in Germany, but on the Continent the tendency is for viscose to supplant cuprammonium, and plants operating on the latter are being converted to viscose. Viscose forms the largest proportion of the total production of artificial silks, and is being made in ever-increasing quantities in this country, and especially in America. It is also produced in France, Germany, Italy, and several other countries. The manufacture of acetate silk is making headway in America. Mr. King estimated the total world production of artificial silk in 1922 at 79,738,000lb., the following amounts being contributed by the various individual countries: United States, 23,500,000lb.; England, 15,340,000lb.; Germany, 12,584,000lb.; Belgium, 6,292,000lb.; France, 6,292,000lb.; Holland, 2,516,000lb.; Austria, 1,573,000lb.; Switzerland, 1,887,000lb.; Hungary, 1,888,000lb.; Italy, 6,292,000lb.; Poland, 943,000lb.; and Czecho-Slovakia, 692,000lb. During this year, added Mr. King, it was estimated that the American production would be 7½ million lbs. more than the 1922 figure. "There is a growing belief," said the lecturer, "that artificial substitutes for silk will ultimately replace the natural fibre."

American Paint Works to Make Own Linseed Oil.—It is reported from America that the paint department of the E. I. du Pont de Nemours and Co. is considering the erection of a large linseed-oil factory at its Philadelphia plant. The firm use nearly a million gallons of oil per year, and has had the project under consideration for some time.

Sale of Copper by Portuguese Mint.—The authorities of the Portuguese Mint are inviting offers for 500 tons of electrolytic copper, in ingots, to be sold in five lots of 100 tons each. Offers must be lodged with the Administrator-General, Mint (Casa di Moeda e Valores Selados), Lisbon, not later than forty-five days from October 2, 1923. Further particulars may be obtained from the above address.

Objections to New Railway Rates.—Between fifteen hundred and two thousand objections have been lodged with the Railway Rates Tribunal against the schedule of standard charges presented by the railway companies. The objectors cover the whole ground, for a number have challenged the entire schedule, while practically every item is objected to separately.

Manufacturing Perfumer's Affairs.—At the London Bankruptcy Court, on Friday last, the public examination was concluded of Robert Henry Myer, 27, Lansdown Gardens, S.W., and carrying on business as the Ross Supply Company at 186, Wandsworth Road, S.W., manufacturing perfumer. The statement of affairs filed by the debtor showed gross liabilities amounting to £415., of which £411. was expected to rank against the estate for dividend. The net assets were returned at £196., thus leaving a deficiency of £215.

Colour Users' Brochure.—A pocket brochure, containing much useful information, has just been issued by the Publicity Committee of the Colour Users' Association. It includes lists of members of the various groups in the Association, American dyestuffs statistics, procedure in making applications for licences, German dyewares statistics, the Dyestuffs (Import Regulation) Act, 1920, details regarding reparation dyestuffs, and many other items of value to colour users and the dyeing industry generally. The contents are arranged in a convenient manner for reference.

Swedish Match Combine.—The Swedish match combine, Svenska Taendsticksaktiebolaget, announces that a new American company, the International Match Corporation, has been founded. More than half the share capital, which totals 28,000,000 dollars, is to be held by Taendsticks-aktiebolaget, which, in return, is transferring to the new company the greater part of its shares in foreign match industries. The remaining capital of the American company will be employed in the purchase of match mills in various countries of South America, the Far East, and in Canada. The new company will be controlled by the Svenska Taendsticksaktiebolaget.

COMING EVENTS.

Society of Chemical Industry (Glasgow Section).—Meeting, **Friday, October 26,** at **7.15 p.m.,** at the Institution of Engineers and Shipbuilders, 39, Elmbank Crescent, Glasgow. Paper: "The Industrial Chemist," by W. E. Moodie (chairman of the Section).

Physical Society.—Meeting, **Friday, October 26,** at **5 p.m.,** at the Imperial College, South Kensington, S.W. Papers: "The Fine Structure of Some Sodium Salts of the Fatty Acids in Soap Curds," by S. H. Piper and E. N. Grindley; "X-ray Analysis of Solid Solutions," by Dr. E. A. Owen and G. D. Preston; "Cohesion," by Dr. H. Chatley.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, October 26,** at **7 p.m.,** at 36, George Street.

British Association of Chemists.—Annual meeting, **Saturday, October 27,** at **3 p.m.,** at the University, Bournbrook, Birmingham. Annual dinner at Queen's Hotel, at **6.30 p.m.**

Hull Chemical and Engineering Society.—Meeting, **Tuesday, October 30,** at **7.45 p.m.,** at the Hull Photographic Society's Rooms, Grey Street. Paper: "British-made Dyes for Paints and Distempers," by G. B. Shaw.

Society of Chemical Industry.—Joint Societies' dinner, on **Wednesday, October 31,** at **7.30 p.m.,** at Hotel Victoria, Northumberland Avenue, W.C. 2. Application for tickets (limited to 300) to be made to the General Secretary of the Society of Chemical Industry.

Society of Chemical Industry (Newcastle-on-Tyne Section).—Meeting, **Wednesday, October 31,** at **7.30 p.m.,** at Armstrong College. Paper, "Milk," by H. R. Whitehead.

Society of Chemical Industry (Bristol Section).—Meeting, **Thursday, November 1,** at **7.30 p.m.,** at the University, Woodland Road. Paper: "Some Aspects of the Paint Trade: Fine-colour and Lake Making," by A. H. Bridges.

Society of Chemical Industry (Manchester Section).—Joint meeting, **Friday, November 2,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage. Address: "Electrometric Methods in Analytical Chemistry," by Professor W. D. Treadwell, of Zurich.

LEGAL INTELLIGENCE.

ARBITRATION IN THE CHEMICAL TRADE.

Scrimaglio v. Thornett and Fehr.

In the Commercial Court of the King's Bench, on Wednesday, Mr. Justice Greer commenced the hearing of an action brought by Messrs. Scrimaglio, merchants, of Genoa, against Messrs. Thornett and Fehr, of Leadenhall Street, E.C., which arouse out of a tallow contract and a soda ash deal.

Mr. Jowett, for the defendants, stated that the onus was upon him, as the Court had to try a preliminary point, as plaintiff's claim for £392. overpayment in respect of certain packages of vegetable tallow was admitted, subject to defendant's counter claim which arose upon two contracts by which plaintiff agreed to purchase from defendants 200 tons of soda ash, c.i.f. Genoa. Defendants alleged that the plaintiffs had committed a breach of the agreement by refusing to take up shipping documents that were tendered. In accordance with the terms of the contract, plaintiff's liability in respect of his repudiation was referred to arbitration. Defendants appointed Mr. Charles Mangold as their arbitrator, and, no arbitrator having been appointed by the plaintiff, Mr. Mangold heard the arbitration and awarded the defendants £4,800. damages against the plaintiff. Defendants now claimed this sum. Plaintiff's reply was a denial of liability for repudiation, saying that the only arbitration contemplated was an arbitration in London in the usual way and under the Arbitration Act, which meant by an arbitrator appointed by the Court. It was further said by plaintiff there was no concurrence in the appointment of Mr. Mangold, who had no power to make an award which was bad on its face. Plaintiff further said that arbitration in the usual way in London meant arbitration according to the rules of the British Chemical Trade Association, which meant that the arbitrator was appointed in accordance with their rules. Mr. Justice McCardie had ordered the issue whether Mangold's award was valid to be tried first. Defendant's case was that the habitual rule in the trade was by two arbitrators and an umpire. The British Chemical Trade Association's system was a reasonable one, and if one side failed to appoint an arbitrator, the other side might apply to the committee to appoint an arbitrator to fill the vacancy.

Mr. Emile Fehr, of great experience in the trade, and who said he had acted as arbitrator in thousands of cases, stated that he was a member of the defendant firm. The custom was to appoint two arbitrators and an umpire if the former disagreed.

Mr. Chas. Mangold, who acted as arbitrator in the present case, and is a chemical merchant of Mincing Lane, gave similar evidence, and the hearing was adjourned.

OXIDE, LTD.

A meeting of the creditors of the above was held on October 16. A statement of affairs was presented by the liquidator, Mr. R. Carpenter, which disclosed liabilities of £2,851. 16s. 2d., all due to unsecured creditors. There were also secured creditors, who were the debenture holders, for £500. and interest accrued £7. 4s. 8d. The assets were estimated to realise £1,181. 9s. 5d. After allowing for preferential claims of £8. 3s. 9d., and debenture holders' claim of £507. 4s. 8d., the net assets amounted to £666. 1s., or a deficiency as regarded the unsecured creditors of £2,185. 15s. 2d. The share capital issued and paid up consisted of 2,500 6 per cent. preference shares of £1. each and 2,500 ordinary shares of £1. each, so that the total deficiency as regarded the shareholders was £7,185. 15s. 2d. It was eventually decided to confirm the appointment of Mr. Carpenter as liquidator, with a committee of inspection.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN SEPTEMBER.

(Concluded from page 466.)

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of Sept., 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the Returns.
